Secured only with
welds like THIS

UNHARMED BY WATER, STEAM OR CHANGE OF TEMPERATURE

Dick's Belts are guaranteed to run through water, or steam, if necessary, without injury and to be unaffected by changes in temperature. They have been applied with signal success to every variety of work for which belts are used. Saw Mill owners find Dick's Balata Belting the cheapest when length and quality of service are considered. Catalog No. 17 on Transmission Appliances tells all about it.

DICK'S Balata Belting Leather Belting Wood Split Pulleys Shafting Hangers Iron Pulleys

THE BELT YOU WILL EVENTUALLY USE

BECAUSE—It withstands heat, cold, damp, wet and chemical fumes.
BECAUSE—It is uniform in thickness and runs true.
BECAUSE—Of its great strength, almost twice that of oak-tanned double leather.
BECAUSE—It costs no more, all things considered.

THE LEADING STOCK LINES IN ONTARIO

1914

*Wishing a Happy and Prosperous New Year
to the Trade*

MR. DEALER,

Start the New Year right,

Turn over a New Leaf.

Get the **Price** the amount your purchases warrants.

If you handle 1000 doors a year, buy them on a

Midland Door Contract,

and get the Price your Business deserves.

If you handle **ten thousand**, get the price on ten thousand. Don't pay extra prices on a lot of small orders. Not when you can get the Best Line of Doors in Canada, with the Best Prices from us, on a MIDLAND DOOR CONTRACT.

We Strive to Please our Customers

While we cater to Stock Lines, we manufacture all kinds of millwork at Reasonable Prices, and can take care of all your wants. It pays to buy from us.

Write to-day for our Door Catalogue, and a sample MIDLAND DOOR CONTRACT, stating how many doors you handle per year, and the style door you prefer. *It won't cost you anything to see what the Contract looks like.*

WRITE TO-DAY.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 16-ft. Slash table. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 2 Lath Trimming Saws. | |
| | 1 24 x 36 Slide Valve Engine with 40-in. x 12-ft. extra heavy double arm split fly wheel. |

- " " carry your men to work and leave them fresh for the day's work.
- " " draw themselves over rapids and portages.
- " " can be used for warping and sweeping logs out of corners that an alligator could not reach. *Our literature gives full particulars.*

Adams Launch & Engine Co.

Penetang, Ontario

 GOOD YEAR

HOSE

For Greater Protection---For Longer Wear

¶ The Goodyear Hose-making equipment is the most up-to-date in Canada. We have the latest improvements known to the trade. Every process is under the control of experts, who know the Goodyear requirements and see that a uniformly high standard of quality is kept up.

¶ We take no chances with the raw materials. A stringent laboratory examination determines the quality of the raw rubber. The hard long-fibre cotton which is specially woven for Goodyear Hose-making is submitted to tests for strength and weave.

¶ The walls of the hose are composed of long strips of cotton fabric thoroughly impregnated with rubber or friction. And cut on the bias to resist expansion, bursting and elongation. This friction-impregnated fabric is rolled under great pressure, which ensures a perfect union of the plies.

SUCTION HOSE

¶ We build into Goodyear Hose the same strength and indestructibility as have made Goodyear Rubber Belts famous. Goodyear Suction Hose is steel-wound internally to guard against collapse. The coil is of round or flat wire, and round it the hose is built up, ply upon ply of rubber-permeated cotton fabric. This fabric is made from special hard-staple long-fibre cotton, and is cut on the bias to give strength and hard wear.

¶ Goodyear Suction Hose is made for every purpose—and can be had rough or smooth bore. Is in service throughout Canada—on wrecking and dredging contracts—in factories and mines—on farms and in saw-mills. Special hose made for sand-sucking, oil, gasoline, vinegar and acid, wine, etc.

STEAM HOSE

¶ Steam Hose gets more hard usage than any other hose. In the Boiler Room it lies around near the furnace and is scorched—a hot firing tool is carelessly thrown down upon it—oil is spilt over it.

¶ Goodyear Steam and Hot Water Hose is made with special heat resisting lining, which keeps the extreme heat from the friction fabric. This gives the extra durability—it will stand up well under hard usage. In its manufacture the materials undergo special treatment to resist oil—so destructive to common hose. The rubber and duck used in Goodyear Steam Hose are specially tested for service under high pressure of steam and hot water. We supply it steel wire wound or marine jacketed.

GOODYEAR MILL HOSE

¶ When Mill Hose is wanted it is wanted badly. To find that your Mill Hose has cracked and rotted while lying idle is serious. "Goodyear Underwriters" is always ready for effective service. We build this hose to meet the requirements of the Associated Factory Mutual Fire Insurance Companies. It bears the required stamp of approval "tested to 200 lbs. pressure." The inner tube is made from NEW Rubber of the highest grade, uniform in thickness and quality. The cotton fabric is of special circular web woven to the Underwriters' specifications for a minimum of expansion or elongation under pressure. It is antiseptically protected against rot and mildew.

¶ For Factories and Mills the "Goodyear Underwriters" is a hose which will lower insurance rates, and cannot be excelled in durability and strength. You see it everywhere—the hose with the black and yellow stripes.

 GOOD YEAR

RUBBER HOSE

AIR HOSE

¶ With fair usage Goodyear Air Hose will be found proof against internal decay from oil—breaking away of pieces of the tube—and clogging of the machinery. The lining is made from selected rubber and cured to prevent hardening from the heat and pressure.

¶ Goodyear Air Hose will give good service under intermittent pressure.

¶ In mines, engine and boiler works, steel construction contracts—wherever pneumatic tools are being operated you will find Goodyear Air Hose. Wire or marine winding or marine jacket.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Toronto, January 1, 1914

No. 1

Much Timber Felled by Storm

Reports which have been received by the Department of Lands, Forests and Mines of the province of Ontario, indicate that the damage caused by the gales which prevailed on November 9th and 10th, was widespread and of a very serious nature. So extensive was the damage that it has become necessary for the government to take steps for having the timber taken out of the woods, so as to prevent the loss which would occur if it were left there throughout next summer. The force of such a storm is beyond the imagination of anyone who has not seen its effects. The damage and loss of life on Lake Huron showed that the storm approached closely to the proportions of a hurricane. The fact that it laid low many million of feet of sturdy timbers which had withstood the storms of former decades, shows that it was by far the greatest storm of its kind that has occurred in Ontario for a great many years. The extent of the country over which the storm raged makes it all the more remarkable showing that it was not of the cyclone class, but a gale of enormous proportions. Its greatest severity was through the country lying north of Lake Huron and extending from a little north and east of Sault Ste. Marie, as far east as the township of Merrick on the Temiskaming and Northern Ontario Railways. Throughout this territory more or less damage resulted and on limits which were, for special reasons, more directly exposed, the damage was very great. Thirty-four townships, on which the lands are under timber license, suffered more or less and the owners of the timber are facing the necessity of taking it out before the borers get at it next summer and make it a total loss. This will involve considerable additional expense as compared with the cost of ordinary lumber.

The government has suffered by reason of the timber felled in the Mississauga forest reserve, some of which have been bought by the thousand feet, operators paying for it only when it is cut. The

government will therefore be the losers if any of this timber is left on the ground throughout next summer. In this reserve the worst slash, so far reported, took place and inspection is now proceeding with a view to locating all the damage and having the timber removed during the present winter. Operators working in this reserve will feel that they are entitled to considerable concessions if they are to take out this timber, as they cannot be expected to accept it at the prices under which they were formerly operating, because the expenses will now be much greater. The reports show that four townships, including eight limits, were badly damaged in this reserve.

The fact that the government is taking immediate steps to provide for the removal of the down timber is of great importance. While it will mean the prevention of great loss, it will also involve the production of a large quantity of lumber during the next sawing season, which would not otherwise have been cut. Whether this will be an advantage or not, no one can say, although, if business activity returns next summer it is quite possible that the market will be able to take care of any moderate over-production. Under present trade conditions however, over-production would be a very serious matter and would have a depressing effect upon prices. The indications already received regarding the cut of logs in the woods during the present winter give reason to believe that most of the operators are counting upon taking out at least as much as they did last winter. If logging conditions become good it is likely that the cut of last winter, which was light, will be exceeded, without consideration of the timber which has been brought down by the storm, and that with this added, there will be a considerable increase.

These are conditions which ought to be understood as fully as possible as soon as the facts can be ascertained. For this reason lumbermen are hoping that the government will complete its investigations into the amount of fallen timber and announce its plans for removing it as quickly as possible, so that all doubt may be removed. Already arrangements have been made for taking out the fallen timber in the townships of Dana and Janes and on McGregor Island. Other sales will probably have to be made. Whatever steps the government takes, it is certain that lumber manufacturers and the public generally will commend them if the situation is handled promptly and the timber disposed of as soon as definite facts can be secured regarding its quantity and location.

The Timber Trade of Australia

A valuable report upon the timber trade of Australia during the years 1912 and 1911 is published in the Department of Trade & Commerce's weekly report for December 22nd. The total imports of timber (lumber, etc.), into Australia in 1912 were valued at £2,852,623, showing an increase over 1911 of £64,671. The decrease in the imports from Canada to the extent of £50,406 is attributed to a curtailment in shipments of Douglas fir from British Columbia. Inversely, the increase of £218,960 in imports from the United States is stated, by experts, to be chiefly of the same class of timber, for which mills in Washington and Oregon States quoted lower c.i.f. rates than Canadian exporters. Imports from New Zealand increased by £80,554, while those from Norway declined by £121,132, from Sweden by £14,838, and from Russia (Siberia) by £62,629. The importation of logs from Japan and Siberia shows substantial contraction in values

Retail Methods Contest—Date Extended to February 1st

The last day for submitting articles in the retail methods contest has been extended to February 1st. A number of interesting articles have been submitted already, but holidays have prevented some from entering the contest who had intended to do so and we want to hear from them all. Read the conditions published on page 38 of this issue and try to win one of the prizes.

due to the business, through high freights and other causes, not proving remunerative.

A table published with the report shows that the imports of timber from Canada during 1912 were valued at \$70,922, whereas in 1911 the value was \$121,328. In 1912 Canada was sixth on the list of countries from which timber imports were received in Anstralia. The United States came first with a total value of £1,314,314. New Zealand was second with a total value of £656,925. Norway was third with a value of £370,975. Sweden was fourth with a total value of £228,416 and Russia was fifth with £87,784.

Imports of wood articles and minor lines of timber into Australia during 1912 were valued at £101,371, of which Canada is credited only with £2,518. Screen doors and window screens contributed a small amount of this trade, but the heavy import charges and high customs duties gave local makers the bulk of the business. A small trade is done in Canadian tool handles. The trade in picture mouldings and veneers has, so far, proved unattractive to Canadian manufacturers. Among the imports of wood articles and minor lines of timber, the following are included:—Doors, 1912, £3,838, 1911, £137; tool handles, 1912, £44,237, 1911, £52,573; elm hubs, 1912, £5,339, 1911, £8,405; picture mouldings, etc., 1912, £34,882, 1911, £37,181; hickory spoke rims, etc., rough, 1912, £10,760, 1911, £19,077; hickory spokes dressed, 1912, £10,829, 1911, £20,969; shooks, 1912, £1,842, 1911, £1,563; box timber cut to size, 1912, £29,004, 1911, £8,714; three-ply veneers, 1912, £40,333, 1911, £22,530; other veneers, 1912, £2,046, 1911, £3,265. Imports of undressed timber in sizes less than 7-in. x 2½-in. from Canada during 1912 amounted to 3,116,707 superficial feet as compared with 6,087,411 superficial feet in 1911, showing that Canada's trade in this line fell off by nearly 50 per cent. The United States sent to Australia in 1912, timber of this class to the extent of 55,612,914 superficial feet, which was a slight increase over 1911, when the total was 55,319,403 superficial feet. A remarkable increase in imports of this class from New Zealand was shown, the total for 1912 being 17,041,159 superficial feet, as compared with 644,338 superficial feet in 1911. The total trade under this class during 1912 was 77,616,473 superficial feet and in 1911 65,223,790 superficial feet.

Undressed timbers in sizes from 7-in. x 2½-in. up to 12-in. x 6-in.

were imported from Canada to the extent of 4,798,194 superficial feet in 1912 as compared with 6,940,349 superficial feet in 1911. The imports of this class from the United States amounted to 49,449,918 superficial feet in 1912 and 44,344,141 superficial feet in 1911. A great increase also occurred in imports in this line from New Zealand, the total being 4,097,556 superficial feet in 1912 and 110,187 superficial feet in 1911. Decreases were shown in the imports of this class from Norway, Russia and Sweden.

Undressed timbers in sizes of 12-in. x 6-in. or over were imported from Canada during 1912 to the extent of 4,138,547 superficial feet, whereas in 1911 the total was 12,777,341 superficial feet. From the United States the imports of this class showed a great increase, the total being 118,313,751 superficial feet as compared with 89,258,145 superficial feet in 1911. New Zealand sent timber of this class to Australia to the extent of 2,134,210 superficial feet, whereas none is shown in the reports for 1911.

An extensive import trade was done in "logs not sawn and spars in the rough," but Canada did not figure in this trade. The largest quantity came from Japan and the next largest from Russia. The United States figured only to a very small extent. The total quantity was 18,901,739 superficial feet as compared with 29,902,216 superficial feet in 1911. New Zealand pine was imported to the extent of over 70,000,000 superficial feet as compared with 84,500,000 superficial feet in 1911.

Under the heading of "timber for making boxes and doors," the imports from Canada amounted to 465,704 superficial face feet as compared with 174,614 superficial face feet in 1911. The United States sent timber under this heading to the extent of 550,774 superficial face feet as compared with 97,068 superficial face feet in 1911. Laths were imported from Canada to the extent of 3,540,870 pieces as compared with 3,910,960 pieces in 1911. Imports of laths from the United States amounted to 26,090,876 pieces in 1912, compared with 26,302,134 pieces in 1911.

The Canadian Trade Commissioner at Melbourne, Australia, Mr. D. H. Ross, states in his report that special enquiries from Canada relative to Australia market conditions on any line of lumber or woodware will invariably receive careful and prompt attention at his office.

A Great Lumber Consuming State

Since the passing of the new tariff law in the United States, which permits the entry of lumber from Canada, free of duty, there has not been much public discussion of the advantages involved to Canadian lumber manufacturers. Apparently the period of dull business which has settled upon the United States and Canada, has offset, for the time being, any advantages which might have been expected. There have in fact been some expressions of opinion to the effect that the change in the tariff will involve no material advantage to the lumber industry in Canada. It is hard to believe that this will be the case. When business conditions again become active, we may expect to see an important increase in the demand for various classes of lumber produced in Canada, which are required in the markets of the United States.

That this will be the case is forcibly indicated by a report recently issued by the New York State College of Forestry at Syracuse, dealing with the wood-using industries of the State of New York. The first idea that comes to a Canadian upon reading this report is that the tariff has opened wide to Canada the doors of the greatest lumber-consuming market in North America. If the freedom of this market is of no advantage to Canadians, it will be a strange and unaccountable matter. The extent of the market in New York State will be appreciated by a lumberman, when he learns that it uses each year over 1,750,000,000 board feet of lumber. This is three hundred and sixty-five million more than the production of the whole province of Ontario during the year 1912. In other words the State of New York uses annually as much lumber as Ontario produced in 1912 and one million feet per day in addition. The year 1912 was an off year in the production of lumber in Ontario, but in the year 1911, the total was 1,716,-

849,000 board feet, or about sixty million board feet less than the annual consumption in the State of New York.

The value of the lumber consumed in New York State during one year is \$55,000,000, and of this total, only thirty-one per cent. is paid for wood produced within the borders of the State. The purchases of lumber from outside the State are therefore valued at \$37,950,000, which represents the demand that Canada has a chance to help satisfy. Canadian lumber could not fill this demand in its entirety, as it is a very varied demand and attracts lumber from all parts of the globe, especially from other states of the Union. But Canada's chance, now that the market is wide open, is as good as that of any other state or country and better than most of them at present, because of the nearness of the market to the great producing provinces of eastern Canada. With the Panama canal completed in the course of a few months, the lumber manufacturers of western Canada will also have cheap rates of freight to the eastern seaboard and will become an important factor in the markets of New York State.

It is interesting to note some of the chief points brought out by the report upon the woodworking industries of New York state. In the year 1850, New York led all the other states in the production of lumber. Rapidly increasing population and tremendous advancement in the development of the industries using wood, have caused a very material increase in the consumption of all kinds of forest products, so that to-day, New York State has fallen from her position as leader in the production of lumber until she is twenty-third in the list. From the position of leading producer she has now become the leading consumer and uses immense amounts of Douglas fir, western cedar, Cali-

fornia redwood, yellow pine, southern cypress and white pine from Michigan, Minnesota and Canada.

The New York State College of Forestry in preparing this report have had chiefly in mind its usefulness as an indication of the urgency of the demand for forestry practice within the state. With a vast area of twelve million to fourteen million acres out of the total of thirty-three million acres, better suited to forest crops than to anything else, it is plain, says the report, that the state will produce all of the lumber and other forest products required, when it practices forestry on its land. In the meantime Canadians may, however, count upon a steadily increasing demand for their lumber products in New York State.

The variety of uses to which lumber is put in the State is very large. Woodworking establishments are turning out everything from large structural timbers down to the finest dowels, tooth-picks and pegs. Surprising quantities of wood are being used in such unusual articles as wooden shoes, wood fibre plaster, toys, novelties, spools, all sorts of handles, etc. One of the most interesting and significant facts brought out by the report is that slabs and waste material, form-

erly burnt up or left to rot in the woods are being used in many effective ways, such as for making toys and other small articles and acid and other chemical products.

The State College of Forestry takes an optimistic view of the situation and believes that New York will return to her original important position as a great producer of forest products. If the State produced its own wood entirely, it would keep more than twenty million dollars a year within its border, making its people richer, covering its idle land with a producing forest, preserving its water flow, as well as its game and providing recreation places for the people of the great cities. This is a pleasant dream of the future, but it is also the ideal which is being vigorously approached by forestry supporters in the State of New York. It is an ideal which, sooner or later will be sought in many other cities and also in Canada. It does not involve, however, any necessary lessening of the demand for lumber from the other cities and from Canada, because the population of New York State and of all the United States must still increase enormously and provide markets for any exportable surplus of lumber that Canada can produce.

Lumbermen and Architects

Anyone who sells lumber has given thought occasionally to the fact that those who are responsible for the use of the lumber frequently are not sufficiently conversant with its characteristics to get proper value out of it. The most glaring instance is probably the architect. There are architects and architects, and some of them make a point of studying the uses and characteristics of lumber in such a way as to be able to specify it intelligently. There are too many architects, however, who do not give lumber the consideration which it deserves. An occasional effort is made to stir them up to the importance of the matter, but results are not encouraging. The difficulty is, to some extent, the fault of the architects, but lumber manufacturers and wholesalers are also partly at fault and have an opportunity of improving matters which they do not take advantage of. Architects have a natural desire to produce creditable buildings and if lumbermen were to take the same care to educate them about the uses and characteristics of different kinds of lumber the result would be a better appreciation of its value and an improved demand. One lumberman cannot do much along these lines, but a body of lumbermen can. The Canadian Lumbermen's Association, which is to hold its annual meeting at Ottawa next month might profitably consider ways and means of conducting a campaign of publicity among architects. This would be a practical business step, in keeping with the methods frequently adopted by other manufacturers of building materials, with remarkable success.

Along this line it would be possible to meet successfully, not only the competition of other building materials, such as cement, patent roofing, etc., but also the competition of foreign woods both soft and hard, with native woods. Hemlock, pine and spruce manufacturers, by the devotion of a comparatively small amount of time and money to such work could get better results than by a century of individual effort.

Something along this line was recently carried out by the lumbermen of St. Louis, Mo., where the Lumbermen's Club entertained the architects of the city and after feeding them acceptably impressed upon them some facts regarding lumber that are commonly overlooked. The architects were quick to admit that the lumbermen had performed a real service on their behalf. The American Lumberman, discussing this event editorially says:—"The truth is that lumbermen as a class have too often assumed that 'whatever is is right,' or at any rate unchangeable, and they have rarely in a diplomatic and systematic manner attempted to educate users and specifiers of lumber regarding its wide adaptability. Lumbermen honestly believe that lumber is better for many purposes than some other materials that are used, and they know that carpenters and finishers do not by any means always get the best results that are easily possible when they are using wood.

"What was done for the architects of St. Louis might properly and profitably be done for the same and other classes elsewhere. The work should be carried into all channels of use through which wood should find an outlet, and the persistent attitude of the lumberman should be that his product is the most tractable and adaptable of structural materials.

"He should go further and see to it that the wood he sells is adapted to the use to which it is to be put; or, expressed in another way, that the wood bought for a particular use is adapted to that use. Much of the prejudice against wood is due to carelessness in this respect."

Many lumbermen have expressed precisely the same view to the Canada Lumberman in conversation, but no one ever seems to adopt the idea or try to push it. It is a valuable idea, which ought to be put into effect at once.

Editorial Short Lengths for Busy Readers

H. R. MacMillan, chief forester for British Columbia, reports that the forest fire damage during 1913 was the smallest in the history of the province. Practically all the eastern provinces, especially Ontario had been heavy sufferers again this year from the fire scourge, he reports, and while the weather was responsible for a share of the credit in British Columbia, the efficiency and organization of the Forest Branch of the Department of Lands had been an important factor in the excellent record made this year. The British Columbia Forest Branch now has a staff which, including forest guides and patrolmen on duty numbered 415 during the past summer. Thirty rangers and 280 guides protected the forests from fire, while eleven district foresters and twenty-three forest assistants were largely occupied with this work. Fifty-one of the staff of 415 were railway patrolmen, part of whose wages were refunded to the government by the railroads at

the close of the season, and in addition there were about sixty railway employees who were employed on patrol duty.

According to the annual statement of the traffic of the Lachine Canal, Montreal, the largest tonnage up, in single commodities, was in pulpwood and pulp, the former measuring 126,938 cords, equal to 380,814 tons, and the pulp weighing 13,100 tons, a total of 393,914 net tons. Pulpwood showed an increase of 45,178 cords and pulp a decrease of 16,242 tons. Two cargoes of pulpwood were brought from Norway during the season, one of 1,331 tons by the new lake steamer Glenfoyle, and another of 1,400 tons by her sister ship, the Keyvive. Lumber sent up into the canal-basin totalled 101,479 tons; and down, 146,345 tons.

Talks With the Lumbermen of British Columbia

No. 4—By Douglas Fir

ALL through these talks, let it be understood that it is not the intention of the writer to be found pointing an incriminating finger toward any one in particular, but rather that the broader view shall be taken, which is the correct one, that the only incentive of the writer in giving expression to his views on the different phases of the perplexing questions with which we are constantly being confronted is, as has already been stated by the editor, a bona-fide effort on the part of the writer to help those who are in error to see the utter fallacy of trying to pursue further the course which we have been following in some stages of the game, as well as to promote the direction of more earnest and concentrated thought all along the line toward saner and more practical methods, which may be hoped to bring about at least some good to all who are engaged in the industry without doing harm, or giving offence to any. It would require more ability than the writer is possessed of, to enable one to deal at any length with a subject having the importance of this one, and affecting as it does, so many people, without hitting some one; and indeed, it does not seem as though his thoughts would be well directed, or his efforts worth while if nobody was hit. Contrariwise, it is the conviction of the writer that there is too much studied effort in these days by men upon whose shoulders responsibility should rest, to say the things only which will soothe and satisfy the superficial mind, but which do not satisfy the mind that delves down deeper into the facts and realities of the question at issue. When, however, it is understood by the reader that the only ambition of the writer is to be helpful to those engaged in the industry, may it not reasonably be hoped that nothing but good intentions will be seen in these remarks by those who may read them? The writer does not lay claim to being the centre of all the light that shines along the pathway of our pursuit, nor does he presume to offer a panacea for all the ills with which our industry is suffering, but what light he has, he is ready and willing to share with others, and if his efforts are reciprocally met in these columns, and all feeling of resentment and derision dispelled, at least some good should be accomplished.

Time Has Arrived to Study the Situation

"Never, perhaps, was the pride of our brethren more humiliated, nor the heart more completely subdued" was the opening remark of my first letter to these columns upon the subject of our lesson. When I placed those thoughts upon paper I had in mind a state of humiliation, and of subduement, which was partly of our own making, and partly due to causes which are beyond our control. Neither by those words, nor by any other remarks which I have made, or may make, do I wish to be understood as having said that we cannot conduct our industry properly and successfully, and compete with others who are similarly engaged. I am quite willing to admit that we do not compete with our neighbors across the line, for instance, but I am not willing to admit that we are unable to do so, but on the contrary I say that we can do so, and we should do so, and when anyone says that we cannot compete, nor hope to compete with the American mills, and this is quite freely stated by some, then I think it is time that some of those people should come forward and tell us why, with the same class of machinery and the same chance to select and employ brain and muscle, with no disadvantage in location, and with cheaper and better logs, we are still unable to claim our proper place in the front ranks with the best of them. If it is true, as some have already admitted, that we are not able to compete, either in quality or cost of manufacture, then here is an important lesson which we should lose no time in learning, and the greater is our shame, and the more degrading our humiliation for not having learned it long ago.

I believe that if success is expected to follow any undertaking, it is necessary that we should find sufficient pleasure in said undertaking every day to cause us to devote proper thought, and expend the right kind of energy to achieve success. One of the greatest hindrances of success in the present day is that pleasure is not associated enough with the work as the days go by, but too often only calls around on the day that the pay envelope is handed out, and this does not apply alone to the ordinary workman, but equally or more elsewhere, for do we not often see indifference exhibited by those who should be the dominating force, or generator, as it were, in their respective concerns, of that flow of knowledge which should be constantly and unsparingly diffused throughout the different circuits of our organization, and which should be so alloyed as to fuse the different circuits, or departments into one at the proper fusing place, thus precluding the possibility of what I term short circuiting, or one department cutting into another at the wrong place. Do we not, I ask, too often see

this force grounded as it were, and running rampant with pleasure and vainglory in other directions? There is nothing more important than this fusing in the proper place, and then keeping the wires loaded to their capacity with energy.

Jumping at the "Rush" Order Bait

Some managers, and sales managers seem to think that the best way in which this energy can be supplied, so as to keep a constant pressure all the time at the manufacturing end is by reaching out after those orders which are marked with such a big "RUSH" that perhaps the saner, or more practical heads of other mills have passed them up. The inexperienced jumps at them, because you know it keeps their workmen under pressure. Could anything be more fatal to best results? If these men were capable of understanding the sacrifices that are made of valuable material, they would probably change their views, but usually such men think they know, and so they must know. Instead of this enthusing the practical men in the mill, who are forced to do these things against the dictates of their better judgment, it more often has the opposite effect, and acts as a deterrent to their energy. What some of the men who seek to supply that kind of energy in order to bring about big results, don't know about the business in which they are engaged would make a very much larger book than would what they do know. My last letter to these columns showed in this connection how heavy losses could be incurred, often running into thousands of dollars per month in a mill of good capacity, by this kind of energy, so I will not go into figures here, but suffice to say that the subject is worth thinking about.

Many a man who has money invested in our industry at the present day feels that he has invested in a "gold brick," while in reality he has done nothing of the kind, but has invested in a legitimate and honorable business which is only brought into disrepute by such causes as the above and others, which in other pursuits entailing such large capital expenditure would not be allowed to exist.

If I were to start in to build battleships, or other craft, it would make no difference how many millions I might have behind me, it would only be a question of time when the undertaking would prove a failure, because I do not know anything about building ships. Yet how many people do we see go into the lumber business, and perhaps assume the management of their own or their friend's investments without having had any experience in the business whatever, and still these people expect to compete with those having years, or perhaps life long experience. It is right along here that many of the jagged rocks are found, and many a comparatively safe craft has had her paint scraped upon them.

The Importance of Business Sense

I believe that there is probably as much to be learned about the construction and successful operation of a large lumbering industry as there is about ship building, and since history repeats itself with such frequency in the lumber business, does it not seem as though, if all those who have to do with the management of our lumbering concerns were experienced in the business, much of the presently existing danger of being dashed upon the rocks of overproduction could be avoided and many of the wrecks, whose remains are strewn along the sands of time, have been prevented. Being old and experienced navigators they would understand the signals, and would take heed in time, to anchor in safety behind the rock of common sense, and this could have none other than the effect of pouring oil upon the troubled waters, and the fury of the storm would be of short duration. Of course I know that there are always some reckless ones who might venture out, and thus prolong the siege, but they would be comparatively few who would do so without cause, and if right conditions existed, and common sense prevailed they would have no excuse.

It is a poor apology, it seems to me, for running our mills double time in the face of a weak, or declining market, to say that we must do so in order to reduce our overhead charges, and protect our stock, or bondholders, and right here, for the sake of argument let us make some theoretical calculations, which may to some seem far fetched, but which will serve as illustrations. Let us suppose that I control a sawing capacity in one, or several mills aggregating 500,000 feet of lumber per day of 10 hours, and I conceive the idea that by running day and night I can reduce my overhead charges \$1.00 per thousand feet. I do so, and I make that reduction. I am now sawing 1,000,000 feet in the two shifts, but I find that the market cannot take care of the excess over the natural output, and competition being keen, the buyer has taken cognizance of the situation, and has noted the effect that my

action must have. Consequently, anxiety on the part of the buyer ceases, while that of the manufacturer increases, until soon we find that the prices at which sales are being made are \$2.00 per thousand feet lower than before I started to run double time. What have I gained. I have actually lost \$1.00 per thousand feet in my own operations, and have caused my neighbors to lose \$2.00 per thousand feet on their operations, because I have pulled the price down that much, and their methods are unchanged.

Nothing Lost By Trimming Sails to the Wind

If I could speak so that all the lumbermen in the Dominion and those that are to come could hear me, my advice would be to get together and study the waters that are to be navigated, and never attempt to fly more canvas than the ship is rigged for. I can see no good reason why our industry can not be kept comparatively healthy, if it is conducted with a view to taking care of our own interests, instead of letting our greed so blind our eyes and understanding that we militate against ourselves. I believe that, if there is not sufficient business to keep our mills running throughout the whole year, some concerted action should be taken for closing for a period each year, the same as they do in the east. I believe that we should start out with the right amount of canvas to enable us to do this, and never should we be found carrying so much canvas that we could not stop in safety before an approaching storm. I believe that we should so trim our sails that we could afford to do this, and as I have already shown, we would not lose anything thereby. When we stop and think of it, this seems like a simple solution of the difficulty, for we could then not only be practically assured of a steady market, but we would also steady the nerves of the logger, which in itself is a matter worthy of thought. Now, there is uncertainty throughout the ranks, but if we could decide upon such an arrangement as the one described for tying up as soon as we saw a storm approaching, everybody would know what to expect, and in all likelihood the storm would blow over without doing any damage.

When we stop and compare eastern men and their methods with our own, is it not apparent that more thought and attention is given to the management of affairs there than here, by those who are actual investors? There they have to plan a year ahead all the time. They were planning, and actually working months ago on their log supply for next year's operations. But this is not all the difference we see, for amongst the characters conspicuously emblazoned upon our memories as mill men of the east, have we not read with regret how one in his 88th year was injured while directing men in the works? Necessity did not drive this man to do that, for later did we not see him writing his cheque for \$125,000 for a charitable institution? We who have watched him closely have found that his greatest pleasure has been in directing his business, and while he has had plenty of setbacks, yet he has weathered the storm. He is a natural born director. Long may he live to enjoy the fruits of his labor.

Things are different here. It is more of a hand-to-mouth game with us. We do not have to plan our log supply so far ahead; are not dependent upon snow to get the logs out of the woods, nor upon spring freshets to get them to the mills, and yet with all our advantages we admit that we are unable to cope with conditions. Practice in the east has almost invariably been to acquire timber holdings, and then begin operations modestly, and in this way build up a business on a sound basis, adding to and increasing as conditions demand, and producing much of the capital, as they have gone along, with which to increase their operations. Here, we acquire the capital, and timber perhaps, then we build and equip a large and fully arranged plant, and then demand suitable conditions, and while nature by her slow process is bringing those conditions about, the interest is eating us up.

Bad Business Habits Soon Become Chronic

As we are passing by the sales department let us have a look in and see what some are doing here. There are times when it is interesting to look into some of these places. Does it seem reasonable that any one should resort to the practice of changing the grades in order to secure business? It is common knowledge amongst salesmen that this is often done, and business is obtained and held by giving the customer higher grades than those figured in his bill. This is only one of the methods resorted to. There are many more, but I believe this is one of the most common, and I fully believe that it is more common than many of us are aware of, and is carried on to such an extent whether prices are maintained or not, that it is now considered by many to be a diplomatic trait, or accomplishment, without which the salesman can hardly be successful. This is all wrong, and only goes to show another weakness which is prevalent here, that is not found in other business. Just as practice becomes law, so is this custom fastening itself upon us, until soon it will be considered as a legal demand. Some may think this is not true, but it is true notwithstanding. Resorting to any such tactics as this in figuring a bill only denotes weakness, and inability on the part of the salesman to clinch the order by correct methods, and by convincing the customer

that he is ready to give him a square deal, and that he expects the same. There is much work to be done by way of re-adjusting these things, and re-educating the trade, which ought to be done. No salesman should be allowed to employ any such methods, and it should be made a criminal offence against his employer.

We have certain prescribed rules governing the amount of sap that is allowable on the different kinds and grades of lumber, but as yet we have nothing laid down for our guidance as to how much sap is allowable on the surface of a salesman before he is reduced to a lower grade. I often think of this when I see a salesman meet a prospective customer, and salute him as some of them do after this fashion, and in his own familiar way, "good morning," "what do you know?" To which I have heard the customer reply, perhaps more in disgust than otherwise, "I don't know anything." This always reminds me of a young man who was sitting near me on a steamer one time. He was sitting there apparently in a deep study when an acquaintance came along and stopping, asked him "what have you got in your head now young man?" The other looked up and calmly replied "nothing Sir, absolutely nothing." Now, if, when this salesman walked into his prospective customer's office the salutation had been something like this, "God morning Mr. Brown," "good morning Mr. Jones." "I must apologize to you Mr. Brown for being later than I expected, I was detained over at Smithville longer than I expected to be when I wrote you, but I looked up some nice business in consequence. I hope, however, that I have not caused you any inconvenience, and that I am not too late to merit your favors in our line." Which in your opinion Mr. reader will impress Mr. Brown most, the gush of sap, or the businesslike appeal? If you were in Brown's place which would be most likely to get your order?

All these things, as well as many others which I have not been able to mention at this time have their bearing, and as a body of men all having the one aim and ambition in life, it behooves us to relegate to the fathomless depths of oblivion anything, let it be form or formality, trait or practice, which is not conducive to our obtaining best results for the coming year. Let us by one united effort, and by concentrated action of body and mind, lift the industry in which we are engaged to a plane inferior to none other. Let us not forget the fact that, dull as trade may become in all lines, those engaged in handling other lines do not start out on a campaign of giving away their goods. The prices of saws and all supplies remain stable, or higher if they choose, and we must use them just the same. Would not the same rule work out in our case if we but knew how to work it? I aver that it would. We have been easy long enough, and have gone along in a rambling way, knowing that everything we bought was higher, and what we had for sale was lower. One would naturally think that we liked it that way, since the remedy is in our own hands, but we have gone on and on, grabbing after the dollar which we might have known we had no chance of reaching, until now we have, I believe, fully awakened to the realization of our position. We have been acting insanely, and now that we have come to our senses, and have plenty of time to reflect, let us figure out whether it would be better to have nine or ten months of good sound business, or twelve months twice a year of business that has to be kept alive by feeding it upon its own substance.

Over-Development the Main Trouble

The trouble seems to be that we have been trying to force an unnatural growth. It is a case of over-development in our line, with under-development in all other things in the country. We must have use for a thing before it can be either valuable or useful, and that is our trouble to-day. Could we but plant the germ which would grow up and branch out all over the land into great and healthy demand upon our forest products, then our industry would grow without any forcing, but just as long as we try to force our products in double quantities upon an already glutted market, just so long are we wasting our time in trying to nurture a tree and to make it grow a large top in a confined space. It is unnatural, and never will be satisfactory under those conditions.

I do not wish to infer by anything that I have said that we have no capable men in the lumber business in this province for I know that this would not be true, and I have tried to confine myself to facts as I see them. What I do say is, that there are some who are incapable, and partly by their incapability, and partly by other causes we have been led into devious ways, until, at the present time we are all lost, and it will need a Moses to lead us out of the wilderness. It has been a case of the tail wagging the dog for a long time in this industry, and if it is kept up much longer the dog will die. The proper time to start the work of getting out a good balance sheet is on the first day of January, and if that balance sheet is kept in mind the whole year through then there need not be half as much anxiety shown when it is passing through its final stages, as is sometimes the case. If you like a good balance sheet, then do not forget it and allow holes to be torn into it throughout the whole year, for if you do, it will not look well when it is finished. These are plain facts, friends, but they are spoken with a hope of doing good, and not evil.

The Commercial Importance of Birch

Physical Properties and Industrial Uses of the Most Important Canadian Hardwood—
Forming One-Third of Total Lumber Cut

By R. G. Lewis*

CONTRARY to the common belief, maple is not Canada's most important hardwood. It heads the list of hardwood lumber sawn in Ontario but is exceeded by birch in Quebec and the Maritime Provinces. For the whole of Canada birch is the most important hardwood lumber and forms at least a third of the total quantity sawn. Even in Ontario this wood forms over fifteen per cent. of the hardwood produced.

In 1912 Canadian sawmills cut over a hundred million (100,267,000) feet of birch lumber. Canadian railways purchased eight thousand and birch cross ties. Over fourteen thousand cords of birch were distilled to produce wood alcohol, acetic acid, etc. A least five million cords of birch were used for firewood.

It is highly probable that more birch is cut in Canada in a year than any other wood although this would be a difficult statement to prove, as large quantities of this wood are cut and consumed locally and no official statistics are available of its local use. There is no doubt of the truth of the statement that this is our most important hardwood.

There are eight different species of this tree growing in Canada but three of these form the greater part of the wood of commercial value. Many of the species are mere shrubs and others are found only in isolated stands and are rare and unimportant.

The important point in connection with the geographical distribution of these birch species is that, speaking generally they are found further north than any of our other native hardwoods. The Western Peninsula of Ontario was at one time almost a pure forest of hardwoods. Many of these: chestnut, tulip, black gum, walnut, sycamore, black locust, mulberry, sassafras and Kentucky coffee tree, were never abundant and were confined to the north shores of Lakes Ontario and Erie and the valley of the St. Lawrence. These trees formed the northern fringe of the great hardwood forest of the middle West States and would not thrive further north. Other hardwoods, like maple, beech, oak, basswood, hickory, ash, elm, butternut and ironwood, were more abundant and were found in some cases as far north as the Height of Land. The oak, hickory, basswood and butternut have been cut to such an extent that they are now, or soon will be, commercially extinct. Even such trees as maple, elm and ash are being rapidly cut and are not found north of the Height of Land in either Ontario or Quebec. The outlook for a future supply of these woods is very uncertain. Birch is found mixed with all these hardwoods in southern Ontario and in addition to this is fairly abundant further north.

A Vigorous Reproducer

It is a well-known fact that birch is one of the first trees to come in and establish itself on burned and cut-over areas. The seeds are very minute and light in weight and are easily carried by the wind. When they fall on cleared areas and come readily into contact with the mineral soil they germinate quickly and the trees gain a foothold long before the seeds of other species can be carried and deposited on such areas. This augurs well for our future supply of birch in Canada when we consider the enormous areas in this country that have been burned and cut over in the last twenty-five years, and which are unfit for agricultural purposes. When we thoroughly realize that our supply of many such hardwoods as oak, hickory, cherry, walnut, butternut and basswood is strictly limited we begin to see the need of adapting the more plentiful hardwoods to our use. Birch is a wood that is little understood in Canada. It has been discriminated against in the past on account of the difficulties encountered in its seasoning. These difficulties on the whole are the result of ignorance of the physical properties of the wood. If the same care were exercised in seasoning birch as is given to oak, hickory, cherry, and other hardwoods the result would amply warrant the extra expense. Modern mills using improved methods have little difficulty in seasoning this wood.

Sweet Birch (*Betula lenta*), which is also called black and cherry birch, is the most valuable of the birch species. It is more important commercially in the United States than either yellow or black birch and forms the greatest part of the birch lumber on the American market. The tree grows in the Maritime Provinces but is not abundant in that region. The greatest quantities are cut in southern Ontario and in Quebec (where it is called by the French name of *Werisier*). It is nowhere as abundant as the next described species, yellow birch, and does not grow as far north.

This wood is the heaviest and hardest of the birches and is strong

and compact. The grain is fine and the texture fine and even. Wavy and curly effects are common and add greatly to the value of the wood for ornamental purposes. Sweet birch is noted for its peculiar satiny lustre which is due to the light lining of the wood pores. The lumber shrinks considerably in seasoning and is apt to check. The surface takes a high polish and the wood works easily but is very perishable in most situations.

Physical Properties of Sweet Birch

While the physical properties of the lumber cut in Canada have never been studied scientifically up to the present time the figures by Sargent for this wood in the United States can be used for comparing the species. They are as follows:

Weight of dry wood, 47.47 pounds per cubic foot.

Specific gravity 0.7617.

Ash, 0.26 per cent. of the weight of dry wood.

Fuel value, 102 per cent. of that of white oak.

Breaking strength (Modulus of Rupture) 17,000 pounds per square inch.

Factor of stiffness (Modulus of elasticity) 2,042,000 pounds per square inch.

Yellow birch (*Betula lutea*) is cut in Canada in large quantities than any of the other species as this tree has a much wider distribution than sweet birch and is of more commercial value than paper birch. The tree is found throughout the Maritime Provinces and its range in Ontario and Quebec is bounded on the north by a line commencing at Anticosti Island and running north of Lake St. John and Lake Abitibi and following the north shore of Lake Superior to the Lake of the Woods. The tree is fairly abundant everywhere south of this line. The wood of this tree is very similar to that of sweet birch but is lighter in weight and color and lacks some of that wood's satiny lustre. It is nevertheless heavy, hard, and strong and takes a beautiful polish. Sargent gives its physical characteristics as follows:

Weight of dry wood 40.84 pounds per cubic foot.

Specific gravity, 0.6553.

Ash, 0.31 per cent. of the weight of dry wood.

Fuel value 88 per cent. that of white oak.

Breaking strength (Modulus of Rupture) 17,000 pounds per square inch.

Factor of stiffness (Modulus of elasticity) 2,478,000 pounds per square inch.

This would indicate that this wood has a lower specific gravity, a lower fuel value and a greater percentage of ash than sweet birch. Its breaking strength is, however, identical, and its factor of stiffness greater than that of sweet birch so the real differences between the two species are comparatively unimportant. These two woods are generally sold together in Canada. Considerable quantities of birch are imported from the United States and these imports are largely made up of sweet birch but the greater part of the native wood is probably yellow birch. In some cases manufacturers demand sweet or cherry birch but the majority of purchasers do not discriminate between these two species which are sold simply as "hard birch."

Hard birch is used in greatest quantities in Canada by the manufacturers of hardwood flooring. Birch and beech are often sold together and birch, maple and beech together make up over half the hardwood flooring used. Birch goes also into other forms of interior house finish being valued for stair material, panelling, wainscoting, moulding and ceiling.

A Favorite Furniture Wood

Sweet birch is the favorite birch for the manufacture of furniture, cabinet wood and fixtures. The wood can be stained to imitate many more expensive woods, such as mahogany, oak, cherry, and walnut. If this staining is done carefully it takes an expert to distinguish between the real and the imitation. In such cases there is no dishonesty in the imitation if the products are sold as such, because well finished birch furniture is quite as useful and ornamental as that of the more expensive woods. The birch improves with age and being a fine grained wood its surface remains smooth and lustrous when oak becomes roughened and furrowed. In the United States birch furniture is considered quite as valuable as oak. Some of the finest and most beautiful furniture in the world is made in Sweden out of birch of a species similar to our Canadian wood. Oak and mahogany are fashionable at the present time just as walnut and cherry were in vogue a few years ago. When the excellent qualities of birch

*Of the Forestry Branch, Ottawa.

are more fully understood this wood will probably take its place among the finer finishing woods.

At the present time in Canada birch is used for the cheaper grades of furniture only. Large quantities are used for frame work and "inside work" on the more expensive products where the "outside work" is either oak or mahogany. If birch received the same careful treatment and careful finishing it would be quite as popular for outside work.

In the vehicle industry in Ontario birch is taking the place of elm for heavy hub stock as it has been found that this wood will stand the pounding and will hold spokes, and that it has the advantage of being much cheaper and more abundant than elm. Heavy spokes are being made of birch instead of oak and hickory by many Canadian vehicle factories. The wood has been used for other gear stock for some time and is especially valuable for heavy work. For panel and box work both in heavy and light vehicles birch is valuable and is becoming more popular. Automobile manufacturers use this material for dashes, seat frames and door trimmings. In the Maritime Provinces birch is the most important vehicle wood used.

In the construction of cars and coaches birch takes an important part, more as a finishing wood than for framework. It is often finished in imitation of cherry for the interior panelling and finishing of electric cars and second class coaches. The framework and heavy box work of agricultural implements is made of birch in many cases. This industry resembles the vehicle industry in many respects and the wood is used for similar purposes in both.

The manufacturers of handles and brush backs utilize enormous quantities of birch annually as the wood is hard and tough and holds its shape well.

In wood distillation birch is used in Ontario to almost as great an extent as for hardwood flooring but the trees cut are mostly of small size that would not produce saw logs. Slabs and waste from sawmills could be utilized for this purpose to a greater extent than they are at present. The wood for this purpose is not selected for its physical but rather its chemical qualities and all species of birch are used.

Birch is used for slack barrel hoops and occasionally for staves and heading, yellow birch is probably the most important species for this purpose. Boxes and crating of hard birch are manufactured but softer woods are usually preferred for boxes, and tougher woods for crating. Birch is too valuable for other purposes to be used extensively by this industry.

Birch Interiors for Musical Instruments

The manufacturers of musical instruments such as pianos, players and organs use birch for the interior parts including keys, actions, frame work, and inside casework only. The use of this wood for the outside case work, legs and carvings has not been reported although piano manufacturers in the United States have been finishing pianos in sweet or cherry birch for years and value the wood more for its appearance than its strength and rigidity.

Boat builders in Ontario do not favor this wood although they use a few thousand feet in a year. In the Maritime Provinces more birch is used by boat builders than any other hardwood and is used for frame work, planking and inside work. In the manufacture of blocks, sheaves and ship fittings birch is used in greater quantities than any other wood.

Without going into the details of each industry it might be well to add that hard birch is also used by the manufacturers of wooden novelties, woodenware, patterns, laundry accessories, fruit packages, refrigerators, coffins, half tone blocks, picture frames, pumps and sporting goods.

Birch in the form of veneer is used in the furniture and vehicle industries and by piano manufacturers. Built-up chair seats, berry boxes, crates and baskets are made largely of birch in this form. The wood for this purpose is steamed and peeled by a rotary veneer lathe or sliced. It has the advantage of peeling smoothly and of making a very tough veneer.

The Uses of Paper Birch

Paper birch (*Betula papyrifera*) is an inferior wood to the hard birches for most of their uses, but is much more abundant. This tree in Canada ranges south of a line running across the northwest border of the Labrador Peninsula, skirting the shores of Hudson's Bay and running northwest to the Arctic Ocean at the mouth of the Mackenzie River. Very few trees are found farther north than this. The wood is valuable in some cases on account of its whiteness, softness and toughness, in which it exceeds the hard birches. The wood is light, strong, hard, tough, and compact with reddish brown heartwood and nearly white sapwood. The lumber is graded for the quantity of sapwood present. Sargent gives its physical properties as follows:—

Weight of dry wood 37.11 pounds per cubic foot.

Specific gravity 0.5955.

Ash 0.25 per cent. of dry wood.

Fuel value 80 per cent. of white oak.

Breaking strength (Modulus of rupture) 14,900 pounds per square inch.

Factor of stiffness (Modulus of elasticity) 1,841,000 pounds per square inch.

By the figures it is seen that paper birch is lower both in stiffness and breaking strength than the hard birches. The wood is also much more perishable in moist situations.

Probably the most important use to which this wood is put is in the manufacture of small turnery. Spool wood is exported in large quantities from Canada to Europe and the United States and some spools are manufactured in Canada. Birch is valuable for this purpose on account of its compactness. It is fairly hard but does not dull the lathe tools as quickly as other spool woods and when seasoned it holds its shape well. Large quantities of dowels are made from this wood and are used locally and shipped to Europe. Shoe pegs are made either by splitting them out of blocks or by cutting them from birch veneer. Shoe stands (the small flat pieces of wood used to support the arch of a shoe) are made from rotary birch veneer. Toothpicks and skewers and clothes pins are also manufactured of this wood.

Excelsior and wood wool are made largely from poplar in Canada but large quantities of paper birch are also consumed by this industry. The softness of the wood and its long tough fibres fit it particularly for this purpose.

Whenever possible, paper birch is substituted for the hard birches and much of this wood is doubtless cut and sold mixed with the two hard birches although no statistics are available of its production as lumber. It is used for flooring and interior finish and for parts of furniture and vehicle work where great strength is not required.

Other Varieties and Their Uses

Of the numerous other species of birch little need be said as they are nowhere abundant and are cut and sold mixed with the three species described.

White birch (*Betula populifolia*), also called grey and wire birch, is confined to the Maritime Provinces and Eastern Canada, where it is noted for its promptness in taking possession of abandoned fields and burned and cut over areas. The wood is light, soft and weak, but is probably tougher than the other birch species. The wood is used for the less important commodities manufactured from paper birch and is valuable for hockey sticks on account of its toughness.

Blue birch (*Betula coerulea*) seldom reaches commercial size and is similar in its uses to white birch.

Western birch (*Betula occidentalis*) is probably the largest birch tree of America but it grows only in British Columbia and is rare and unimportant even there. The wood is used locally for rough lumber, fencing and fuel and is similar in its qualities to paper birch.

Alaska birch (*Betula Alaskana*) is the most important fuel wood in the Yukon and its range extends south eastward across the Rockies and to the valley of the Mackenzie and Saskatchewan Rivers. The wood may be cut into lumber locally but is not of commercial importance.

Black birch (*Betula fontinalis*) is found in the Rocky Mountain district of British Columbia and Alberta and is of no commercial value except for fuel and fencing. There are only ten birches that reach tree size in America and all of these grow in Canada with the exception of two. Black or river birch (*Betula nigra*) grows in the Eastern States from Massachusetts to Florida. It is sold mixed with other hard birches and may form a part of the birch imported into Canada. It has none of the attractive surface features of sweet birch but is a very strong, serviceable wood.

Kenai birch (*Betula kenaica*) grows on the coast of Alaska and is of no commercial value or importance.

Birch an Important Forest Cover

Apart from the commercial uses of birch in the industries this tree has great economical value as a forest cover. Its seeds are very minute and light in weight. They average about 450,000 or nearly half a million to the pound and are supported on a thin membranaceous wing which greatly facilitates their being carried by the winds. Authentic cases are known where the seeds of this tree have been carried several miles by the wind and have sprouted and established themselves. This probably gave rise to the belief among some old-fashioned woodsmen that this tree reproduces itself spontaneously on burned over lands without the medium of a seed. The seeds ripen on the trees from spring to the middle of summer and are carried by the wind over large areas. If they fall on burned or cut-over areas or on abandoned farm lands they can reach the mineral soil with little difficulty. This enables large numbers of the seeds to sprout and grow into hardy seedlings by the fall of the same year in which they were born on the trees.

Such an early start in the year gives these seedlings a great advantage over most other trees and accounts for the fact that birch

is almost invariably among the first trees to establish themselves on cleared areas. The tree, however, is usually short lived and is soon shaded out by pine and spruce which is established under the protection of the birch and gradually overtops it and kills it for want of light. Few trees cause less inflammable litter than the birch and this tree has been planted to great advantage along railway lines and highways where it acts as a natural fire guard, keeping the ground bare and damp beneath its shade.

Birch is rather a slow growing tree and takes over a hundred years to reach saw log sizes in most localities. Yellow birch in eighty-five years will have an average diameter of eight inches and can be used for handles, spool wood, distillation, pulp, mine props, fuel and fencing. It takes a hundred and eighty years to reach an average diameter of eighteen inches. Paper birch grows more rapidly in its youth but is shorter-lived than yellow birch. It reaches the eight inch diameter in about fifty years.

Wind Felled Much Valuable Timber

Ontario Govt. Report Shows that Storm of Nov. 9th and 10th Caused Widespread Destruction

The Ontario Department of Lands, Forests and Mines has received a number of reports regarding the damage done to Northern Ontario timber by the recent heavy gales and has issued the following report upon the situation:

The wind storm which occurred on the 9th and 10th of November, 1913, appears to have extended in greatest severity from a short distance north and east of Sault Ste. Marie through the country lying north of Lake Huron, and extending as far east as the Township of Merrick on the Temiskaming and Northern Ontario Railway, which is south of Temagami.

On lands under timber license the blow did more or less damage on about thirty-four townships. The timber blown down, if not cut and taken out this winter, would be attacked by the borers next summer and become a total loss. The Department immediately called the attention of the licensees of these townships to the damage, and they are taking steps to save the blown down timber, although it will entail considerable additional expense over ordinary lumbering.

With respect to Crown lands, there has been considerable damage done in the Mississauga Forest Reserve. Here the parties lumbering bought the timber by the thousand feet, paying for it as it is cut. The worst slash that occurred is in this Reserve, and particularly where parties are operating. We have had careful inspections made and are insisting upon the damaged timber being cut this winter, although the operators are claiming that some concessions must be made if they are to take it all out.

Eight Mississauga Limits Suffered

In this Reserve eight limits, equal to four townships, were badly damaged. The Reserve contains a large body of timber and we are having other parts of it examined to see if there has been any damage done there, and we shall have full reports in a short time.

North of Sudbury the damage is not as bad as was first reported, and we have arranged with the contractors for the construction of the Canadian Northern Railway to cut the damaged timber for their work. On the Vermilion River in the Townships of Beulah, Marshay and one or two others, considerable timber is damaged, but this will be arranged for with the railway contractor, who requires considerable timber for construction purposes.

Then, on coming further east, in the Townships of Janes and Dana, north of Lake Nipissing there is a serious blow down of about five and a half million feet board measure of fairly good timber. This blow down was on four lots in the Township of Dana and about fourteen lots in the Township of Janes. There was some standing timber left upon the lots where the blow down took place. The difficulty here was that the timber was very badly slashed down. There were no roads into it, and snow might be expected at any moment. It seemed hopeless to expect any large operator to create an organization, cut roads, etc., for the small quantity of timber there. To call for tenders and give any time to examine would mean it would not be got out this winter.

Timber Sold to George Gordon & Company

Messrs. Geo. Gordon & Company, Limited, were lumbering close to this timber in the Township of Dana, and they made an offer of \$5 per thousand feet board measure for the blown down timber, and \$12.25 per thousand for whatever timber might be standing on the lots where the blown down timber was. This we considered as advantageous an offer as could be got, and the Department determined to take the responsibility of accepting it. The effect will be that this timber will be taken out this winter and will not go to loss.

On the islands in the Georgian Bay, particularly McGregor Island, on which there is considerable timber, the wind did great damage. We have advertised the timber on this Island for sale. There is no difficulty in calling for tenders there, as it is easily accessible.

The same thing has happened on Johns Island, another large island. If any of the other islands have been damaged steps will be taken to sell the timber on them as soon as they can be reached.

There does not seem to have been any damage in the Rainy River or Port Arthur Districts, or north of Lake Superior, nor in the Temagami Forest Reserve or north of there,—so far as the advice from our agents goes. Every effort has been made to get at the extent of the damage and the whereabouts of the blown down timber, and to arrange for cutting it this winter, so that the loss caused by this totally unprecedented catastrophe may be reduced to a minimum.

British Columbia's Progress in Forest Protection

At the meeting of the Western Forestry & Conservation Association held in Vancouver, B.C., on December 15th and 16th an interesting address upon "The Protection of British Columbia's Natural Resources" was delivered by Hon. W. R. Ross. After reviewing the work of the Lands Department of British Columbia, Hon. Mr. Ross dealt in some detail with the work of the Forest Branch. Probably 70 per cent. of British Columbia's two hundred and fifty million acres, he said, was under some kind of timber. Timber was destined to be the greatest crop that could be raised in the province, and since the bulk of the forest land was Crown property and the chief source of public revenue (yielding three million dollars annually) the protection of the forest and the most scientific method of obtaining revenue from it, were two of the most important functions of the government. Eight and one-half million acres of the forest lands had been placed under a license system which called for payment by the operator at the time when the principles of modern forest finance require that it should be paid, namely, when the timber crop was cut and marketed.

He believed that they had in British Columbia an almost ideal method of co-operation between government and private interests, in the form of the forest protection fund and the organization that the fund had rendered possible in the province. During the past year, over one hundred and fifty million acres of the total area of British Columbia had been placed under some form of protection. They had maintained over this area a skeleton organization capable of being recruited to any extent that fire danger might require. Under the excellent weather conditions during 1913 the eleven forest districts had been provided with thirty rangers, and two hundred and eighty guards and patrol men; another one hundred men being at their call at short notice if required. This force had experienced no difficulty in controlling the situation, for, though nearly six hundred fires had been reported, three out of every four had been extinguished without extra cost. Full use had been made of this favorable situation. Numbers of the men had been drafted to improvement work. Fire fighting had cost only \$9,000. Patrol expenses involved another \$190,000. Out of the total fund for the year amounting to \$350,000 they therefore had an ample balance for construction work. The department had thus been able to construct since August, 1913, 1,000 miles of horse trails, 168 miles of foot trail and 360 miles of telephone line, 10 cabins and 10 mountain lookout stations, the cost of these being \$67,000.

Anglo-Newfoundland Company Had a Good Year

The Anglo-Newfoundland Development Company, one of Lord Northcliffe's subsidiary companies, has issued its report for the year ended August 31st last. The company built large pulp and paper mills in Newfoundland for the purpose of supplying the British papers in which Lord Northcliffe is interested.

The mills, when in full operation, are capable of supplying more than the requirements of the papers, but it is stated that no further extension of the company's operations will be made during the continuance of the present Newfoundland tariff. The gross profits of the company, after making provision for depreciation, amounted in the past year to £65,000, which compares with £51,200 in the preceding twelve months, and £34,700 in 1910-11. Debenture interest absorbs £24,800, and a further £10,000 is set aside under the provisions of the trust deed for the redemption of the debenture debt. This leaves a net profit of £30,100, which compares with £9,800 last year, when, however, although there was no charge for debenture redemption, a sum of £16,400 was written off out of revenue to cover the expenses of the issue. The result is to leave the company with a balance in hand, including the sum brought into the accounts, amounting to £45,200, which is carried forward. The directors state that the output from the mills is increasing, while the quality of the paper and pulp produced continues to give satisfaction, which is shown by the fact that the whole of next year's production has already been sold. In 1911-12 the company's profits were earned on an output of barely three-fifths of the capacity of the completed mill, while the company suffered as a result of the shipping and coal mining strikes. The production last year should have been very considerably larger, but while some improvement has been made in the cost of manufacturing paper, this was offset by a further rise in the price of coal and partly also by high freight rates.

The Reader's Viewpoint on Trade Topics

Opinions on Questions of General Interest—An Edger Drive Problem—Waste in the Woods

Articles or letters to the Editor of the Canada Lumberman, dealing with trade conditions, or discussing questions of interest to manufacturers, wholesalers or retailers of lumber are always welcomed by our readers. Here are a few that have been received lately:—

Edger Drive for Hardwoods

Editor Canada Lumberman: Haliburton, Ont., December 16th.

Driving problems are numerous in any sawmill and their solution is always important. In a mill in which I have worked the feed rolls of the edger were driven as shown in Fig. 1. This proved to be too fast a feed for hardwoods, of which there was a considerable quantity in the mill's output. The feed belt was run as slack as possible, consistent with giving service. Still there was much difficulty owing to the saws stopping while edging hardwood.

Finally a shaft was placed across the top of the machine, above the arbor and on one end of this was placed a pulley of the same diameter as the arbor itself. On the other end a pulley of twice this diameter was placed. It was driven from the arbor as shown in Fig.

2, and the feed belt was driven as shown in Fig. 3. A guard was placed in front of the belt running on the arbor so as to prevent stock from striking the belt and breaking it. Of course this had the effect of narrowing the available room for material passing through, but the advantages secured more than offset this.

This device has now been in use for three seasons and has eliminated the difficulty above mentioned.

To support the shaft, wooden caps were placed on top of the frame and babbitt used in the customary way. These cap pieces are held in place by means of U-shaped clamps, as shown in Fig. 4. —James E. McCormack.

Dimension Spruce Firmer at Boston

Editor Canada Lumberman: Boston, Mas., Dec. 19th.

There is not, perhaps, a great deal to be said about a market which has been a slow and dragging one, although it would seem as though, in the last week, trade has been somewhat better, in the vicinity of Boston, probably owing to the long spell of warm weather this fall.

The summer spruce mills—that is, dimension mills that have been

shipping green lumber, are shutting down and there being little or no snow, the winter mills are not starting up yet and temporarily there is a scarcity of spruce, which is reflected somewhat in prices on dimension stock, which are a little higher. This advance is generally felt to be temporary—in fact is quite usual at this time of the year—that is, if the snow is late in coming.

Low grades of southern pine and North Carolina pine have been selling very cheaply in this market, and have been weak. Also shingles have been in slight demand and weak. We understand, however, that there is to be a large shutdown in Washington and to some extent in British Columbia and the production of these shingles will probably be greatly reduced for a time.—Shepard & Morse Lumber Company.

Two Sources of Waste in the Woods

Editor Canada Lumberman: Ottawa, Ont., Dec. 17th.

I have been trying to think what the real sources of waste are in lumbering operations, and I can think of but two. The first I do not think will be understood by any but a practical lumberman, and that is the cutting up of the trees into logs after they are chopped or cut down. In too many instances the logs are measured off 16 ft. and 13 ft. regardless of quality, whereas a great saving could be made by carefully separating the good from the bad, and making as many good logs out of the trees as possible, then taking the best you can out of the coarse or cull material which is left. This I consider one great source of waste in woods operations.

Now there is one more serious waste and it is the only one I know of, namely, that under the Crown Lands regulations as they exist today, the lumbermen are forced to take out small, crooked and very coarse tops which do not pay the expense of handling, and here there is an enormous waste. Years ago, it is true, the reverse was the case and comparatively good logs were left in the woods to rot, but I am not aware of any lumbering operations where this is the case today, but the other extreme is gone to and a great waste, both to the individual lumberman and to the country exists, consequent upon taking out many logs that do not pay the expense of taking out and sawing.—W. C. Edwards.

The Fraser Bryson Lumber Company, Limited, Ottawa, Ont., have selected an exceptionally attractive calendar as a souvenir to send to their friends at the new year. One of Philip R. Goodwin's splendid paintings of backwoods scenes is used to decorate the calendar. The title of the picture is "In Strange Waters," and it represents a couple of canoeists shooting rapids at the headwaters of the Ottawa. The picture is very realistic and at the same time an exceptionally fine work of art. It will appeal forcibly to all who have had anything to do with logging operations or cruising in Ontario's Northland.

What Constitutes "Absolute Accuracy" in Cruising

Editor Canada Lumberman: Montreal, P.Q., Dec. 16th.

Our friend, Mr. Sewall, seems considerably peeved at my statements. While I have no desire to enter into anything but a friendly discussion of this topic, I may just briefly state however that by "absolute accuracy" in timber limit estimates of areas (such as we have them in Canada) comprising anywhere from one hundred to one or two thousand square miles, we must perforce be practical and mean just so accurate as it is possible to be in such work, and by our method we claim that when we state a certain area contains say one million cords of pulp wood, it will be found to be so nearly that amount that for all practical purposes it will be "absolutely accurate." Now, surely anyone with common sense can understand that. What would be the use of paying say \$30,000 extra for a forest survey in order to determine whether there is an error in value equivalent to or less than the amount expended in trying to discover it, especially when in lumbering operations a wide margin of waste is overlooked. Opinions may differ but I would certainly not encumber my work by the use of calipers. May I ask Mr. Sewall how he measures the height of trees? Would he use step-ladders and a steel tape, or would he just estimate? If he estimates the height of a tree, why shouldn't he estimate its diameter, which he must concede is more simple than estimating the height.

Such methods as suggested by Mr. Sewall in timber cruising and forest surveys have no practical application here and while they have been observed in one or two isolated cases, I may be pardoned if I state that they caused considerable amusement to a great many.—R. O. Sweezey.

Logging Superintendents' Convention

Interesting Practical Addresses and Discussion of Working Problems at Meeting
Held at Green Bay, Wis.—Machinery, Methods and Equipment

The first meeting of Northern Logging Superintendents, held under the auspices of the Northern Hemlock and Hardwood Manufacturers' Association took place at Green Bay, Wis., on December 6th.

Mr. E. A. Hamar, president of the association occupied the chair and about 70 members were present representing more than 40 different concerns. In opening the meeting Mr. Hamar referred to the history of logging in the north, discussing the great changes which have taken place during the last twenty years. Logging, he said, which was in reality the most important part of the lumber business, was probably the least understood, on account of the primitive conditions under which they formerly operated, when timber was delivered to lakes and streams on short hauls and floated down to the mill. A second reason for the logging business being the least understood in connection with lumbering, was the remoteness of logging operations from headquarters. During the earlier days of the logging business, the most difficult problem for the lumbermen to solve was the flooding of the logs from the remoter territory to the sawmill. Some of the engineering feats of the pioneer lumberman in building dams and reservoirs for flooding logs down the narrow and rocky streams had been little short of wonderful. He had seen streams which had carried millions of feet of logs year after year, down which a novice would think it impossible to float a canoe.

During this period labor, except for river driving, was cheap. The same crew of men that went into the woods in the fall usually stayed until spring, so that the foreman was not confronted with the problem of constantly breaking in new men, which in itself under present conditions was a rather serious and expensive problem. Supplies were very much cheaper than at present, and as the food served was much plainer and not of so great a variety, the cost of feeding men was much less. He had figures in his possession, compiled for a set of camps for the years 1892 and 1893, showing an average cost of 23c. per day per man for food. It was now costing the average lumberman double this amount.

The conditions of this earlier period were gone, in his opinion for ever, and they must now face new ones. Logging, as carried on to-day was a very complicated undertaking. The woods superintendent had under his charge a large investment in horses, machinery and railroads, including the necessary rolling stock. In order to get the best results each division of the logging department must be nicely adjusted to the others, so as to balance and involve no delay in supplying a mill with logs. The two most serious problems confronting them to-day were the constantly increasing cost of labor and of food for the men. He believed that camp cooks would have to be taught to change their methods of cooking and supplying their tables.

The higher cost of labor and supplies had come to stay for some time. They would probably not see for a great many years the low schedules that prevailed some years ago. The only way to reduce the cost of labor would be to increase its efficiency and to do this, with the low grade of labor now available would be a very difficult matter. One of the best methods was the preparation of daily cost sheets for each camp. These however, were not practicable except where a camp was logging direct from the stump to the mill. Another useful method was one that could be applied to camps cutting and skidding and which consisted of requiring each gang of sawyers and each skidding crew to turn in the number of logs sawed or skidded daily. With this count before him each night, the foreman could tell pretty nearly whether his men were giving him a fair day's work.

Every camp employing eight or more saw gangs should have a saw boss. The saw boss would not only increase the amount of the daily cut, he would save timber, by preventing wasteful cutting. In any lot of logs cut and lying in the woods to-day, ready for the skidders, where there was no saw boss, you could find 14 to 16-foot shakey butt hemlock logs that should have been long butted or cut 20-foot so that when the shake was cut off in the mill there would still be 16-foot lumber instead of short stuff. You could find hardwood cut 16-foot long where an 18-foot log would have saved 2 feet and cleaned up the tree to the crotch. You could even find 4 feet wasted where two 10-foot logs would have cleaned up the tree.

Every camp with eight or more teams of horses should have a barn boss. A good man in this position, by careful methods of feeding would save his wages in feed and the horses would be kept in better condition and sickness avoided.

The Steam Log Hauler

An interesting address was delivered by Mr. Geo. N. Harder, of

Rib Lake, Wis., general manager of the Rib Lake Lumber Company, upon the use of the steam log hauler. His company use a Phoenix log hauler, manufactured by the Phoenix Manufacturing Company, Eau Claire, Wis. They estimate that the engine is good for forty miles per day. Under load it would make four to five miles per hour and when returning light its speed was five to six miles per hour. They had never used the machine to its full capacity. Their maximum load per trip was fifteen loads of logs, approximately 80,000 feet and three loads of bark or about thirty cords, making a train of eighteen loads. Their maximum haul for one day had been 150,000 feet of logs and fifty cords of bark on a seven-mile haul. During the present winter the machine will be making three trips daily between one of the camps and the mill, a distance of seven miles. They estimate that it will be taking the place of nine single teams and teamsters. It is manned by three men, an engineer, a fireman and a pilot. Horses are used in bringing the loaded sleds from the skidways in the woods to the spotting ground, where they are assembled and made up into a train. During the winter of 1911 and 1912 the company operated a log hauler on a six-mile haul, which cost 16c. a thousand, including wages of the crew, fuel, oil, repairs, etc.

At the conclusion of Mr. Harder's address a number of superintendents gave their experiences with steam log haulers.

Running a Logging Camp

An address prepared by Mr. E. S. Hammond of the Hammond-Chandler Lumber Company, Rice Lake, Wis., was read by Mr. R. S. Kellogg, secretary of the association, in the writer's absence. The address dealt with a number of interesting phases of woods operations and was in part as follows:—

An agreement should be made before the cook goes into woods and a copy forwarded to the foreman. This agreement should state explicitly the services he is required to render, about how many men he is supposed to handle, how much help he is to have and what he has represented himself to be. This gives the foreman an idea of the situation so that no misunderstanding will arise. He will represent himself to be excellent, a good cook and capable of handling a certain number of men, but when he gets to the woods he is generally a different breed of dog altogether. If the foreman is expected to check the cook this will prove a failure in most cases as this part belongs to the man in authority in conjunction with the foreman.

In the past our cooks have always been in the habit of serving two, three or four kinds of meat, as they deemed best to satisfy the crew. We have started in this fall with strict instructions in writing that only one kind of meat be put on the table at one time. They will often try to overcome this with the excuse that they had some left over. For your information, I wish to say, there is always something left over. One of the most wasteful items we have to go up against is too much food being cooked ahead. It gets old, mussy and sour, unfit to eat and is thrown away. Sometimes they have hash, stew and roast at the same time. This should be strictly forbidden. Of course some leniency and allowances should be made the cook, but the idea is practically to hold to one kind of meat on the table at same time.

Pudding, Cakes, Pie and Sauce

I feed the men all the cake, pie, pudding and fruit for sauce they can eat. I put two kinds of sauce on if necessary for the reason that I believe in filling them up on anything they will eat outside of meat. Pies, cakes, pudding and fruit sauces are not usually thrown in the slop pail and if too much is cooked ahead, it will generally be cleaned up. Some people advance the idea that men are not able to perform the same amount of labor on sugar products as on meat and potatoes. I don't know but that one gets just as much labor out of the men under such conditions as he does by confining them to pork, beans, beef and potatoes. Too heavy food is just as bad as too much pie and cake. We give them ginger snaps, sweet, graham and soda crackers.

Recently we purchased one hundred pounds of strained honey at 9½ cents per pound. I believe this will be used on bread, biscuit and pancakes and be good healthy food.

All canned and package goods should be standard. Some people seem to think you can put any old thing on the table for lumberjacks, but we believe everything you serve in camp should be standard stuff. It should be new stock, as it goes along way toward preserving the health of the men and we find they like it. We give them canned tomatoes, peaches, apricots, apples, grated pineapple, etc. We do not furnish any extracts but let them use the grated pineapple to season puddings, cakes, rice, etc. They seem to like the prepared

breakfast foods and use condensed milk with it reduced 8 to 1 with lukewarm water. Don't use cold water.

"I find that sardines, dried fish, salmon, rice and cheese go very well. Cheese can be used in conjunction with macaroni. If the cook adapts himself to getting up these little side dishes, they are very acceptable and enjoyed by the men. A good book can be furnished to each cook.

Cleanliness and Management

It is a universal custom to feed men well in the woods and the principal point in feeding is to have a good clean cook. Give him good tools to work with, good stove and camps, then see that he makes good and keeps everything clean. As I said before, don't depend too much on the foreman to line up the cook. The woods superintendent should attend to this. Don't wait for men to utter kicks but do the fault-finding yourself. If one cook can't make good, give him his time and find someone who can. Cooks sometimes start in well but get lazy, dirty and wasteful and cranky. Don't put up with a cranky cook. Make it a practice to go into the cook camp every day and stand around a few moments to get acquainted. Your presence on the job is something. Keep him line up today, tomorrow and the next day. That is, by careful management, and always use due courtesy. They are usually human beings and like human treatment. The idea is to show you are interested. If the cook gets angry, as he sometimes does, try to reason with him, but if there is no reason in him, hire another as soon as possible and let him go. If he is going to quit on the spot, don't pay him a cent but sue for damages. However, be sure to make damages large enough. It don't do to let any cook run the bluff on your pocketbook and you. In the logging business you will find that one year you have trouble with cooks, next year cooks will be all right and loaders will go wrong. Next, loaders will give good satisfaction but you will have trouble with teamsters and next year you will have a lot of trouble with the foreman. In other words, in employment of labor, there is always trouble and it is up to the superintendent or employer to stand behind and with the foreman.

We hire men under two wages and issue slip (copy of agreement) to the employee. A carbon copy of the agreement is kept in the hiring book. Whatever understanding we have in regard to wages and the services he is to render is written on this slip. The law is such that you are compelled to pay an employee what you hire him for, provided he works at the job you hire him to do. Any change of jobs makes change of wages, provided the employer so wishes. If a man is hired at \$26 per month to swamp and he is put to top loading he can collect wages as a top loader; or if he is hired at \$40 per month to top load, and he is unable to perform the work, you can put him at swamping and he can collect only wages that you are paying for such work. Again, if you hire a man by the month under the law you are compelled to give him employment for a month and he is compelled to work a month, provided he does as he agrees. If you fail to give him employment for that length of time, he can sue for the full month and collect. If he fails to work a full month, you can refuse to pay him for services performed and sue him for damages for nonfulfillment of agreement. In hiring under two wages, we find there is a good chance to pay a poor man off at low wages. Again, the question must be distinctly kept in mind of paying a man full value for his hire. If you pay a good man good wages, he will always like to come back and work for you. It does not look well or work out well to pay the same wages to all kinds of laborers; that is, to pay the poor employee the same as you pay to a good one. Treat the men on the square when they treat you on the square and be the first to give this good treatment. If they try to give poor service, come back with poor pay and a law suit if necessary.

Settlements

Right here comes in the question of who is going to settle with these men and who is going to make wages with them when judgment day arrives. The superintendent will have to attend to some of this. Unless the foreman has a very strong back, he will break down if he attempts to do it all. You might say it is impossible for the superintendent to be on the job all the time. I will admit this to be a fact but he can arrange his office and other things in connection, so that he can assist somewhat and if it comes to a showdown, the greater part should be assumed by the woods superintendent when it comes to settling the wage question, in conjunction with timekeeper and office force.

We aim to send money to wives and families of married men just as fast as it is earned if they so desire, but try to size up the young fellows. If they are in the habit of coming in to the office and asking for \$2 to \$5 as fast as it is earned, we head them off on the start by asking, "What do you want to do with it?" If they can not give good explanation we refuse to give them money. If they don't like it and quit, we give them what they have coming.

Advancing fares is another very important question. Stop this advancing fares for employment agencies and labor. If men have not

money to pay their own fares, you will find they will take the blind baggage or tie pass and in the end, they will be very careful to save a little money to get them out where the job is. The idea of lumbermen advancing \$500 in fares and not receiving over \$100 back is a foolish proposition. In the spring you will have a nice big warehouse full of old dirty baggage. Employment agencies hold up before your eyes the fact that the other fellow is advancing fares and if you want any men, you will have to do the same. This is all nonsense. There are only so many men to go around and if one camp gets filled up there will be enough for the other fellow, or if there are not enough to go around by doing business this way, there would not be enough by doing business the other way. It is a matter of seeking its own level. If we expect to do our logging in future by advancing fares through employment agencies, we may as well make up our minds that it will cost \$1 per thousand extra to log.

This men-getting business is a trade by itself. If the lumbermen would spend \$1,000 in advertising it would pay 500 per cent. on the investment. Extend your advertising east, west and south.

Size of Camps

Build your camp to hold about 30 to 50 per cent. more men than required, for the reason that usually during the months of November, December and January, or about 2 ½ months, there are plenty of men to be had at \$26 to \$30 for common labor. Hire everyone that comes along, fill camps full, buy extra tools, lay out all your work ahead, cut roads, grade them, cut out skidways and landing. If you hire teams build barn for twice teams necessary. The idea is to log as fast as possible for about three months. After February 1 to 15, men and teams will quit. If you have taken all these precautions your work will be well ahead.

On the other hand, if you construct small camps and small barns, you are always behind with your work, short of men and teams and always hunting after these things, offering higher wages to get them than you would have to otherwise.

Logging is like war, especially if you are a logger. The idea is you have to get logs on the landing or "bust." No man wants to "bust," or make a failure of his business. In logging, you must always go ahead and keep going. Treat everybody right if he will let you. If he will not, you are not to blame.

Now comes the question of the superintendent. Is he big enough for the position? I am afraid he is not. If he is not capable of filling this position, it means expensive logging. It is much harder to obtain a good logging superintendent than it is to obtain a good man to run your sawmill. I believe that if the superintendent were financially interested in the company, it would be better for the company. He should have the brains and diplomacy of a United States president and the fighting qualities of a John L. Sullivan.

During the discussion upon this address Mr. Lamont Rowlands, of Chicago, of the Goodyear Lumber Company, Tomah, Wash., submitted the following statement of the cost of food at one of that company's camps for one year, based on about one hundred and fifty men:

Material Consumed	Amount	Cost per Man per day
Beef, fresh	400,670	\$.0872
Beef, corn	102,727	.0223
Bacon	114,702	.0249
Salt pork	62,359	.0135
Sausage	24,994	.0054
Lard	115,005	.0250
Butterine	55,319	.0120
Flour	131,948	.0287
Potatoes	87,062	.0189
Brown sugar	50,843	.0110
Granulated sugar	96,309	.0209
Coffee	57,083	.0124
Tea	21,373	.0046
Beans	42,908	.0093
Tomatoes	34,175	.0074
Peaches	24,346	.0053
Miscellaneous, of small proportions.	240,613	.0523
Total	1,662,436	.3611

An address was delivered at the afternoon session by W. E. Hallenbeck, of Wausaukee, Wis., of the J. W. Wells Lumber Company, dealing with "Steam Ground Skidding." Mr. Hallenbeck said that he believed the time had come when they should, so far as possible, get away from the old methods of horse logging. After leaving the pine limits which had been cut out in the earlier days of logging and going after the hardwood, they found themselves confronted by several obstacles which had not been reckoned with. First, instead of fairly level sandy soil, where railroad building was comparatively easy, they had now to open a rough, hilly, stony country which yielded hardly one-third the number of saw logs that the pine lands yielded. It was very difficult and far more expensive to get in a rail-

road. Here and there they would find deep pot holes and ravines out of which horses could not draw the heavy hardwood logs. Thus, when these difficulties were developing, the old-time lumberjack commenced to forsake the northern camps, going either south or west. The steam loader had helped greatly, but still the problem remained of getting in the logs. The advent of the skidding machines had then come to their assistance. He was strongly of the opinion that steam skidders were only in their infancy, but had come to stay. What they wanted was more and better machines. There were practically only two types on the market today, the ground skidder and the overhead cable way. It was his opinion that the cable way was the coming machine.

His own experience was based on the use of the ground skidder, of which they use the one known as the Lidgerwood. With railroads laid out 1,200 feet to accommodate horse skidding, an enormous amount of work was entailed in getting in the tracks, as well as the employment of large crews of laborers which were very hard to get. As near as they could estimate, the grading of such branches cutting and clearing right of way, laying steel and surfacing included, cost about \$1,500 per mile. Figuring this mile of track with a skidding width of 1,200 feet per team gang, would give 145 or 150 acres, containing approximately 1,500,000 feet of logs. Thus the railroad cost about \$1 per thousand feet.

With the skidder they went out twice the distance for logs; therefore eliminating half the cost of the railroad. They covered 300 acres to the mile of track, harvesting about 3,000,000 feet of logs. A machine costs a lot of money, but so did horses. The cost of the quantity of cable used would probably balance the hay and oats. Skilled labor was necessary to run the skidder, but better results were obtained and the men probably stuck to their jobs if they were paid good wages. All in all, he was strongly in favor of the steam skidder. In building their railroads, his company now used a railroad ditcher, which with a crew of five men and a team would build one mile of grade in heavy soil, with a great many boulders, average cuts and fills, 14-foot crown to allow the steam skidder to go through cuts, including pulling of stumps and casting them out, at the very small expense of \$425 per mile. They had thus reduced their grading cost by two-thirds.

Logging With Horses

The next address, by Mr. J. W. Gleason, of Goodman, Wis., of the Goodman Lumber Company, was entitled "Logging with Horses," and was one of the most interesting addresses presented at the meeting. Mr. Gleason spoke as follows:—

To the modern logging operation in Wisconsin, Michigan and Eastern Canada "the horse" is an absolute necessity. Good machinery is very important but more important still is a good force of able-bodied horses. Efficiency is the greatest requirement—a term which applies to every branch of the logging game.

My experience has been that too little attention is given the care and handling of horses in the lumber woods. In the "Old Pine Days," or before modern methods were known, horses were worked during the winter months and turned out to pasture all summer to recuperate. Everyone had the idea that they could not do any logging unless they half killed their horses. A man was not considered a teamster unless he could make a team eat three bushels of oats every day and could pound them on the head for 18 to 20 hours every day. There are more horses ruined by over-feeding than by any other cause. The average teamster of today, in that respect, is like the newly married young lady, who—upon entering the meat market was asked: "How much steak do you want?" She replied: "I don't know whether I want a pound or a whole cow." The teamster does not know whether a horse needs a quart of oats for supper or a whole bag full. To get the best results, horses should be kept in good condition. Their teeth should be gone over at least once a year by a competent veterinary. We keep a man at each camp whose sole work is to look after the horses—he feeds them three times a day; keeps the barns in good sanitary condition; looks after the harness—in fact everything in connection with the horses, and he gets to know every horse. He is the only one around the barns who has access to the oat bin and the harness room. We find that by having one man in charge, who has gained his knowledge by actual experience, we get better results. It eliminates, to a certain extent at least, acute diseases—such as spinal trouble, cholera, etc., etc., which is common among horses. We buy the best oats and hay; feed bran once a week (Saturday night) and we do not feed any stock foods of any kind whatever. We work our horses all the year round—or an average of 300 days of ten hours each. I will give some facts and figures to show what horses can accomplish if properly cared for and handled. The figures will relate to the year between November 1st, 1912, and November 1st, 1913.

What Well Kept Horses Can Accomplish

We operate two camps having twenty-four teams in the logging service—or twelve teams in each camp. One team is used for hauling water to the horses and lunch to the men. One team is used for railroad work exclusively. This leaves ten teams in each camp to do

the skidding. They do not do any loading as we operate two McGiffert loaders. The following includes the two camps or twenty teams skidding 312 days—or 6,240 days for one team: Logs, Doyle scale, number of pieces 228,349, 13,948,550 feet, which tallied over the trimmer board measure 21,090,562 feet; 12,578 cords of 4-ft. chemical wood (birch and maple); 1,754 cedar telegraph poles and 8,569 cedar posts.

I will give you the different items of horse feed, etc., and what they cost—in other words, what it costs us for horse flesh and the amount of work they do. We value the teams at \$600 each or \$14,400. One thing we have learned by experience is—that the average life of a horse, in the lumber woods, when they are worked the year round, is from four to six years and one thing they do claim is, that to keep a man driving a team that is broken down is a waste of human energy, which is the most expensive commodity that is used today in every successful operation. Human energy and brains go hand in hand. No lumbering operation is successful without both.

Depreciation, interest, etc., 25 per cent.	\$3,600.00
Oats consumed, 11,395 bushels	4,899.37
Hay consumed, 196 tons	2,828.70
Bran consumed, 12 tons	218.30
Veterinary services and medicine	221.00

\$11,767.37

A Practical Camp Accounting System

These figures are absolutely correct—for I made them myself. Our company has the best accounting system under the sun. They do not use the old debit and credit system. They just charge everything and credit nothing. We have a little accounting system of our own in connection with the woods department. Supplies purchased, supplies on hand, inventory every month, distribution of labor, material, etc., etc. We don't wait until the 15th or 20th of the following month to see "where we are at," for about that time the general manager calls a fellow in "on the carpet" and shows him a little slip of paper containing some figures, then he straightens up in his chair and says: "John—(Tom, Dick or Harry, as the case may be) it is costing too much to log; too much to build the railroad; too much to feed the men—and this, that and the other thing is costing too much—and nine cases out of ten a fellow has to sit there like a bump on a log, not knowing what to say. So the only way is to keep an accurate tab on everything as you go along and when you find that anything is costing too much—"cut it out," before the "Boss" gets "next to it."

The average cost of logging per thousand feet from November 1st, 1912, to November 1st, 1913, Doyle scale, was as follows:—

Sawing	\$1.10
Swamping75
Skidding	1.28
Loading30
Tools and repairs25
Depreciation, horses, equipment, etc.90
Roads and spurs	1.00
Supervision, overhead25

\$5.83

The average cost according to the general books was for ten months, everything included for the twelve month, Doyle scale, was \$5.94. The difference between Doyle scale and lumber tally was 44 per cent., so that the net cost for the ten months was \$4.13, lumber tally over the trimmer.

Mr. Geo. H. Holt, of Chicago, president of the Holt Lumber Company, Oconto, Wis., delivered an address upon "Standardization of Accounting." It was high time, he said, that lumbermen should systematize this important branch of their operations and it was now an opportune time, because labor was more plentiful, costs of operation were excessive and business prospects were bad. Individual companies here and there might have systematized their operations properly, but most operations were conducted in a very crude manner, so far as the accounting was concerned. The trouble with most accounting systems was that the important information could only be secured when it was too late, after the horse had been stolen. Even then it was not in such shape that it could be utilized and applied in subsequent operations. Most of the knowledge was in the heads of individuals who had had the experience, and it could not be utilized by others.

Wages meant nothing as a test, or guide to efficiency without a record of the product. The total cost of logging was of little value unless one knew in which department there had been efficiency or inefficiency. There must be a just balance between the cost of ascertaining these facts and their value when ascertained.

The logging camp was a most deplorable example of waste material and labor, coupled with the crippling of the energy which it was designed to produce and maintain.

There was greater need for the State to prescribe the quantity and variety of food to be served in order to conserve the health and

lives of camp employees, than for the State to protect employees from possible injury from operating machinery.

Lumber organizations might profitably unite in employing some skillful person or organization to train camp cooks and to establish standards of rations for every meal and for every day in the week which would give variety and maintain comfort and strength of the men.

Standardization of forms for use in organizing and conducting logging operations, the purchase of supplies, equipment and apparatus, keeping track of the condition, location and quantities, checking waste, loss or theft, and fixing the responsibility for these things upon someone who could be called to account for them, were indispensable of efficiency. It was foolish to buy supplies and material without a test of quality. The waste resulting from neglect of this fact was a tremendous element in the cost of operation.

An important discussion then took place upon welfare work among woods employees and a motion was passed to appoint two committees, one to investigate welfare work and another to investigate questions relating to the standardization of accounting methods.

A census was taken to discover the wages paid for the different classes of woods workers. It was shown that the wages were fairly uniform, running from \$26 to \$40 per month and board. Most of the companies found their chief difficulty to be securing good men and all were disposed to pay good men all they were worth. Swampers were commonly paid \$26 to \$28; loaders, \$36 to \$40; teamsters, \$30 to \$35 and sawyers \$26 to \$32. A few were paying teamsters \$40, but these were extra good men who had been long in the service.

Quebec Forest Fire Report

The annual report of the Minister of Lands and Forests of the province of Quebec for the year ending June 30th, 1913, contains an interesting report by Mr. W. C. J. Hall, superintendent of the Forest Protection Branch. After the disappearance of the snow in the spring of 1913 at the end of May, and the beginning of June, Mr. Hall reports, conditions became very dangerous as the rainfall was light, and so menacing that I found it necessary to have the whole staff out in the field working over time, warning the people, and in every way possible endeavoring to prevent fire. Our efforts were fairly well rewarded.

One of the worst fires we had, was that which started on a settler's lot near Ste. Rose. It ran over about five or six other lots, and eventually communicated with railway property on the Q. C. R., there consuming about 8000 cords of pulp wood, several buildings, some lumber, etc. I consider the total loss in this fire reached the sum of \$75,000, inclusive of mature and younger forest growth.

The St. Maurice River basin experienced a veritable drought this spring, and it was only by supreme exertion on the part of the Protective Association that we were saved from serious conflagrations. I cannot speak too highly of the strenuous efforts made by Mr. Sorgius and his staff to ward off the danger, and must congratulate them warmly on the results achieved. General rain in this section only came about 15th to 20th June, whereas in other districts it arrived earlier.

Thus, taking into consideration the dangers which threatened us generally through the Province, and the comparatively small losses sustained, although the list of fires is large, I consider results to be eminently satisfactory. The staff has demonstrated its ability to cope with serious conditions successfully; we had an easy task, it is true in 1912, but quite the reverse in 1913, and were found equal to the occasion.

Railways Reducing the Risk

It is with much satisfaction that I can report great strides made in the way of better conditions this year on railways. In 1912, the Board of Railway Commissioners of Canada assumed control of forest protective work on all railways in the Province, except the I. C. R., and N. T. R., plus the provincially chartered roads, and issued order No. 16570, which detailed the plan of operation for protecting forests adjoining these railways. The Quebec Public Utilities Commission then took up the same line of conduct, as regards railways with Provincial charters and issued order No. 72, almost a duplicate of No. 16570.

The Quebec Public Utilities Commission saw fit to appoint me Provincial Fire Inspector early in 1913, with full powers to carry out order No. 72. The Board of Railway Commissioners also appointed me in the same capacity for railways under its control.

I had numerous conferences at Montreal and Ottawa with Mr. C. Leavitt, Chief Fire Inspector, and together we held conferences with all the railways, invariably meeting with hearty co-operation. My inspectors examined all the railways in the Province and located the dangerous sections, and special patrols were ordered on all these, after conferences held with the various roads interested.

The organization was completed in time for the season of danger, viz.: the disappearance of the snow, and my inspectors were in the field in time to cope with the situation. The Board of Railway Commis-

sioners kindly supplies passes to the staff, and assists us in every possible manner.

Thus, for the first time in the history of the Province, a regular system of protection has been established along lines of railways. The results from this first effort have been that, owing to the efficiency of the new organization, I have no serious fires to report as originating from railway lines controlled as above. Part of this successful result must be attributed to the excellent locomotive inspection carried on by the Board of Railway Commissioners, and which by special arrangement includes locomotives on all provincially chartered roads, except one or two which are remote and which happen to run through cultivated lands where there is no danger of fire occurring. Difficulties were met with e.g. proprietors of timbered lands, adjoining the rights of way, have been cutting, and the inevitable dangerous collection of debris and slash remains in some places. The Government has no authority to compel these owners to clean up the debris. It is unfair to the railways, they cannot enter on these lands and perform the necessary work. The Government wrote to a number of these people asking them to clean up; a very few complied with the request (all honor to them), others evaded the point, others completely ignored the correspondence of the Government, a fact which I desire to emphasize. Such being the case, I now beg to request the Honorable Minister to cause legislation to be enacted at the coming session which will enable the Government to compel owners of timbered lands adjoining railways to clean up their forest debris for a depth of 300 feet along their frontage. Railways are now compelled to maintain their rights of way free from debris, and are liable in damages for fire starting within 300 feet of the track; it is unfair to subject them to such conditions when owners of lands create veritable fire-traps right beside them. I urge this reform strongly.

The order in council imposing a \$5.00 penalty per square mile for non-patrolment of limits has had a good effect, and we have as a result many more rangers, and a very much increased safeguarding of the forests. Nevertheless, incredible as it may appear, there are still some limit-holders who are so careless of their interest as to decide that they will take the fire risk and pay the penalty. It was hard to convince some that the government was serious in this measure, but the majority acknowledge the necessity therefor, and made proper provision. In this connection I may say that the Province of Quebec Limit-holders Association rendered us signal service by strongly advising its members to comply with the requirements of the order-in-council.

The Value of Joint Protective Measures

I made mention of the St. Maurice Forest Protective Association, in my last report, eulogizing the system and principles of co-operative protection and complimented the Association on the work they had done. I also expressed the hope that limit-holders in other sections of the Province would follow the excellent example set and form other associations. I regret to say that now nearly a year has passed by and not another such association has been formed. What are our limit-holders thinking about? A joint drive on a large river is admitted to be more efficient and less costly than individual private organizations, the same thing applies to forest protection, the results are to be seen in the St. Maurice Valley. There is ample room for four or five such associations in this Province; for example, one is needed to cover the Gaspé Peninsula; another from the Matapédia Valley to the county of Bellechasse, on the South Shore, a third comprising the Saguenay and Gulf region, and at least two could be formed to comprise the Upper Ottawa District. Co-operative protection is just as feasible as co-operative driving of logs. The efficiency and thoroughness of co-operative protection being demonstrated, it is difficult to understand why further progress along these lines has not been made. The matter has been thoroughly gone into by the executive of the limit-holders association and strongly recommended by it. I hope sincerely that in a short time we will be able to report a different state of affairs and to point with pride to several organizations of this kind in our Province.

Judging by the reports received, I conclude that the ravages of the spruce bud-worm are decreasing, as professor Hewitt predicted. However, the forest tent-caterpillar has been very prominent; this pest has stripped the foliage from the deciduous growth, particularly on the South Shore, but he apparently has also firmly implanted himself north of the St. Lawrence as well.

The lookouts on the limits of John Fenderson & Company, and the Charlemagne and L. O. Lumber Company, operated satisfactorily; the James MacLaren Company has installed a telephone service far up the River du Lièvre, which is a marked improvement, and advance; the River Ouelle Pulp Company operated their telephone system on their limits with the usual success. The St. Maurice Forest Protective Association, is arranging for six or seven lookouts, to be ready for next year.

The Pearl City Veneer Company, Jamestown, N.Y., report that they are finding business very good, considering the customary quietness at this time of year.

Retail Methods Contest Date Extended to Feb. 1st

Read the Particulars Below and Try for a Prize

Competition for Retailers

The date for receiving letters in the retail methods contest has been extended to February 1st, as the holiday season has prevented many, who would like to compete, from doing so. You now have four weeks more. A number of good letters have already been received.

Retail Lumbermen have plenty of yard and office troubles. Everyone has his own way of handling difficulties. Send us a letter about one of your own problems and the way you handle it. We are offering prizes for the best letters.

Fifteen dollars for the best.

Ten dollars for the next best.

Five dollars for the third best.

If you do not come among the first three, you may be among the next five, to each of whom we will give a year's subscription to the Canada Lumberman. If already a subscriber, you will be given credit for another year.

It won't be any trouble to write and you may get one of the prizes.

Others will benefit from your idea; you will get the benefit from all the ideas of all the others.

Any yard or office problem will do. Make your own choice and write soon. The contest will close on February 1st and the prize winners will be announced as soon as possible after that date.

If drawings are necessary to illustrate your idea, they may be included, or a rough sketch may be sent, from which we will prepare an illustration. Make the sketch plain and our artist will carry out your ideas.

Three experienced retail yard men will be the judges.

The contributions will be numbered in the order received and the names withheld until the judges have given their decision.

The Scientific Kiln Drying of Lumber

Before wood is suitable for use for most purposes it must be dried. Dry wood is in a unique condition, since wood in the living tree has never been dry from the time it was first formed. The operation of removing the moisture from wood does not consist of simply evaporating moisture. If evaporating moisture were all there were to the process, there would be no problem at all; it would simply be an engineering feat of supplying the necessary latent heat. Wood, however, is a complex substance and the removal of the moisture is accompanied by physical and mechanical changes. It shrinks and increases in strength and other changes take place.

It is a remarkable fact that less attention is given to the conditioning of wood for the purpose for which it is to be used than is given any other material. With iron and the metals greatest care and the most expert knowledge are used in their preparation. With wood, however, the total value of whose products exceeds that of every other substance except agricultural products, up to the present very little expert attention has been paid to the conditioning. The idea seems to have been that Nature will take care of her own and that the wood can be allowed to dry almost any way. When it is considered that the quality of the finished product is in part entirely dependent upon the process that has been used in drying, for any injury produced in the drying process can not subsequently be rectified, the importance of the subject of proper drying becomes evident.

Agriculture

Before discussing the drying of wood a brief description of its structure and composition will be of assistance. If you will think of a honeycomb it will perhaps give you a good idea of the way in which wood is constructed, except that the cells are very much longer in proportion to their width than in the honeycomb, and they are not as uniform. In the softwoods or conifers they are all pretty uniform in shape and size but in the hardwoods they vary greatly in the stick, some being fifty times as wide as others, the wide ones being termed vessels and the narrow ones wood fibres. Interspersed between these vertical cells and fibres are the medullary rays, appearing as the silver grain on quarter-sawed oak, and running in a horizontal radial direction. The Forest Service is making a detailed study of the microscopic structure of all the important American woods and has prepared photomicrographs showing the structure as it appears under the micro-

scope. These have not yet been published, but may be seen at the Madison laboratory.

Water exists in green wood in two forms: As liquid water contained in the cavities of the cells or pores, and as "imbibed" water intimately absorbed in the substance of which the wood is composed. Now it is almost axiomatic that removal of the free water from the holes or pores will have no effect upon the physical properties or shrinkage of the wood, but as soon as any of the "imbibed" moisture is removed from the cell walls shrinkage begins to take place and other changes occur. The strength also begins to increase at this time. This condition of moisture, which is the point when the cell walls or wood substance became saturated, is called the "fibre saturation point." It is a very significant point in the drying of wood. It is easy to remove the free water from woods which will stand a high temperature, as it is only necessary to heat the wood slightly above the boiling point in a closed vessel which will allow the escape of the steam as it is formed but will not allow dry air to come in contact with the wood, so that the surface will not become dried below its fibre saturation point. This can be accomplished with most of the softwoods, but not as a rule with the hardwoods, as they are injured by the temperature necessary. When it comes to evaporating the "imbibed" moisture, there is where the difficulty comes in, and also where the free water has to be removed through its gradual transfusion instead of boiling. As soon as the imbibed moisture begins to be extracted from any portion shrinkage begins and stresses are set up in the wood which tend to cause checking. The fibre saturation point lies between moisture condition of 25 to 30 per cent. of the dry weight of the wood, according to species.

The Wood Substance

In regard to the substance of which wood is composed: It may surprise you to learn, if you are not already familiar with the fact, that it is half as heavy again as water. If any wood could be compressed so that all the air spaces were got rid of it would sink in water like a stone. The specific gravity of the wood substance is 1.56. This substance is the product of living processes; that is, it is organic, and its structure is, therefore, very complex. It is thought to be built up of small particles closely laid together, the interstices being capable of filling up with moisture. The foundation part of this substance is known as cellulose. Cotton is almost pure cellulose, but in wood there is another material combined with the cellulose called lignin. This has never been isolated by itself, but is known only in combination with other

substances. Just how it is combined with the cellulose is not well known. It adds to the strength of the cell walls and gives them a darker color. The chemical composition of cellulose is the same as that of starch, to which it is closely allied, and is represented by the formula $C_6H_{10}O_5$, the hydrogen and oxygen being combined in the same proportion as in water. By the addition of water to the molecule sugar is formed, and closely related substances. Thus cellulose, starch, and sugars occur in the living tree.

The term sap is an ambiguous expression. The sap in the tree really descends through the bark and except in early spring is not in the wood of the tree except in the medullary rays and living tissues in the "sapwood." It contains sugars, soluble gums, and closely allied materials. What flows through the sapwood is chiefly water with a slight amount of mineral substances in solution. The water rises from the roots through the sapwood to the leaves, where it is converted into true "sap" which descends through the bark and feeds the living tissues between the bark and the wood, which tissues make the annual growth of the trunk. Just what is meant by getting rid of the "sap," as is often said, in drying wood is not clear, since the wood itself contains very little true sap and the heartwood none. The wood contains, however, mineral substances, organic acids, and volatile oils and gums, as resin and cedar oil, etc.

Objects of Drying Wood

These may be grouped under three main headings:

1. To reduce shipping weight.
2. To reduce the quantity necessary to carry in stock.
3. To prepare the wood for use and improve its qualities.

When the wood will stand the temperature, drying to reduce weight is most easily accomplished by heating the wood above the boiling point in a closed chamber but so arranged that the excess steam produced will escape. This process manifestly does not apply to hardwoods but is applicable to many of the soft woods. It is used especially in the Northwest, where inch Douglas fir is dried in from forty to sixty-five hours and sometimes in as short as twenty-four hours. In latter case superheated steam at 300 deg. F. was forced into the chamber but, of course, the lumber could not be heated thereby much above the boiling point so long as it contained any free water. The heat of evaporation may be supplied either by superheated steam or by steam pipes within the kiln itself.

The quantity of wood it is necessary to hold in stock is naturally reduced when either of the other two objects is attained and, therefore, need not be discussed here.

In drying to prepare for use and to improve quality careful and technical drying is called for. This applies more particularly to the hardwoods, although it may be required for softwoods also.

Present practice of kiln drying varies tremendously and there is no uniformity or standard method. Temperatures vary anywhere from 65 to 165 deg. F., or even higher, and inch stuff three to six months on the sticks is being dried in from four days to three weeks, and 3-inch stuff in from two to five months. Many kilns make a hit at superficial points and fall down on the fundamentals.

Classification of Methods of Drying and Types of Kilns

All methods in use at atmospheric pressure may be classified under the following headings. The kilns may be either progressive or compartment, and preliminary steaming may or may not accompany any one of these methods:

1. Dry air. Generally obsolete.
2. Moist air.
 - a. Ventilated.
 - b. Forced draft.
 - c. Condensing.
 - d. Humidity regulated.
 - e. Oven or boiling.
3. Superheated steam.

In some cases there is practically no loss, but more often it ranges from 1 to 3 per cent., and 7 to 10 in refractory woods such as gum. In some cases the losses are as high as 33 per cent. Air drying is by no means always to be preferred to kiln drying. In air drying there is little or no control over the process; it may take place too rapidly some days and too slowly others; it may be very nonuniform. Hardwoods in large sizes almost invariably check. By proper kiln drying these unfavorable circumstances may be eliminated. However, air drying is unquestionably to be preferred to bad kiln drying, and when there is any doubt in the case it is generally safer to trust to air drying. Green lumber can be better dried in the kiln if the fundamental principles are all taken care of.

Some of the advantages of kiln drying to be secured over air drying in addition to reduction of shipping weight and lessening quantity of stock are the following.

- Less material lost.
- Better quality of product.
- Prevention of sap stain.
- Fixation of gums and resins.
- Reduction of hygroscopicity.

Experiments have shown that drying oak and ash at 145 to 170 deg. F. has reduced the hygroscopicity 15 to 25 per cent. Specimens from the same sticks were both air dried and kiln dried, then placed side by side on a rack for over a year, and their moisture contents then determined. This reduction in moisture means a reduction in the "working" of the material which, even though slight, is of very great importance.

Fundamental Principles

1. The evaporation from the surface of a stick should not exceed the rate which the moisture transfuses from the interior to the surface.
2. Moisture tends to transfuse from the hot toward the cold portions.
3. Wood is soft and plastic while hot and moist and will become set in whatever shape it is in as it dries.
4. Shrinkage is greater the higher the temperature of drying while still moist.
5. Case-hardening and honeycombing result from the two foregoing circumstances. It may be explained thus: Suppose a block of wood is very wet and is placed in at too high a temperature and too low a humidity. The surface begins to dry and tends to shrink but is prevented from doing so by the wet interior. Being plastic, it yields to this resistance and becomes stretched. If not plastic it will check open. As drying proceeds it becomes hard and set in this expanded condition and acts as a strong shell. The interior now dries very slowly, does not become set but shrinks, and as the exterior is already hard it opens up into honeycombing. When the exterior once becomes set or "case-hardened" the interior is almost certain to become honeycombed, whether the drying takes place in the kiln or a long time afterward. The only remedy is to moisten the exterior by steaming or soaking before it is too late. Air-dried material frequently case-hardens and honeycombs as well as kiln dried. (Samples of sections of white oak felloes exhibited showing one badly honeycombed and the other excellently dried.)
6. Drying should take place uniformly at all points; otherwise stresses are set up in the wood.
7. Brittleness is produced by drying too far.
8. Dried wood absorbs or loses moisture in proportion to the relative humidity in the air.
9. The hygroscopicity and working are reduced by the thorough drying but not eliminated.

To properly utilize these principles in drying attention should be given to the following factors:

1. The lumber should be heated clear through before drying begins.
2. Humidity should be correct at the start and reduced in the proper ratio as the drying progresses.
3. The temperature of the lumber should be uniform and as high as the kind of material will endure.
4. The rate of drying should be controlled by the amount of humidity in the air and not by the rate of circulation. The circulation should be ample at all points to supply the heat needed for vaporization and to keep the humidity uniform. To evaporate one pound of water at atmospheric pressure requires the amount of heat given up by 669,000 cubic feet of dry air in falling one degree Fahrenheit. The regulation of the humidity is to prevent the surface from drying down to the point where it takes a "set" before the interior has dried to nearly the same amount, thus preventing casehardening. If dried too rapidly casehardening will result.
5. The degree of dryness obtained should conform with the use to which the wood is to be put.

Ideal drying depends upon:

- Ample circulation.
- Control of humidity at all times.
- Proper temperature.

Any kiln which fulfills these conditions should be capable of giving perfect drying.

Objection Taken to Increased Pulpwood Freight Rates

The International Paper Company and a number of other manufacturers of paper and lumber have filed a complaint with the Interstate Commerce Commission at Washington, D.C., against the advances recently made in freight rates on pulpwood from points in Eastern Canada, to the United States. The following typical increases are mentioned in the complaint:—

	Present rate	New rate
From Grand Piles, P.Q., to Mechanicsville, N.Y. ...	9c	11c
From Fillion P.Q., to Watertown, N.Y. ...	10½c	12c
From Point Levi, P.Q., to Ft. Edward, N.Y. ...	8c	9c
From Drummondville, P.Q., to Bellows Falls, Vt. ...	9c	9½c
From Point Levi, P.Q., to Watertown, N.Y. ...	9½c	10½c
From Quebec, P.Q., to Fulton, N.Y. ...	13½c	14½c

How Often Should Log Saws be Sharpened?

How many times during his experience with saws does the average mill man have some one approach him on the subject of how long a saw should be run on a single sharpening? There is usually a motive behind it all; sometimes it is a matter of dollars and cents, as in the case of the saw salesman. Again, it may be simply that he has noticed that some one is doing something a little different from his way and he tries to see if he can influence the other fellow to do what he is doing. This is done in a spirit of good-fellowship, which, as a matter of fact, is one of the true elements that enters into the trend of conversation when the subject of "saws" is approached.

It seems sometimes that some, at least, do not stop to think there is a wide latitude to be considered when specifying the exact length of time one sharpening will hold out. Logs taken from a pond where they have been in store for a long time, washing and rinsing the dirt and gravel out of the bark, are one of the easiest propositions a saw can be offered. Take those same logs and drag them through a half mile of cradle-knolls and quagmires, and if any filer can get the same results from a single sharpening, the title of "filer" is but little short of an insult to his skill; he must be a wizard. To say that two and one-half hours is as long as a saw will run in the clean, soft, water-soaked logs, is putting it in a wrong light, setting the time much too short. And to say that they should get good results for two and one-half hours in the latter logs, in nine cases out of ten would not prove right.

If the saw is put into logs of equal cleanliness, one of mountain spruce such as is found in New England, it will not last as long or make as long a run as it will in the pine that grows in the same locality, or even some of the hardwoods. Then not only is it a question of eliminating the sand and gravel, but the fiber of the wood, even the same timber grown on different soil, is of no little consequence. To stop and think for a moment of the 200 or 300 varieties of merchantable timber there is being sawn in North America alone, one cannot but see at a glance that there is too much to be expressed in a single sentence, and the time can't be pointed out with the two hands on the clock.

A saw in use, sawing pitchy lumber, like southern pine, will not run as long after it is beginning to get dull as it will in trees of deciduous growth, yet the actual strain on the saw in the cut is just the reverse of the practical interpretation of things at first glance. Here the real drawback is not so much in the condition of the cutting points as it is in the general condition of the saw. The pitch gathered on the sides of the teeth gives them a tendency to vibrate, and as a consequence the teeth are more likely to make washboards than if they were clean. A half-dull tooth will cut crooked lines oftener, when loaded with pitch, than a very dull tooth will in the same kind of lumber if it is clean. The saw trying to cut with vibrating teeth, in soft stock, is subjected to vastly more strain than it would be if sawing the hardest kind of timber with clean, steady teeth.

To get away from the logs and consider the stunts that saws have to do to lumber from a drykiln, or boards, which have been stacked alongside of some dusty road, near some sand bank or near a railroad track, if one is trying to give advice that cannot be refuted, is a subject that should not be broached excepting in low tones. If any one can tell how much longer a thin resaw will run in sand than it will in coal clinkers (make a statement that will prove out every time), his advice would be of value in one's store of knowledge when trying to determine how much he has to "hurry up" to get the next saw ready on time. And incidentally he might have "second sight" equal to the task of instructing some of us how to not break so many of the ten commandments every time our saws get busy on that sort of material. It is obvious that some conclusion must soon be reached, when the saw is put in contact with a lot of foreign substances in the lumber, and that it must necessarily be a dull saw in a very short time. Eliminate all foreign substances and the results are the extreme opposite, a fairly sharp saw after a long run.

Another thing that is of necessity a matter to be considered is, the quality of work required of the saws. In some places the resaw capacity is hardly equal to the amount of sawing that has to be done to keep things going with a steady move, and it must be pushed hard, with little regard to the quality of output. Then, of course, a saw will not run as long on a wide-open feed as it would on a medium feed. Where mills are equipped with plenty of resaw capacity, that is usually the place where the quality of work comes ahead of quantity every time. When such a plant is located, it will be readily seen that output is just as profitable to the owner as in the place where they sacrifice quality for the sake of speed.

A band saw is as treacherous a thing, when you approach a point nearing its capacity, as anything one can imagine. It may be working fine on a 60-ft. feed, but push it up to a 70-ft. feed and it will begin to lie down. The result is usually an inferior quality of work, much more than offsetting the gain in quantity. Do what you will, a saw cannot be rushed beyond what it is put up for, and do good

work. Neither can the saw be underfed and get good results for any length of time. Either will soon get the best fitted saws to working badly. Just try a guess on this matter, and you will find that the length of the run at one sharpening will vary to the extent of hours, if the lumber is nothing but clean stock—no bark, sand, gravel or nails.

Here is my opinion, gained from actual experience: A single band, properly fitted, will stand a reasonable feed and run out from 50,000 to 65,000 feet of lumber, barring about three of the hardest grades, on a single sharpening. A twin band will do about 90,000 to 100,000 feet on a single sharpening under the same conditions. If they fall very much short of this there are some faulty conditions, either in the machine or the fitting. And a saw that will not complete the above-stipulated run in one and one-half days is not being operated in close keeping with the times. This is considered on the basis of 1-in. stock, resawed once.

You can sometimes guess at things and feel you are all to the good, but later on find if you had guessed differently you would have been nearer to the real facts. The man who believes two and one-half hours to be the limit on any feed, in any kind of stock, that a saw should be run on a single sharpening, has as good right to his opinion as any one, but fifteen or sixteen years of saw-fitting has never proved it to my satisfaction. A very good practice, in my opinion, is to pick out for a sawyer a man with good eyes and ears, give him well-fitted saws, and tell him to run them as long as they run straight and feed them as fast as they will do the work properly. Tell him to take the saw off when it does not go straight, and insist upon his doing so, no matter if it has been at work two hours or two days. In a properly arranged factory it is only ten minutes' work to change, and in a properly arranged log saw mill fifteen minutes is sufficient time. Then, if this time cannot be made up in the following two hours, it is evident that the change was not necessary. If you tie yourself to a limit of hours, and keep close record, many changes will soon be recorded which were not necessary.—B. R. L. in *The Woodworker* Indianapolis.

Brush Disposal

An interesting discussion of the brush disposal problem in connection with lumbering operations, with a view to the prevention of forest fires, is contained in a recent book entitled "Forest Protection in Canada," published by the Commission of Conservation and written by Mr. Clyde Leavitt. In the course of the article, Mr. Leavitt writes in part as follows:—The large areas of inflammable material following old-style lumbering operations are almost certain to catch fire sooner or later. As a matter of fact, most of the serious fires have started in slashings. Control of such fires in dry seasons is almost impossible, and the loss of life and property has been enormous.

In addition to the destruction of merchantable timber on adjacent lands, the second crop on the cut-over lands is, in case of a forest of mixed age-classes, retarded by fire for at least fifty to one hundred years, through the destruction of the young growth under merchantable size. This of course does not apply to a forest where the trees are practically all of merchantable size, especially where fire, following cutting, facilitates reproduction as is true of Douglas fir on the Pacific Coast and of western white pine in the interior.

Situation in Canada

In contrast to the short-sighted policy which so long prevailed in the United States, the Dominion and Provincial Governments of Canada have wisely retained the ownership of non-agricultural lands to a very large extent, disposing for the most part only of the right to cut timber under specified conditions. Thus, the necessity for voluntary action through the formation of lumbermen's associations is not nearly so urgent as in the United States. With the exception of the relatively small percentage of timber land in private ownership, the situation is, in the long run, within the control of the Dominion and Provincial Governments, in connection with the issuance of new licenses and renewals of those previously issued. In some cases, all that is needed is the enforcement of provisions already included within licenses. This is particularly true of those issued by the Dominion Government, where ample provision is made on paper for brush disposal but where these provisions have not been enforced. This continued lack of enforcement has resulted in what is doubtless regarded by many of the licensees as a sort of vested right, which it will no doubt be difficult to overcome.

Brush Disposal Necessary

While patrols, the use of spark arresters, care with camp-fires, and similar measures are, and will continue to be, necessary, the root of the problem so far as the slashing menace is concerned, can best be reached through the adoption of measures for the disposal of debris from woods operations, in sections where the fire danger is extreme. It must be recognized that conditions vary widely, and that measures to be taken must be justified by the intensity of the fire

danger, and must also be practicable from a business point of view.

In the past, when stumpage values were low, and the margin of profit small, owing to large supplies and keen competition for the market, intensive methods could not be practised. Now, however, timber values are becoming sufficiently high to justify the owner in spending money to protect his remaining timber from fire, and, to a certain extent, in protecting the young growth for the sake of later cuttings. This is particularly true in the pulpwood sections, where repeated operations are practicable within reasonable limits of time. This consideration, however, should appeal with especial force to the Provincial and Dominion Governments in Canada, which, fortunately, still retain to a very large extent the ownership of immense areas of non-agricultural lands which are suitable only for the production of timber. Governments can best afford to hold lands for forest production, on account of the long time element involved and thus are particularly interested in maintaining the forest productive capacity of their non-agricultural lands. The question of fire-protection and thus of brush disposal should appeal to government agencies with especial force.

Disposal of Conifers and Hardwoods

Brush disposal as a fire-preventive measure is generally considered at the present time only in connection with coniferous or so-called evergreen species,—the spruces, firs, pines, hemlock, etc.—as contrasted with the so-called hardwoods or broad-leaved species, such as the maples, beech, birch, etc. Coniferous species are found almost exclusively in the West. In the northeastern United States and Eastern Canada the principal species being cut on a large scale are also conifers. The hardwoods rot much more quickly than do the conifers, so that the debris disappears by decay in a much shorter time. Further, the danger of fire in a hardwood slashing is in no way comparable at any time to the danger in a coniferous slashing. It should also be borne in mind that in a hardwood forest, the fire danger is due to the leaf litter rather than to the tops, though the tops may increase the severity of a fire once it is started.

Lopping the tops in hardwoods will not minimize the danger of a leaf fire, although it may possibly do so if the trees are cut in full leaf in the late summer or early fall. If such a leaf fire gets started in hardwoods it is in any event almost certain to kill any reproduction in its way. A further point is the fact that under present conditions the stumpage values of hardwood species are generally too low to justify the extra expenditure that would be involved in any plan of brush disposal. Many large areas of hardwoods can not be operated even now, without any expense of this kind, and undoubtedly the imposition of such a requirement would not only delay the day when such tracts can be operated, but would convert into a loss, or at least very materially reduce, the profits on hardwood operations which are now being carried on in portions of the eastern United States and Canada. Where cordwood is taken out as a part of the hardwood operation, the need for considering brush disposal is very greatly reduced, entirely aside from the financial consideration.

Methods of Disposal

So far as possible, brush disposal should keep pace with logging. Deep snow may, however, make this impracticable. In case of summer operations, where there is danger of fire spreading, the brush should be piled as the operation proceeds, leaving the burning to be done at a safe time later, as after a rain or a light fall of snow.

Under some conditions, sufficient protection from fire may be secured by the burning of brush so as to form broad fire lines, particularly along railways or wagon roads, laid out in such manner as to do the least injury to young growth. The necessity for general burning is decreased if an efficient system of patrol is provided.

There are four general methods of brush disposal, which are more or less closely related. These are: (1) Burning; (2) Lopping; (3) Lopping and piling; (4) Lopping and scattering.

Burning may be either broadcast, or following lopping and piling. In the coast type of the Pacific northwest, broadcast burning has been found most practicable under certain conditions. This applies to sections where the stand is very heavy and the trees are practically all mature, so that the operation amounts to a clear-cutting, with practically no young growth left worth the extra cost of protection. The slash is left scattered as in old-style lumbering operations and is often four to five feet deep all over the ground. An efficient fire line is made around the slashing by the removal of all inflammable material on a wide strip. The tract is then burned off, but in order to ensure a clean burn and at the same time avoid danger of the fire spreading beyond control, and into green timber, it is necessary to employ men thoroughly experienced in this line of work, and great care must be used in selecting the time for burning. This procedure results in exposing the mineral soil, thus facilitating the reproduction of Douglas fir, which species is considered of superior desirability. Broadcast burning can be done at a much lower cost than piling and burning. It is reported that under favorable conditions this work can be

done for as little as 25 cents per acre. Probably, however, in most cases, it will cost from 5 to 10 cents for each thousand feet of timber cut.

Piling and burning are indicated for sections where the cutting is not clean and where, as a result, the remaining young growth of mature or semi-mature timber must be protected and the fire danger is so great as to require the elimination of the slash menace. This method is very frequently adopted in connection with timber sales by the United States Forest Service in the Western States. It must, however, be regarded primarily as a fire-protective measure, and where cutting is done in the winter, as in parts of Minnesota and the Rocky Mountain region of the United States, it has been found entirely practicable to burn the brush as the operation proceeds. The added cost of piling and burning is in part offset by the greater ease of skidding.

Lopping

The disadvantages of burning brush will, under some conditions, outweigh the advantages, thus rendering some other form of brush disposal desirable. For instance, in the Adirondacks, the burning of brush is considered impracticable, partly on account of cost and partly on account of the great danger of soil fires, with resultant loss of young and old growth.

The whole theory of lopping brush is that by this means the debris is brought into much closer contact with the ground, so that it will absorb moisture more readily, dry out less in summer, and decay more rapidly than when propped high above the ground. If the work is properly done, brush handled in this way largely ceases to be a fire menace in a very few years, and will practically disappear by decay in from one-third to one-half the time required for brush supported off the ground, as are unlopped tops under ordinary conditions. Following the lopping operation, piling or scattering is usually advisable, unless the added cost renders this impracticable.

The article concludes with a consideration of the methods of "lopping and piling" and "lopping and scattering," each of which is adapted to different localities and circumstances. Much interesting information is also included regarding brush disposal methods in various national forests in the United States.

Mr. Hall Kelly has introduced into the Quebec Legislature two amending bills dealing with the expropriation of land required for the transmission of water for pulp and power mills and the laying of pipes under private land. At present lands expropriated cannot be occupied until the money is paid over but Mr. Kelly proposes under one bill that companies shall be allowed to deposit the money in court and use the land, and thus prevent development from being retarded. The other bill, relating to pipes under private lands, is designed to overcome objections sometimes met with in cases where water has to be brought to mills. The bill enables pipes to be laid under private property subject to the payment of damages.

Panama Canal's Effect Upon B. C. Trade

Col. A. D. McRae, of the Canadian Western Lumber Company, in a recent interview spoke of the effect of the Panama Canal upon the lumber trade and upon trade in general. In regard to the general effect he expressed the opinion that the benefit would only make itself felt slowly. Trade routes were built up gradually. He believed that it would be five to fifteen years before the west would fully feel the advantage of the opening of the canal. Speaking of the effect upon the lumber trade, he said that he expected it to be more marked. The Southern States, for example, had been selling four million feet of lumber per year, largely short lengths, to the West Indies. With the opening of the canal, Western Canada would be able, on account of advantageous freight, to take a large percentage of this business. This was a class of lumber also which was rather scarce in the Southern States, but abundant in Western Canada. A large parcel-business in lumber would also be worked up with Europe. A decrease from \$5 to \$7 per thousand feet of freight rates would mean that many European buyers would be able to buy small amounts of lumber in markets where formerly they had only been able to buy by ship loads. This should mean a large increase in the total trade of Western Canada. Col. McRae also thought it probable that the removal of duty upon lumber entering the United States would have a good effect upon the Canadian industry. He would not be surprised if the Canadian Western Lumber Company operated its mills on night shifts again next year, on account of this additional demand.

A recent cable from London says: At the annual meeting of the British Wood Pulp Association Dr. Pelletier, the Agent-General for Quebec, warned the British papermakers that American capitalists were trying to locate the best timber limits and the greatest water-power in Canada, and that it would not be long before the Americans would be in possession of a large share of the Dominion's pulpwood.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Timber limit consisting of 10,000,000 feet of Pine, Spruce, Hemlock and Hardwood, tributary to Lake Nipissing. Also sawmill and logging outfit, boom timber and chains. Good reason for selling. For particulars address Box 846, Canada Lumberman, Toronto. 19-t.f.

Sale by Auction of Valuable Timber Limits

Public Notice is hereby given that on Thursday, January 15th, 1914, at ten o'clock a.m., the timber limits hereinafter mentioned will be offered for sale by public auction at our offices.

License No. 110 Callieres South 17 square miles.

License No. 110 Callieres North 28½ square miles

with saw mill equipped with machinery and 132 acres, more or less, freehold land at Port aux Quilles, St. Simeon Charlevoix County.

Conditions of sale: Ten per centum cash on adjudication, the balance payable upon transfer of the licenses, which transfers will have to be payable to the Crown Lands Department of the Province of Quebec by the purchaser, who will also pay the auction duty and will have to accept the licenses and property with any responsibility on the part of the vendor save that the licenses have been issued and are his property and to furnish titles to the freehold property, mills and machinery.

For inspection of the licenses and other particulars apply to

LARUE & TRUDEL,

Accountants,

Dominion Building,

24-1 126 St. Peter Street, Quebec.

Saw Mill Property For Sale or Rent

The following are some of its leading features: Situated near Little Current, on the Georgian Bay, on what is known as Picnic Island. Contains 37 acres of freehold property which includes the mill and more than twenty other buildings. It has been leased by the Wolverine Lumber Company during the past seven years, and their lease expires the first of January next. If they buy more limits they may likely continue the lease. In the meantime we are offering the property for sale or rent. The mill has been cutting about 20,000,000 a year on small logs and a ten-hour day. The Island is in unorganized territory and our yearly tax on it is only one cent an acre in addition to the Little Current school tax of about twenty-five dollars a year. The power consists of two engines—a 24 x 30-inch and a 20 x 20-inch cylinder. Five boilers 60-inch diameter by 16 feet long. A double cutting band, a wickes gang (36-inch) and a circular saw. Two trimmers, two edgers and good lath mill capacity. The protection against fire is probably the best on the Georgian Bay; with a fine large pump in the machine shop, and a water tank outside ninety feet high with water pipes leading to the mill and all the houses on the Island, four streams at once can be thrown on the mill. We carry \$62,000 insurance on the mill and on all the buildings, the average rate being less than four per cent. Our piling capacity consists of 2,200 feet of stone-filled docks holding about ten-million feet, and ten million more in the rear on the ground. Vessels can load at the docks to sixteen-foot drafts and be well sheltered. First-class booming room for about 15,000,000 feet of logs, 650 booms and chains. We carry boiler insurance, and the inspectors' report this year testifies that everything is in good condition. The average loss of time during the past six years is probably less than three days in the season for repairs, and the quality of the manufacture is among the very best on the Georgian Bay. To build up this property at the present time would cost at the least \$200,000, but we do not care to go back to the active work of running it, and will sell the property free of encumbrance for \$75,000 and on easy terms of payment. There is now a railroad running into Little Current which will materially increase the value of this property. If we do not sell soon, would lease it for a term of years at a reasonable rent, and will be pleased to correspond with interested parties. For further particulars apply to the undersigned.

Thos. Conlon,

44 Church Street,

24-1-2-3 St. Catharines, Ont.

For Sale by Tender

Tenders will be received by the undersigned up to twelve o'clock noon on

Wednesday the 18th March, 1914
for the purchase of the following assets of the

Northern Islands Pulpwood Company, Limited Port Arthur, Ontario

Parcel 1.

Real estate, being lots 1, 2, 3, 4 and 5 of Subdivision of Park Lot 2, North John Street, City of Port Arthur, Ontario, 133 ft. by 131 ft., more or less, on Johnson Avenue, valued at \$12,000.00.

Parcel 2.

Pulpwood lands in Lyon Township, District of Thunder Bay;

	Acres
Lot A-19 locations, having an area of approximately	2,901.92
Lot B-12 locations, having an area of approximately	1,709.50
Lot C-57 locations, having an area of approximately	9,310.02
	13,921.44

Estimated to contain 125,000 cords of wood. Buildings and erections thereon valued at \$ 7,050.00
River and road expenditures 14,056.00
Sawmill, Lot B. 94 by 20, valued at 5,184.55
Machinery and Equipment, valued at 22,747.81
Camp Equipment, as per Inventory. 11,459.74
Horses 3,860.00

Parcel 3.

Equities and Rights of the Company in certain Licenses, permitting, under terms, cutting of pulpwood on Lands known as Nipigon Mining Lands in District of Thunder Bay, as per list having an approximate area of 63,863 acres.

Parcel 4.**(A)**

Equities and rights of the Company in certain licenses, permitting under terms, cutting of pulpwood on Lands known as the Whalen Lands, in Lyon Township, District of Thunder Bay, as per list, having an approximate area of 1,132½ acres.

(B)

Equities and rights of the Company in certain licenses, permitting under terms, cutting of pulpwood on Lands known as the Squaw Creek Lands, in Lyon Township, District of Thunder Bay, as per list, having an approximate area of 2,084½ acres.

Parcel 5.

Equities and rights of the company in certain licenses, permitting under terms, cutting of pulpwood on Lands known as Magnet Point Lands in Black Bay of Lake Superior to be located under Veteran Scrip, as per list, having an area approximately of 5,120 acres.

Parcel 6.

Equity in agreement to purchase Black Sturgeon Lands, having an area of 8,000 acres, against which there is a debt of \$52,000.00.

Parcel 7.

Camp Supplies, as per Inventory . . . 6,058.26

Parcel 8.

Pulpwood and Piling, as per Inventory 2,400.00

Parcel 9.

Launches, Motor Boats, Boom Sticks and Chains, as per Inventory . . . 10,972.35

Tenders will be received for the nine parcels en bloc and tenderers are required to state amount apportioned by them to each parcel.

Tenders will also be received for the parcels separately, and in case the whole property can be sold more satisfactorily in parcels, such tenders may be accepted.

Inventories may be seen on application to the Assignee.

TERMS OF SALE

One-fourth cash, ten per cent. at time of sale, and balance in two, four and six months thereafter, with interest at six per cent. satisfactorily secured. Marked cheque payable to the order of G. T. Clarkson, Assignee, for ten per cent. of amount of tender must accompany each tender, which cheque will be returned if the tender be not accepted.

The highest or any tender not necessarily accepted. As to Parcel 1, the purchaser shall search the title at his own expense and the vendors shall not be required to furnish any abstracts, deeds, or other evidence of title, except those in his possession. The purchaser shall have ten days in which to make objections or requisitions, which, if the vendor shall from any cause be unable or unwilling to answer, the vendor may then rescind the sale, in which case the purchaser shall be entitled only to a return of the deposit money, without interest, costs or compensation.

As to Parcel 2, lots are sold without guarantee as to title, quantity of lands, or estimates of timber thereon, and purchaser must accept title of the Assignee as it stands.

As to Parcels 3, 4, 5 and 6, the purchaser will be required to accept such equities and rights as are vested in the Assignee, full particulars of which will be furnished on application.

As to Parcels 8 and 9, these parcels are offered subject to prior sale.

For any of the Parcels, 7, 8 or 9, tenders must be for the whole amount of the parcel. Should there be any shortage, the same will be adjusted on the basis of shorts and longs, having regard to inventory prices, as compared with the combined value of the items in each parcel, as stated on this advertisement.

Tenders will be opened at the office of the Assignee, 33 Scott Street, Toronto, at ten o'clock in the forenoon of Thursday, the 19th day of March, 1914, when all tenderers are requested to be present.

Further particulars may be obtained on application to the Assignee.

Dated at Toronto this 4th day of December, 1913.

G. T. CLARKSON, Assignee,
15 Wellington Street, Toronto.

This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

The town of Cornwall, on the bank of the St. Lawrence River, in northeastern Ontario, sends \$2,500 a year into the United States to buy the choicest hickory that can be found between Arkansas and New England; and when the hickory arrives it is carefully stored until the stormy weather of winter sets in. About that time a small troupe of Indians,

from eight to a dozen, arrive at Cornwall from the back country where they spent the summer in idleness. The hickory billets are turned over to them, and they begin their winter work of whittling lacrosse sticks. By the time the warm days of spring call the children of the wilderness back to the wild, they have reduced the hickory to the finished product, and they depart for the frontiers, leaving others to put the sticks on the market and collect the cash from the sales.

The manufacture of pulp wood in Canada is on an increasing scale, according to the report recently issued by the Canadian Forestry Department, and although the forty-eight pulp wood mills reported in 1912 to have manufactured pulp wood to the value of five million two hundred and fifteen thousand five hundred and eighty-two dollars, the quantity consumed showed an increase of over twenty-eight per cent., and six million five hundred and twenty-four thousand dollars worth of pulp was imported.

Review of Current Trade Conditions

Ontario

The lumber trade in Ontario is undoubtedly quieter than is usual at this time of year, yet there is general feeling that business will improve early in the new year, after a little longer rest. Yards are ordering very carefully, for immediate requirements only, speculative buying being absent entirely. Payments are being made with fair regularity though they are a little slow in a few cases. The general trade situation appears to be a little slower than usual but fairly healthy.

Spruce continues strong on account of eastern manufacturers having a good outlet in the Eastern States since the removal of the duty. Mill run spruce is now selling at \$16 to \$18, whereas, before the duty into the States was removed, it could be had at \$15 to \$16. Hemlock continues scarce. Pine has not been able to stiffen up like hemlock, as southern pine and spruce have been strong competitors. Lumber stocks in Ontario are low and favor strong prices. An improvement in the financial situation would soon be reflected in stiffer prices generally. Lath are almost out of the market and are in good demand. The shingle market is quiet.

The hardwood market is quiet, though some wholesalers report quite a good trade. Those who are doing well, however, are the active ones who get out and hunt for the business vigorously. It would not be correct to say that business is much quieter than usual at this time of year, which is always quiet. Reports from Montreal state that the export trade in birch is very quiet. Local Ontario and United States trade is fair. Collections are encouraging and indicate that the trade is ready for improvement as soon as it comes.

Ottawa Valley operators report that little or no snow has fallen in the eastern and northern sections. A heavy fall of snow, followed by a period of severe frost is required unless the cut is to be reduced, even as compared with last year. Prices at Ottawa are unchanged and local trade conditions are quiet.

Eastern Canada

The lumber trade at Montreal continues on a moderate scale and reports from various wholesalers are rather contradictory, some telling of good trade and some of poor. Stocks in general are low, particularly dry lumber in the common grades. There is a fair demand for lath, but stocks are light. Present indications are that wholesalers will show larger operations during 1913 than during 1912 and it is thought that similar reports will come from the retailers. Easier money during 1914 would undoubtedly place the demand for lumber upon something like its former basis. The demand for dimension timber is quiet and prices are low.

All the mills at St. John, N.B., with the exception of those of Stetson, Cutler & Company and Randolph and Baker, had finished their operations before Christmas. This and the holiday season combined to put trade upon the customary quiet basis which usually continues until the middle of March, when the mills again start running. Practically all the English deals are now in the hands of the principal shippers. Latest reports from Great Britain are to the effect that trade is fairly good, although there is much anxiety about the labor situation. English deals are steady at about \$16.50 to \$17.00 per M. for city cut. Present indications are that the cut of the rotary portables will be lighter this winter. Owners of American stocks are holding for better prices later on. The base price for schedules is about \$25. Lath are steady, the New York price being about \$4. Stocks of lath for sale are scarce. Logging conditions are still poor, as cold weather only commenced about the 20th of December. Operators expect the New Brunswick cut of logs to be less than last year.

Enquiry for eastern spruce at Boston has been somewhat better during the past fortnight, although, as a result of the slow and dragging trade of the past month or more, prices are being quoted in some cases, lower than they were in the early fall. The improvement of the past fortnight is probably due to the long spell of warm weather. Summer spruce mills, manufacturing dimensions, which have been shipping green lumber, are shut down and on account of the absence of snow, winter mills had not started up at the end of the year. Temporarily, therefore, there was a scarcity of spruce, which was reflected in the price of dimension. 10 in. and 12 in. are about 50c. higher at \$28 and 9 in. and under are selling at about \$26. This advance is expected to be only temporary and is usual at this time of year, whenever the snow is late in arriving. Southern pine and north Carolina pine, in the low grades, have been selling very cheaply in Boston and are weak. The demand for shingles is also dull.

Price quotations show an easing off in white pine uppers and se-

lects, 1 in. to 2 in., and in fine common white pine, 1 in. to 2 in., which range from \$1 to \$2, a similar reduction is shown in the place of barn boards, Nos. 1, 2 and 3, 1 x 12. Canadian spruce boards are also about \$1 easier. Lath are 10c. lower for 1½ in. spruce at \$3.90. New Brunswick shingles are easier at the following prices: extras \$3.55 to \$3.75; clears, \$3.30 to \$3.40; 2nd clears, \$2.75 to \$2.85; clear whites, \$2.65 to \$2.95; red cedar extras, 16 in., five butts to 2 in., \$3.65; Washington, 16 in., five butts to 2 in. extra red cedars, \$3.60 to \$3.80. Eastern hemlock stocks are moving slowly at Boston. Sales have been made of 10 in. to 16 in. butted at \$23 to \$23.50. Random lengths vary from \$1 to \$1.50 lower.

At New York, the prices are holding about steady on eastern spruce. Random stock is not very active. Yard stocks are light and so are enquiries. The volume of trade in hemlock is lower than usual at this time of year.

Great Britain

In welcome contrast to the rather gloomy trade reports which have been published in connection with business in Great Britain of late, come the Board of Trade reports for the month of November. Judging from the comments of the leading financial and commercial papers, the figures are much more encouraging than was generally expected. The wood trade, along with all other branches of commerce, gave evidence of a pessimistic spirit during November, and trade statistics were awaited with some anxiety. It would not have been a surprise if a considerable decrease had been shown in the volume of the oversea trade. The statistics, however, are of a more favorable nature than was expected and may reasonably be taken as good ground for encouragement. Exports show an expansion of £1,397,000, an increase of three per cent. as compared with the figures of November, 1912. Imports show a decrease of £2,514,000, a little over three per cent. The month of November, however, contained one working day less in 1913 than in 1912. Exports of nearly all stable industries expanded during November. The principal reductions were in iron and steel. In this case, however, the reduction was only in value, the quantity being greater. In the imports, nearly half the decrease occurred in cotton. Taking the month as a whole, the statistics have given quite a hopeful feeling to industry. This is considered as an induction that, although the crest of the wave of trade prosperity may have been reached, no real contraction is under way. This is especially noticeable when one considers that comparisons in 1913 are made with those of 1912, when all previous records were greatly surpassed.

The timber trade at London, during the past fortnight, was quiet, as a result of the approaching end of the year. Values have shown no alterations, good stocks holding their prices, although stocks that are off color have been hard to sell. Deliveries at London docks during the week ending December 6th totalled 4,501 standards, as compared with 5,862 standards and 4,695 standards for the corresponding weeks in 1912 and 1911, respectively. At Churchill & Sim's recent auction sale, 3 x 9 second Quebec spruce was sold for £12 10s. and £12 5s., while 3 x 7 brought £10 10s. and £10 5s.

The trade in spruce deals for future arrival at Liverpool is quiet, as is usual at this time of year. Operations are now confined to small shipments by the liners, and will so continue during the winter months. A fair consumption is in progress for the time of year, as a result of the mild weather, which is favorable for building operations. At Manchester, timber trade conditions are favorable. Prices are firm at about £10 5s., ex quay for 3 x 7 in. spruce as a basis. Pine goods, especially deals of all qualities are very firm. Wide Miramichi deals have been sold at about £14 per standard, which is a record.

United States

Business conditions continue to provide a puzzle in the United States. Very conflicting reports are received, although with the end of the year, there was a general slowing down and a decrease in the volume of business. Orders have been very largely for immediate requirements and have been marked with the "rush" sign, which is taken by some to be a cheerful indication in connection with the trade for 1914. There is no question whatever that stocks are at a minimum and that with normal business or anything approaching it, orders will have to be heavier in the very near future. Another sign of the times is the infrequency of cancellation of orders. Shipments have apparently reached the point where they cannot go much lower and it is generally believed that they must soon increase. A great deal of hesitation has been caused by the new currency bill, as business men have been waiting for its passage by Congress. It is thought that, with this

measure out of the way by the end of the year, strained money conditions should ease by the middle of January. Improvement thereafter may be slow, but should result in greater activity by early spring.

In the lumber business, buying to meet current demands for consumption is extensive. Some of the line yards have been placing many orders for delivery early next spring. Railroads also, are commencing to buy timbers, ties, etc., for repairs. In spite of the apprehension which has been felt in the lumber trade during the past few months, it is quite likely that lumber manufacturers, when making up their annual statements, will find that 1913 compared favorably with 1912. To substantiate this idea, one may point to the lumber receipts at Chicago, which broke a record during 1913 and were very nearly three billion feet. All these indications point to an active trade early in the new year.

The southern pine situation showed improvement towards the end of the year. The aggregate movement of all kinds of building lumber has been large and accumulations at the mills are not extensive. A normal spring demand should provide a good outlet for all kinds of yellow pine and place the market upon a fairly satisfactory basis. The chief difficulty in yellow pine at present is the low range of prices, which does not permit anything, but a very small profit. Apparently the competition among sellers has been much too keen for the small amount of business offered. Really profitable business can scarcely

be expected until the arrival of large orders and contracts ahead of delivery.

The trade on the Pacific Coast has apparently improved. Prices have not advanced, but the market is steadier and foreign shipments are extensive. Sugar pine and white pine mills have closed down for the winter. The season's cut was about up to normal and shipments have been at about the average.

Weather conditions are poor for northern loggers, who are dependent upon snow and frozen roads to do their hauling. White pine and Norway lumber are steady and there is a strong demand for the lower grades. The outlook in the north-western territory continues fairly active, on account of the mild weather. The factory trade is quiet. Stocks on hand are only moderate. The trade in hemlock is about at the average for this time of year. Consumption held up well during December. No accumulations of stock are reported from Pennsylvania mills and prices are expected to continue steady. Stocks in the north are light and broken. Generally speaking stocks are not plentiful and increased consumption would quickly strengthen values. A seasonable demand continues for hardwoods. Consumers have only light stocks and orders are quite plentiful. The end of the year financial statements will show that hardwood manufacturers have done a very fair business. Buyers are looking for maple and birch for future delivery.

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

St. John Trade Marking Time

St. John, N.B., December 22nd (Special to the Canada Lumberman): This is not the time to look for any expansion in the volume of business, especially from this port, as all the mills, with the exceptions of Messrs. Stetson, Cutler & Company and Randolph and Baker have ceased operating for the season. The holidays now taking place here and elsewhere are keeping trade quiet. Business in the lumber trade is about at a standstill and will really mark time, as it were, until about the middle of March, when the mills will get under way again. As to prices for stocks, little change can be said to have taken place. Really, there are no stocks for sale, as all the English deals are in the hands of the shippers here, viz., Messrs. W. M. Mackay, Geo. McLean and J. E. Moore & Company, and the American stocks, with a few exceptions, are in the hands of Messrs. Stetson, Cutler & Company. A certain quantity of English deals are being shipped on each liner sailing from here, but are said to be practically all on order. Business is reported to continue pretty good, on the other side of the water, and no immediate reductions in price are looked for. Of course, there is great unrest among the laborers in Great Britain, and should any serious strikes take place it would at once be reflected in the lumber trade. This, it is hoped, will not be the case.

Prices of English deals remain about as last quoted, viz., \$16.50 to \$17.00 per M. for city cut deals, with fourth quality and ends at the usual reductions. Portable rotary cutting of deals will not be as heavy in the lower sections of the Province during the coming winter, as was the case last year. The season has been very open, making the yarding of logs to the mills particularly difficult and limiting the amount of logs to be put up. Help of all kinds for woods works, is very scarce, and wages are higher than last year. Also, no inducements for good markets or prices were held out to these operators, by the buyers, and men were more or less discouraged. Stocks of English deals are not heavy, in fact are lighter than for some time, few of the mills here having any stock to speak of. American shipments are about at a standstill. Those who have American size prefer to await for better business in the States. The base pine for schedules is about \$25.00. The selling of random is a hard matter and a sacrifice would have to be made. Laths only remain firm, \$4.00 being about the New York price. About all laths on hand here have been sold.

Logging conditions have not improved to any great extent, the first cold weather having come within the last day or two, very little snow has fallen any where in the province, but as yet it has not been needed, as operators do not expect to begin hauling before January.

The cut of logs all over the Province will be less than last year, but as yet the extent of the shortage is hard to foretell.

Mr. Miller of Price and Pierce, London, England, is now in St. John, having arrived on this side some ten days ago. He is making a tour of the trade over the Province, in the interests of his house.

Ottawa Manufacturers Anxious for Snow

Ottawa, December 20th (Special to the Canada Lumberman): Unless a heavy fall of snow comes soon, followed by a spell of severe frost, lumbermen predict that operations in the woods will be seriously retarded and the cut this season will be even smaller than it was last, which will mean a substantial advance in prices next Spring. At present there is comparatively little snow in the eastern or northern sections of the country and lumbering operations are being delayed. Locally, conditions are quiet and there is no indication that they will improve until after the New Year. There has been no alteration in prices lately.

About the most interesting event that has happened this week is that the railways have decided to continue the cartage system after January 1st instead of cutting it off as they proposed. Last Tuesday, lumbermen, manufacturers and other shippers appeared before the Board of Railway Commissioners and asked the board to compel the railways to provide better facilities for handling in-going and out-going freight, since the railways had decided to withdraw from the business. At the hearing, representatives of the C. P. R. and Grand Trunk refused to consider the suggestion made by Vice-President Gundy of the Toronto Board of Trade, that the system be continued. To-day, however, the Board of Railway Commissioners announced that the railways had accepted the suggestion on condition that the shippers pay the exact cost of the service to the cartage companies, which, it is understood, they will be pleased to do. Frank Hawkins, secretary of the Canadian Lumbermen's Association, was at the hearing in the interests of the members of the association. The board was informed by the shippers that if the railways carried out their original proposal it would bring about a dislocation of business of all kinds.

A deputation of western and eastern farmers, representing the Western Grain Growers and the Dominion Grange waited on Premier Borden and his cabinet last Tuesday and asked among other things that lumber coming from the United States be placed on the free list. The farmers said that the free importation of lumber from the United States would enable them to get it cheaper than by buying in eastern or western Canada, from which points they have to pay high freight rates. Lumbermen would undoubtedly raise strong objections should the government show signs of acceding to the request of the farmers.

In the face of general talk about the financial stringency, it is interesting to note that there has been a substantial increase in the exports of forest and lumber products from Canada during the eight months of the present fiscal year. The figures are \$777,624,000, as against \$713,614,000 in 1912.

Mr. J. R. Booth, who was seriously injured sometime ago is still making good progress towards complete recovery. If he continues to gain in strength he will be able to get out in the course of a few weeks and go for a drive. His leg, which was broken, has not yet knitted thoroughly.

DRY SPRUCE BOARDS

WE have them and can ship promptly now, but cannot promise to do so later because the annual car shortage will be with us.

¶ We have the largest stock of dry Spruce boards in Canada. Our assortment is now complete, but with the volume of orders we are receiving we will be short of certain items before long. If you are going to need Spruce boards this Fall, order early and make sure of having them when you need them.

¶ When ordering get the best,—the Silk Finish kind,—from the most reliable source, from the people with the most up-to-date dressing mills, the most efficient service.

WE CARRY THE LARGEST AND BEST ASSORTMENT
OF DRY SPRUCE IN CANADA

Montreal Market Report—Trade Still Quiet

Montreal, December 23rd (Special to the Canada Lumberman): Having regard to the season, trade is on a moderate scale. Some wholesalers complain of dull times, while others state that business is quite satisfactory. Stocks are reported to be low, dry lumber being scarce, particularly the common qualities. Lath is in fair demand, but is in short supply.

The year which is drawing to an end has been, on the whole, a good one for most firms in the lumber trade. Many wholesalers have had a larger turnover than in 1912, and although there has been a tendency to hold up important building projects, the majority of retailers have probably transacted a larger trade than in the previous year. Should monetary conditions become easier in 1914, there is every prospect of a quickened demand for lumber. It is certain that several schemes which have been postponed will materialize, and in addition there is an ever-increasing demand for flats and residences—a demand which was not satisfied during 1913.

Business in dimension timber is very slow, although many contracts are outstanding. Complaint is also made that prices are very low, with the prospect, however, that quotations will advance next year.

Snow is required in the Eastern Townships, in order that hauling operations may be commenced after the turn of the year.

There is little change in the ground wood market. Inroads are being made upon the accumulated stocks on hand. There are three mills with heavy stocks, from the dull period through which the trade passed, and until these are absorbed prices have no prospect of advancing. Any serious curtailment, however, of the water power in the United States would have the effect of largely reducing the stored pulp. For fresh pulp \$17 to \$18 per ton at the mill is obtained in some instances.

The demand for chemical pulp is better. Prices for spot shipments have been easier, but makers are asking the same figures for contracts for next year. One of the largest mills in the United States has contracted for 85 per cent. of its production next year, although it is admitted that the mill has some surplus of the present year's make, owing to the curtailment of contract deliveries. The outlook for 1914 is very much better now that the full effect of the tariff legislation in the United States is discounted.

News print is in a good position, the Canadian mills having sufficient orders to keep them fully running. It is well known that the very large quantity of news that came onto the market from the new installations had a considerable effect upon the business of the United States mills, and that some new mills in that country have had to seek a market for their lines of paper in consequence of Canadian competition. This has caused a rearrangement of production in mills making lines other than news, and has somewhat disturbed the calculations of such mills. It is well understood there will be business for all, and that the advent of from 100 to 150 tons per day of news from new mills next year will not prove of a serious character, as the export market for news from some of the Quebec mills is growing very rapidly, particularly to South America.

Barbados Market Report

S. P. Musson, Son & Company, Barbados, report under date of December 5th, as follows:—Lumberstuffs—White Pine—Receipts during the fortnight have been heavy, consisting of 281 m. ft. by the Trn. Schr. "Santa Maria" from Ingraham Port, N.S., and 110 m. ft. by the "Burnett C," from Shelburne, N.S., to selves, and 237 m. ft. by the Trn. Schr. "Rescue" from Hantsport, N.S. All of these cargoes were previously contracted for at \$34 for merchantable, and \$26 for second quality, and arriving to an already overstocked market have had a very depressing effect, and we do not think there will be an opening for a cargo for some time to come. Spruce—The "Rescue" brought down 107 m. ft. which had been sold to arrive. Stocks of this description of lumber are also heavy, and dealers are not inclined to make any further purchases at present. Pitch pine—No receipts, but stocks are ample for present requirements. Shingles—The Trn. Schr. "Ainslie" arrived on the 1st inst. from Bonaventure, with 1,837,000 cedar laying, which had been sold to arrive at \$2.55. No receipts of Long Gaspé. Shooks.—The S.S. "Honoreva" from Mobile brought 200 bds., which had been imported by a dealer. Wood hoops—Receipts consist of 350 bds. by the S.S. "Catalina" imported on dealers' account.

London Market Report

Churchill and Sim, London, Eng., in their wood circular under date of December 4th say: There is little change to report in the conditions of the London Wood Market for November. Prices of stock of the better grades stored under cover in good condition have been a little stronger, and although, speaking generally, London is suffering

from an accumulation at present, the surplus quantity consists largely of rough boards and inferior descriptions of deals and battens, prices for which are consequently lower. The flooring position keeps strong and prices moved a point upwards during the month. Deliveries declined by some 3,000 standards, mainly due to the satisfying of the overside demand during the two previous months. Buying cannot be said to be general, yet sellers are showing no anxiety to press the market. This is a very wise policy, for most buyers are more heavily stocked than usual at the end of the season, and will require some respite before they can calculate their probable requirements for what promises to be a difficult year in which to make trading forecasts. Freight rates are easier, especially from the Lower Gulf at the present time, and quotations for Spring and Summer shipment are upon a lower level. Stocks of timber, deals, etc., at the public docks on the 30th November included the following:—

Colonial	1913.	1912.	1911.	1910.
Pine deals and battens in pieces	589,000	512,000	432,000	547,000
Red pine in pieces	21,000	24,000	48,000	73,000
Spruce ditto, in pieces	849,000	538,000	426,000	746,000
Oak timber in loads	—	—	32	51
Oak planks, etc (American)				
in loads	3,415	1,207	2,571	1,486
Birch timber in loads	319	226	403	350
Birch planks in loads	6,737	5,003	5,180	3,500
Elm timber in loads	1,540	547	841	1,179
Ash timber in loads	—	12	3	45
Yellow pine timber in loads	1,030	936	341	313
Red pine timber in loads	—	—	—	—

From the St. Lawrence has been imported—

Pine deals	492,000 pieces	against	548,000 pieces in 1912.
Spruce deals	1,033,000 pieces	against	721,000 pieces in 1912.
Birch planks	301,000 pieces	against	316,000 pieces in 1912.
and from New Brunswick—			
Pine deals	32,000 pieces	against	50,000 pieces in 1912.
Spruce deals	433,000 pieces	against	404,000 pieces in 1912.
Birch planks	336,000 pieces	against	384,000 pieces in 1912.

Pine and spruce have arrived freely during November and stocks have accumulated a little, especially spruce. Prices of pine deals have not altered, except for some inferior parcels, which are sold entirely on their merits and have little effect upon the value of the best stock. Prices of spruce declined during the month; they had driven to a very high figure, and the arrival of a little extra quantity was sufficient to put them down rather sharply, aided, as it was, by a resumption of business at the Lower Ports and easier rates of freight. There is no change to record in the position of Canadian hardwoods.

British Columbian and Oregon pine.—The arrival of two large cargoes has refreshed the stock, which was getting too low. Cheaper quotations for sailing tonnage ahead are checking business, and inspiring buyers with a fear of operating in a market which must be always more or less speculative, owing to the necessity so far in advance of requirements.

Liverpool Market Report

Farnworth & Jardine's wood circular under date of December 1st, say:—This market has continued very languid during the past month. Arrivals have not been excessive, but deliveries have again been disappointing, aggregating about 13 per cent. below the figures for the corresponding month last year. Stocks generally are adequate, and in some of the leading articles too heavy. Values have not fluctuated to any material extent. Ocean freight rates unchanged.

Canadian Woods—Pine timber—The arrivals have been nominal, but there is no improvement in the demand to report; values continue to rule high. Wane pine, 1st class: one small parcel of 20 loads has arrived at Manchester; some further inroads have been made on the stocks in that port, which are not now excessive; values are unchanged; second class is in limited demand; stocks though not heavy, appear quite sufficient. Square pine has not been imported, and there is little enquiry. Red pine—The stock is light, but this timber is seldom enquired for. Oak—The arrival to Manchester have amounted to 31,000 cubic feet; the bulk of this is on contract, and will largely go direct into consumption. Stocks are not excessive and values firm. Elm—No arrivals and a very limited demand; the small stock is firmly held. Pine deals have reached the market somewhat in excess of requirements; stocks are ample but values unchanged. Red pine deals have been only in limited demand.

New Brunswick and Nova Scotia Spruce and Pine deals—The import to the Mersey (including Manchester) amounted to 1,630 stds., against 1,910 stds., during the corresponding period last year, and practically all to Liverpool; deliveries from store were up to expectation, and the stock at Manchester has been considerably reduced, but is still heavy; for the remainder of the year it is expected that arrivals

Are You Drying Veneers?

Please do not waste your time reading this ad. if you are not desirous of getting bone dry and flat veneers. We do not want to reach you at all.

We want to reach any and every up-to-date manufacturer striving to make his veneered stock as near perfect as possible.

Such manufacturers we are in a position to aid considerably by installing one or more of our

Balanced Plate Driers with Breathing Motion

and we will put the Driers in your glueroom on a blanket guarantee when we know what kind of stock you are working on, size of your veneers and thickness.

Do you think you know all about it?

We know, you do not, because this is different from the toggle joint—flexible—leaky steam pipe propositions you have heard of before.

Our Catalog A will tell you a common sense story. It is yours for the asking.

Start the New Year right and put your glueroom department on a scientific basis—and do not blame the glueroom man for bad work if you do not know that he has perfectly dry stock to handle.

Merritt Manufacturing Company
Lockport, N. Y.

will be very light; values are barely maintained. Pine deals are in limited request at unchanged prices.

Birch.—Logs—One small shipment of Quebec timber has been landed at Liverpool; deliveries have again been small; values unchanged. Planks reached the market in moderate quantities and have continued in fair demand; stocks are not excessive; values steady.

United States Oak.—Logs—From Mobile 8,000 cubic feet have reached the Liverpool market. The demand is not active but stocks are moderate; values unchanged. **Oak planks—**The import during the past month has been moderate and the consumption shows a slight improvement; stocks are still heavy and including outside depots amount to 404,000 cubic feet, as compared with 343,000 this time last year.

British Columbia and Oregon Pine.—The arrivals have been to Liverpool and have consisted of 106,000 cubic feet of logs, 47,000 cubic feet of planks, and include an entire cargo from Bellingham, Wash. The great bulk of these arrivals still remain on the quay, but fair deliveries are now taking place at steady rates; stocks are quite sufficient for the existing demand.

Stocks at Liverpool and Manchester

H. W. Lightburne & Company, Liverpool, Eng., furnish the following statement of spruce, pine and birch at Liverpool and Manchester on December 1st, 1913:

Montreal Exports Decreased in 1913

Montreal, December 16th; (Special to the Canada Lumberman): In our last issue we published the preliminary statement of the exports of lumber from the port of Montreal during the past season. Below will be found the complete figures, showing that the exports declined by 3,551,595 feet, contrasting with an increase of 5,897,544 feet in 1912 over 1911.

	1913	1912
	Ft., B.M.	Ft., B.M.
Watson & Todd, Limited	34,596,642	33,217,881
R. Cox & Company	18,326,191	17,316,113
W. & J. Sharples	13,571,128	12,943,460
J. Burstall & Company	8,905,256	9,149,894

Australia and New Zealand	264,074
Great Britain and Continent	101,543,392
	105,819,167

Calendars for the New Year

The Midland Lumber Company, Union Trust Building, Parkersburg, West Virginia, are sending out a splendid office calendar for the year 1914, to their friends in the trade.

W. J. Smith, Weston, Ont., wholesale dealer in lumber, lath and shingles, has sent out an attractive calendar mounted on gray board and decorated with a colored picture entitled "When Nature Sleeps." The picture is a reproduction of a rural landscape in winter and is attractively colored.

A striking picture of a lumber yard scene is shown upon the calendar sent out by Joseph Bedard & Sons, Richmond, P.Q., "Quality and promptness" are characteristics of the business carried on by this firm and the picture on their calendar is an illustration of a yard in which these characteristics are evidently predominant.

West, Peachey & Sons, Simcoe, Ont., manufacturers of the celebrated Alligator Steam Warping Tugs, have again selected a design for their calendar which gives a graphic illustration of the splendid work done by these tugs. On the back of the calendar also is published a detailed description of the alligator tug and its work.

The Waterous Engine Works Company, Limited, Brantford, Ont., have sent out a fine large office calendar, handsomely designed and containing an excellent picture of their plant, surrounded by smaller pictures of several of their most important products. The calendar is specially designed for office purposes and will be very useful, on account of its large type.

One of the first calendars to reach the Canada Lumberman, for 1914 is an attractive souvenir sent out by the McGibbon Lumber Company, Penetang, Ont. The decoration is a striking picture in colors, entitled "A Woodland Sunset." The McGibbon Lumber Company are well known throughout Ontario and other parts of Canada as manufacturers of and dealers in lumber, lath, wood, etc.

A fine old sporting picture, painted by J. A. Mohlte, gives distinctiveness and charm to a large calendar sent out by Fred T. Smith, 310 Board of Trade Building, Montreal, P.Q., wholesale lumber dealer. The picture is entitled "His Favorite Mount" and represents a group of riding men in their characteristic hunting costumes, gazing at a large painting of a horse. The coloring of the picture is very attractive and striking. The calendar itself is printed in large type, making it very suitable for office purposes.

John Donogh & Company, Traders Bank Chambers, Toronto, have sent out to their friends in the lumber trade a large and striking calendar upon which the dates are printed in large type, specially useful in offices. The calendar is especially attractive to lumbermen on account of the interesting series of colored photographs which it contains, showing various important logging scenes, the whole grouped around a fine colored picture of an axe-man standing upon a log which he is chopping.

The Campbell-MacLaurin Lumber Company, Limited, Board of Trade Building, Montreal, P.Q., have again selected a very large calendar with an attractive colored picture for their new year souvenir. The title of the picture on the calendar is "Peaceful Valley," and it is a reproduction of a painting by Mr. M. H. Lowell, representing a picturesque farm house near a quiet stream. The calendar pad contains a record of the quarters of the moon and the type is very large, making it exceptionally useful for office purposes.

The Saw-Mill Owners Sales Company, Montreal, P.Q., have been especially successful in the selection of a calendar for the year 1914. "Softly the Evening Came" is the title of a beautiful photogravure colored by hand, which decorates the calendar. It represents a landscape at evening, the foreground being occupied by a stream and the background by the soft tints of an evening sunset. The picture is mounted upon cream colored board with a light brown margin and is tastefully subdivided into three panels which add greatly to the artistic effect.

The River Ouelle Pulp and Lumber Company, St. Pacome, P.Q., have chosen a splendid picture to decorate the calendar which they are sending to their friends in the trade for 1914. The calendar itself is handsomely designed and the colored picture is a reproduction of a painting by John MacWhirter, R.A., entitled "The Fallen Giant." The picture is reproduced by colored photography from an original oil painting and represents a fallen tree in a rough forest country. The beauty of the picture is in its simple composition and forcible coloring. Those who are fortunate enough to obtain copies of this calendar will prize it greatly.

Canada's Largest Lumber Manufacturing Plant

We are now operating the finest door plant in Canada

Our Fir Doors are the Cream of Quality, manufactured from the choicest Douglas Fir lumber, carefully selected and seasoned by the most improved methods, insuring the finest workmanship and beauty of finish.

WHY you should install the
Mahony Blower
 System in your Planing Mill

Fifty per cent. higher efficiency than any other on the market to-day, uses $\frac{1}{2}$ less power, costs less to install, no cyclone required, eliminates back pressure on the fan.
 I will undertake to increase the capacity of any system now installed 50 to 100% by the application of the Mahony Back Pressure valve on your fan, without using a scrap more of horse-power.
 YOU NEED this apparatus in your plant

showing lines of their stock patterns of interior trim in oak and birch, which should prove of interest to readers of the Canada Lumberman. This progressive company are placing on the market a line of goods which is becoming fast known for its high quality. Experienced workmen are employed in manufacturing these goods and careful inspection is made after every individual portion is made, thus insuring uniformity of output. The company will be glad to send any reader of this paper a catalogue upon request.

The Smart Turner Machine Company, Limited, Hamilton, Ont., are supplying the Armstead Wolvin Company, Limited, Port Arthur, Ont., with an automatic feed pump and receiver.

An Interesting Catalogue of Lumbering Tools

An interesting catalogue of lumbering tools, manufactured by Argall Bros., Three Rivers, P.Q., has just been published, which will be valuable to all logging operators. The catalogue is extensively illustrated and covers a variety of lumbering tools which will meet practically every requirement. Argall Bros., have been in business since 1860 and their products have set a standard for all other manufacturers. They are used in all parts of the country from the Atlantic to the Pacific Coast and their design and quality are of exceptionally high grade.

Lawsuit Settled

An action by the Ambursen Hydraulic Construction Company of Canada, Limited, Montreal, against the Dominion Paper Company, Quebec, has been settled by consent. The plaintiffs entered into a contract to construct a dam for a hydro-electric development on a 15 per cent. basis, but after two months' work were stopped, on the ground that the methods were too costly. The plaintiffs thereupon sued for breach of contract and for damages, and the defendants entered a counter-claim for a large amount. Under the settlement the Ambursen Company will receive \$16,000 for commission and an agreed sum for damages, the counter-claim being withdrawn.

Reducing the "Working" of Wood by Kiln-Drying

A great source of annoyance to all woodworkers and users is the tendency of the material to shrink and swell with changes in atmospheric conditions. This is due to the fact that wood substance is hygroscopic—that is, it attracts or absorbs moisture from the air. Increase in the moisture content of fairly dry wood causes it to swell, and drying out causes it to shrink. This property of wood can be reduced, but not entirely eliminated, by subjecting wood to boiling, steaming, prolonged soaking, or exposure to high temperature.

To determine just what effect kiln-drying has on the subsequent moisture condition of wood as compared with simple air-seasoning, a number of tests were conducted by the Forest Service in co-operation with the Yale Forest School. The test specimens were of two sizes, 2 x 2 x 6 inches and 2 x 1½ x 30 inches. Three sets of seven pieces each were taken for each of three species, and for each of the different temperatures used. One set was simply air-dried and used as a check (C) with which to compare the other two sets of that series. Another set (A) was first air-dried for about a year, then kiln-dried, and finally placed aside with the check specimens to air for a year or more. The third set (B) of the series was soaked from the green condition for the same length of time that the other sets were air-dried, was then kiln-dried with the second set and placed in the air with the others. The airing took place in the open under a shed on the north side of a building where they were protected from sun and rain. The comparative

tests were all made at the same time which adds to the reliability of the results.

A comparison of the water content of the pieces that were kiln-dried first with that of the pieces that were only air-dried showed that in no case did the kiln-dried material absorb as much moisture as the other.

For example, air-dried and water-soaked red oak blocks were kiln-dried at maximum temperatures of 145 deg., 170 deg., 212 deg., and 274 deg. They were then exposed to the air for a year or more and their average moisture content at the end of that time determined. The results were as follows: At 145 deg., previously air-dried (A), 7.6 per cent.; previously soaked (B), 9.6 per cent.; check specimen, air-dried only (C), 12.4 per cent. Similarly for the other temperatures the figures were: At 170 deg., (A) 10.6, (B) 10.6, (C) 12.4; at 212 deg., (A) 9.4, (B) 9.5, (C) 12.0; at 274 deg., (A) 8.9, (B) 9.9, (C) 12.6. From these figures, each of which is an average of seven tests, the reduction in hygroscopicity due to kiln-drying appears to be a permanent change by some fundamental change in the wood substance.

The degree of dryness attained, when strength is of prime importance, should not exceed that at which the wood is likely to remain in use, but where reduction of the hygroscopic properties of wood are of first consideration it should be carried to as great a degree as possible and subsequently brought back to the condition under which the wood is to be used by exposure to the air for some time before the lumber is manufactured.

St. Maurice Protective Association Had Successful Year

Montreal, December 17th (Special to the Canada Lumberman): The St. Maurice Forest Protective Association, Limited, continues to do splendid work in protecting from fire the limits of the firms who are members of the association. This is the only society of the kind in Eastern Canada, there being one other in the West.

The previous year was largely a period of organization. During the past season the association has been in working order and has proved of great value in preventing the destruction of very valuable limits. The area of just over 11,000 square miles, or 7,280,000 acres, is patrolled by 52 fire rangers and four inspectors. The territory is divided into divisions, each in charge of an inspector, and in turn the divisions are split up into districts.

During the past season there were 307 small fires, which were prevented from spreading owing to the vigilance of the staff. The season was a dry one, and it is certain that, had not the fires been discovered, much timber would have been destroyed. Eight look-out stations have been constructed, and these are connected by means of telephones. In addition 20 miles of telephone wires have been installed. The association has also built during the season 200 miles of new trail. The rangers patrol the right of way along the Transcontinental, five motor speeders being used for the purpose.

The Quebec Government have backed up the efforts of the association by financial assistance, Hon. Jules Allard, Minister of Lands and Forests, being a strong believer in the system of the association.

The officers are: Messrs. J. M. Dalton, Gres Falls Lumber Company, Three Rivers, president; S. L. Decarteriet, Quebec and St. Maurice Industrial Company, La Tuque, vice-president; L. Denyears, director of the Belgo-Canadian Pulp & Paper Company; R. F. Grant, St. Maurice Lumber Company, Three Rivers; F. I. Ritchie, Wayagamack Pulp & Paper Company, Three Rivers, and Ellwood Wilson, Laurentide Company, Grand Mere, directors; H. Sorgius, manager, Three Rivers.

The Pearl City Veneer Company, Jamestown, N.Y., report that business is keeping up very well for this time of year.

TO INSURE SATISFACTION—STATE WHERE BELT IS TO RUN

Alfred Dobell & Co's. Report

Alfred Dobell & Company, Liverpool, Eng., in their timber market report under date of Liverpool, December 1st, say:—There is little or no change noticeable in the market since our last report. Business throughout the month was quiet and although in the aggregate the consumption has exceeded the arrivals, stocks of several important articles are still much too heavy and values have a drooping tendency.

Canadian woods—waney board and square pine—The consumption has been restricted owing to the competition of the lower priced Siberian Pine. Oak—No change. Rock elm—The stock is light and prices very firm. Birch—Logs—The demand is quiet except for fresh St. John wood. Values steady. Planks—There was a moderate import and consumption. Stock is heavy. Pine deals and boards again came forward plentifully and met a fair demand. Stock ample. New Brunswick and Nova Scotia spruce deals—The import to the Mersey and Manchester combined was 280 Standards below that of the same period last year, the arrivals to Manchester being only 60 Standards for the month, which must be a record. The consumption was somewhat above the average, being 810 Standards up. Stock is still more than ample. Prices steady.

Quebec's Proposed River Tolls Act

The following is the text of the principal clause in the Bill introduced into the Quebec Legislature by the Government, relating to tolls for the floating of timber on rivers and water courses:—"The Minister of Public Works and Labour may order an investigation to establish the nature, value and cost of works so executed and constructed in rivers, lakes, ponds, creeks or streams to facilitate the floating of timber, or the tariff of tolls that should justly be established, to be made by any court, person or corporation he may indicate and which shall report to him."

Canadian Matchwood Wanted in South Africa

The safety match industry of South Africa imports annually from Russia about 6,000 tons of 40 cubic feet of the aspen log. Some years ago a sample lot of the same wood was secured from Canada and the wood proved of even more value than the Russian as match wood, but was discontinued because the price of the Canadian log at the time was much higher than the Russian. The cost price f.o.b. at the time of sample lot for the Canadian log was 22c per cubic foot, and the cost of Russian log was 16c per cubic foot, but as prices at the present time are higher in Russia, this would be an opportune time for the Canadian lumber trade to make an effort to secure this market. A match company at Cape Town state that they would prefer to buy from Canada and invite correspondence. They are prepared to handle 6,000 tons of 40 cu. ft. The logs must be not less than 9 inches in diameter up to 20 inches and of course must be as clear of knots as possible. As it is stipulated that the wood should arrive in a moist condition, the bark must remain on the logs, and when possible the end of the logs should be painted over. In addition to being clear of knots, each log must be seven feet long and perfectly straight. The market can be secured if Canadian dealers will lay this article down not more than 18c a cubic foot f.o.b. either St. John or Montreal.

Ireland Wants Canadian Spruce and Fir Seed

The land and forest department of Ireland desires seeds of spruce and fir as grown in British Columbia for planting in the Emerald Isle. Chief Forester McMillan has just received an enquiry from the board as to the possibility of purchasing several thousand dollars' worth of these seeds in British Columbia, for reforestation purposes in Ireland. The land and climate there is believed to approximate that of the coast of British Columbia, and the Irish board states that it is anxious to get trees which will grow as rapidly as do spruce and Douglas fir in British Columbia. The chief forester has referred the enquiry to the Indian department, as the Indians in many places make a practice of gathering such seeds. The Hudson's Bay Company, and all other concerns likely to have spruce and fir seeds will also be asked to assist the Irish board. It is a fact not generally known that Germany and France in their reforestation annually use huge quantities of seeds of British Columbia trees which they obtain from British Columbia seedsmen and Indians.

Samples of Douglas fir from British Columbia are to be submitted to experts of the Dominion Government at McGill University for the purpose of standardizing this timber for the commercial market. For some years yellow pine, the qualities of which are well known, has enjoyed a monopoly as a building material in the eastern provinces, but it is expected that when these proposed tests are completed Douglas fir will take a larger place in the British Columbia export trade.

Personal and General News Notes

The twelfth annual meeting of the Hardwood Manufacturers' Association of the United States, will be held at the Gayosa Hotel, Memphis, Tenn., on January 21-22, 1914.

F. S. Green, formerly with the Fernridge Lumber Company, New Westminster, B.C., as sales manager, has taken a position with the Canadian Puget Sound Lumber Company, Victoria, B.C.

Wood block paving, tried and discarded in many cities of the United States thirty years ago, is now coming back into marked favor, due to improved methods of treating and handling the blocks.

German foresters are experimenting with Douglas fir from the United States, trying to find a variety which will combine the fast-growing quality of the Pacific Coast form and the hardness of the Rocky Mountain form.

Hon. P. T. McGrath, who is a member of the Legislative Council in Newfoundland, was a visitor to Toronto recently. He reports business conditions in the island colony as prosperous and says that the pulp mills of Newfoundland, which are the greatest in the world, are very busy.

The 1913 output of the Cranbrook, B.C., district, totalled 147,000,000 feet of sawn timber, including 500,000 ties. In addition there is a total of 1,000,000 ties yet in the woods as well as 750,000 feet of telegraph and telephone poles, 350,000 feet of piling, 18,000 cords of mine props and 7,500 cords of fence posts.

Reports from Montreal state that there is no scarcity of labor for the lumber camps during the coming winter. There is a larger demand than usual, but on account of the plentiful supply, wages are lower than last year. From \$25 to \$30 per month is now the average as against \$30 to \$35 last year. The same report states that Polacks are largely supplanting French Canadians in this work.

Mr. Thomas N. Phillips, of Timms, Phillips & Company, Limited, Vancouver, B.C., wholesale dealers in Pacific Coast lumber products, is making a business trip through Eastern Canada and was a welcome visitor at the office of the Canada Lumberman recently. In spite of the fact that business conditions throughout Canada are very quiet at present, Mr. Phillips reports that he has been able to secure some very encouraging orders. He will remain in the east for another month.

An Interesting Harness and Equipment Catalogue

One of the most modern and up-to-date catalogues issued by any Canadian manufacturer has recently come to hand from the firm of Lamontagne, Limited, Montreal, manufacturers of harness, collars, horse blankets and in fact everything that pertains to the needs of the horse. This book is printed on the loose leaf system, with heavily coated paper and contains upwards of 300 pages, thoroughly illustrating everything in the line of harness and horse equipment required for the lumber trade. Lamontagne, Limited, have been in business in Montreal since 1869 and year by year they have extended their business throughout the country, until at the present time their goods are to be found in all centres from Vancouver to Sydney. Besides their factories and warerooms at Montreal they maintain branches both in Winnipeg, Man., and Vancouver, B.C., where a full line of goods are kept constantly on hand. They manufacture a line of goods especially adapted to the lumber trade needs and every lumber firm finds their catalogue of great assistance during the buying season. A copy of the catalogue will be sent to any firm on request.

Increased Grant for Quebec Forestry School

The Quebec Government propose to increase from \$5,000 to \$8,000, its grant to the Forestry School, which is affiliated with Laval University in Quebec. In return for the larger grant of funds the Laval authorities will give a longer course of studies. The number of lessons or lectures will be increased from 900 to 1200 for the year. The course in forestry is one of three years, and consists of instructions in the nature of different kinds of soil suitable for the growth of trees, the classification of timber, and elementary engineering. Last year's classes had forty pupils. Laval University is constructing a new wing at the cost of \$60,000 in which the Forestry School will be conducted.

W. T. Whitehead, ex-M.P.P., Fredericton, N.B., died recently at his home after a long illness. Mr. Whitehead was one of the best known men in the province and was specially conversant with values of timber lands in New Brunswick.

Linderman Universal Dovetailer

NOT only will the Linderman Automatic Dovetail Glue Jointer do the highest grade joint work possible in flat or straight joints but it can be used for almost any class of work desired in a furniture or general woodworking plant. The illustrations shown herewith are but a very few examples and in all cases economy in labor, glue and lumber stand out as permanent, positive benefits to the user.

EDGINGS

Ontario

The ratepayers of Chatham, Ont., have defeated a by-law for bonusing, to the extent of \$12,000, the Saginaw Match Company, Saginaw, Mich., which proposed to erect a factory at Chatham, Ont.

The Northern Veneer Company, Limited, Grimsby, Ont., which was recently incorporated with capital stock of \$200,000, reports that it intends to manufacture veneer for the basket business.

The pulp mill of the Dryden Timber & Power Company, Dryden, Ont., will be closed for about two months while the installation of new machinery is being made. About \$100,000 will be spent on improvements to the plant.

The Keewatin Lumber Company, Keewatin, Ont., report that their operations in the woods will be on the same scale this winter as last. During the sawing season of 1912 this company cut 31,000,000 feet of lumber and 7,500,000 lath.

West & Jackson, whose sawmill at Englehart, Ont., was destroyed by fire on June 10th have built a new mill and have now had it in operation long enough to cut the balance of the logs that were not destroyed by fire. Additions will be made to the mill next spring, so as to increase its capacity.

John Harrison & Sons Company, Limited, lumber manufacturers, Owen Sound, Ont., report that they contemplate making the following changes in their plant this winter; a new carriage for the double cutting band mill at their plant at Algoma Station on the Soo branch of the C. P. R.; a new double cutting band, also log chain, for east side mill at Owen Sound; new picket machinery for west side mill at Owen Sound. The company's operations in the woods this winter will probably exceed those of last winter by 25 per cent.

Tenders are being received until January 12th for the purchase of Ontario timber license No. 194, for 1913 and 1914, on berth No. 2, Township of Proudfoot, concessions 1-8, having an area of 23¾ square miles. The property is believed to contain between fifteen and twenty million feet of merchantable timber, mostly hardwood. The license at present belongs to the estate of The Beaver Lumber Company, Kearney, Ont. Further particulars may be had from F. C. Clarkson, Assignee, 15 Wellington St. W., Toronto.

Eastern Canada

Caron & Raymond, sash and door manufacturers, Montreal, P.Q., have dissolved.

P. Portugais & Company, wood turners, Quebec, P.Q., recently suffered loss by fire, their plant being partly destroyed.

The Edward Partington Pulp and Paper Company has filed notice that its capital stock has been increased from \$950,000 to \$5,000,000.

The Wood Mosaic Flooring Company, Limited, Montreal, P.Q., recently suffered loss by fire, as a result of which their plant was partly destroyed.

The Partington Pulp and Paper Company have considerably enlarged their plant at St. John, N.B., and are now completing a new warehouse and conveyor to carry the pulp from the mill to the warehouse.

La Compagnie J. A. Gauvin, Limitee has been incorporated with a capital of \$49,000, to carry on business as furniture manufacturers, etc., with head office at Beauport, Que. The provisional directors are J. A. Gauvin and J. H. Fortier, both of St. Joseph de Levis.

At the sale by auction of the assets of Ernest Boyer, door and sash manufacturer, Chapleau Street, Montreal, the seven lots of land and the sash and door factory were sold to Mr. George C. Goodfellow, who also purchased the other effects at 54 cents on the dollar, making the total price \$15,500.

The Canadian Last Block Company, Limited, has been incorporated with a capital of \$50,000, to carry on business as shoe last manufacturers, with head office at Montreal, Que. The provisional directors are O. Dufresne, Maisonneuve, E. Robin, L. P. Delongchamps, J. Ouimet, of Montreal, Que., and A. Martel, of Iberville, Que.

La Compagnie de la Riviere Kiamika, Limitee, has been incorporated with a capital of \$25,000, to carry on business as lumber merchants, with head office at Val Barrette, Que. The provisional directors are O. Girard, Mont Laurier, Que., H. A. Chevrier, Val Barrette, Que., N. Page, Nominique, Que., J. B. Lafleur, Mont Laurier, and F. Charbonneau, Kiamika, Que.

The Trois Pistoles Pulp and Lumber Company, River Trois Pistoles, P.Q., report that they are increasing their engine and boiler power, replacing several parts of their machinery with modern improvements, building conveyors to take their products from the mills to the yards by steam power and making other general improvements to their plant, which will increase their output.

The limits belonging to the estate H. M. Price & Company, which were offered at auction by A. F. C. Ross and E. Trudel, joint curators, on December 17th were not sold. The stringency of the money market is understood to have prevented any one from bidding as much as the up-set price. The limits were located on the River St. Jean, River Saumon, River Magpie and River Chambers. The up-set price was \$135,000.

The auction sale of timber limits on the River St. John, River Salmon and River Chambers in Quebec Province recently held by Messrs. Pentland, Stuart, Gravel and Thomson, resulted in the sale of the property to Mr. D. Breakey. The limits included: Limit No. A, River St. John, 28 square miles; limit No. B, River St. John, 40 square miles; limit No. 2, Salmon River, 41 square miles; limit No. 3, Salmon River, 74 square miles, and a limit on the Rivers Chambers and Salmon, 77 square miles.

The Grand Falls Company, Limited, will soon commence work on the erection of large pulp and paper mills at Grand Falls on the St. John River, N.B., where immense power can be developed, and where it is proposed to build up a very extensive industry. Sir William Van Horne is associated with the enterprise. Various companies have secured rights and powers at different times with a view to development such as is now proposed, but for one reason

or another nothing practical was accomplished. The present company has ample capital, and during the past year engineers have been at work upon its plans.

A report from Sherbrooke, P.Q., reports that the Chaudiere Lumber Company, owned by Messrs. McCrea and Tobin, has been sold to Mr. John Breakey, of Quebec. The property consists of about 15,000 acres of timber lands, one-third of which the company owned is fee simple, and two-thirds the cuts of timber only, also the improvements at Chaudiere. The price is understood to have been about \$350,000. In addition, the purchasers take over all contracts for timber to be cut this winter, reimbursing Messrs. McCrea and Tobin for advances made and expenses. The Chaudiere Lumber Company was organized about seven years ago for handling pulpwood and ties.

Western Canada

J. S. Deschamps, of Rossland, B.C., has recommenced operations with the China Creek Lumber Company.

The North American Lumber & Supply Company, Limited, has opened branches at Driver, Springwater and Dodsland, Sask.

The Western Cedar Pole Company, Limited, has been incorporated with a capital of \$50,000, with head office at Calgary, Alta.

The D. Morton Company, Limited, has been incorporated with a capital of \$20,000, to carry on the business of lumber merchants, sawmill operators, etc., with head office at Victoria, B.C.

The Federal Cedar Mill Company, Limited, has been incorporated, with a capital of \$20,000, to carry on business as timber merchants and sawmill owners, with head office at Vancouver, B.C.

William Curry who recently returned from Vancouver, B.C., has purchased an interest in the Continental Lumber Company of River Charlo, N.B., and will become the manager of that branch of the business from the first of the new year.

The Eau Claire & Bow River Lumber Company, First Avenue West, Calgary, Alta., are reported to be considering a plan for developing power to the extent of 1,500 kw. The cost of the development will be about \$300,000 and will probably involve the installation of 2 gas driven units and 2 turbo-generators. It is proposed to start work upon this development in the spring of 1914.

Canadian Wood Preserving Company, Limited, has been incorporated with a capital of \$10,000, to carry on business as manufacturers of railroad ties, bridge timbers, etc., with head office at Winnipeg, Man. The provisional directors are W. Buckler, consulting engineer, W. S. Harris, A. E. Larkin, Minneapolis, U.S.A., P. C. Reilly, Indianapolis, U.S.A., and J. A. Smith, Winnipeg, Man.

Plans are on foot to form a pulp and paper combination out of the Ocean Falls, Crown Paper, of Portland, and Quatsino Pulp concerns. Ocean Falls, owned by British capitalists, is now closed down. San Francisco capitalists propose to guarantee 50 per cent. of the Ocean Falls bonds and will put up \$3,000,000 for a paper plant. London shareholders having agreed, and I. Hamilton Benn, M.P., is on his way to San Francisco to execute the agreement.

Two hundred and thirty-two acres of timber on Craycroft Island were sold by tender on November 21st by the government to the Vancouver Timber & Trading Company for 75 cents a thousand, plus the royalty. The timber is principally hemlock, and must be cut in two years. Application was made for the purchase of this land, but the government inspected it and found, after the first payment had been made, that it was regarded as timber land, namely, that it carried over 8,000 feet to the acre. All brush will have to be disposed of by the timber company so that the land will be left suitable for agricultural purposes.

Forty million feet of timber within the area to be flooded by the Canada Western Power Company, when it raises the dam at the outlet of Stave Lake, B.C., has been purchased by Messrs. Loughheed and Abernethy with mills at Port Haney and Eburne, B.C. This timber is all close to the water and will be logged directly into the lake and brought to the Fraser river at Ruskin over the Canada Power Company's railway from the lake to the river, and from this point it will be boomed and floated to the mills. The timber is said to be of first quality, and forms an easy logging proposition. It became necessary for the power company to dispose of the timber as the area on which it stands will be deep under water within a few years when the plans for trebling the present power production are carried out. It will take four or five years to remove the timber.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing to the Department of Trade and Commerce and stating the number of the enquiry.

2240. Lumber, clear pine.—A South African importer asks for quotations on Canadian clear pine all sizes, planed four sides.

2241. Lumber, pine shelving.—Inquiry is made for quotations of Canadian pine shelving, quality 2, 1-inch x 12-inch by 12, 14 and 16 feet long.

2242. Lumber, poplar boards.—A South African importer asks for quotations on Canadian poplar boards $\frac{3}{8}$ -inch to 1-inch x 12, 14 and 16 feet long, planed four sides.

2259. Lumber and timber, all kinds.—A South African importer asks for quotations of all kinds of Canadian lumber and timber.

2268. Lumber.—Inquiry is made by a South African importer for quotations on poplar boards $\frac{1}{2}$ -inch and $\frac{3}{4}$ -inch planes, 12 to 16 feet long.

2269. Spruce deals.—An East London importer asks for quotations on Canadian 3-inch spruce deals.

2278. Carriage lumber.—A Durban firm asks, for quotations on Canadian poplar lumber planed on both sides to measure $\frac{1}{2}$, 5-6, $\frac{3}{4}$, $\frac{7}{8}$ x 12 to 15 inches wide and 14 to 16 feet long.

2321. Box shooks.—Quotations c.i.f. Durban are requested on different sizes box shooks.

There is Big Money Cutting Cordwood

The Features of Kent's Cordwood Splitter

- 1 Conveyor of logs to saw.
- 2 Steam hold down.
- 3 Cut-off saw.
- 4 Conveyor from saw to splitter.
- 5 Steam piston.
- 6 Steam head block.
- 7 Can be used as friction drive to carry wood out.
- 8 Vertical splitter.
- 9 Adjustable horizontal splitter.
- 10 Delivery table.

The new Kent Cordwood Splitter will turn small and rough timber, from which all logs suitable for lumber have been taken, into valuable cordwood. It will add millions of dollars to Canada's cut-over limits.

If you own or hold permits for any hardwood timber limits the Kent Cordwood Splitter can make big money for you. The machine is economical to operate and cheap to install.

The capacity of this invention has been demonstrated as 42 cords of 4 ft. cordwood per day of 10 hours with 11 men and one team. That means the timber cut, split and piled.

The cost of splitting hardwood has been reduced over 50 per cent. by this invention aside from the utilizing of timber that would be useless for any other purpose.

*This is an unusually interesting proposition—
we solicit your enquiries.*

Why Atkins Saws Run Faster

There is a real reason why Atkins **Sterling Cross-Cut Saws** will run easier and cut faster than any other Saw. This reason is because they are **Segment Ground**. This is an exclusive patented process which consists of grinding the Saws the same thickness along their entire tooth edge and gradually tapering them **throughout the entire blade toward the centre on the back**. See illustration in lower right hand corner.

ATKINS STERLING SAWS

will actually run with less set than any other because the blades clear themselves. There are other reasons why you should use them. Write to us at either address below and we'll tell you all about it. Better still—send us a small order and prove to your own satisfaction that Atkins Sterling Saws will make money for you.

E. C. Atkins & Company

THE
MAIN
DRIVE

has for many years proven its service giving qualities. It is equally reliable for all direct drives whether straight or crossed. It has a good surface for gripping the pulley, runs true and exceptionally straight. It will pay you to investigate this long lived dependable belt. Write for booklet—"The Main Drive."

Federal Engineering Co., Limited, TORONTO, MONTREAL

The Three Goodhue Belts

"EXTRA" "STANDARD" "ACME WATERPROOF"

These three brands are made for three different services and each brand is the best quality made from selected hides with the stretch taken out.

"Goodhue Belts" stretch less than any other belt by 15 to 25 per cent. This quality effects a great saving because it is unnecessary to be continually shortening the belt to keep it taut.

"Acme Waterproof" brand is made for the wet places in a mill and will give a remarkable service under the most trying conditions.

When you buy a belt—buy a Goodhue. Prices and particulars on request.

J. L. Goodhue Company Limited
DANVILLE - QUEBEC

GET 20 PER CENT. MORE LUMBER FROM YOUR LOGS

by using our

Patent Steel Band Mill and Carriage

Results from logs of given dimensions cut on Breeze, Denison & Co. pat. band mill.

Diam.	Log Length	Feet Lum.
8 in.	16 ft.	45
10	12	54
10	16	69
11	15	96
14	16	171

This result was attained by different users of our mills during the season of 1912. We can prove to your satisfaction that this mill will cut more lumber and superior lumber than any other Band or Circular Mill on the market.

Special features of Mill

Concrete foundation not necessary. Frame constructed with brace bolted to same timbers which support base of mill. This prevents any movement of mill foundation throwing mill arbors out of cross line. Supporting timbers attached to track which prevents variation in cutting of boards.

Roller Bearing Carriage

designed to do away with lost side motion which is quite necessary for successful work in double cutting bands.

Double Action Friction Set Works

working on thin steel disc, which can be successfully used in place of usual foot friction in receding knees. This cuts down weight in pinion shaft, therefore reducing momentum, so that it is beyond speed of setter to over set by rapid work. Carriage can be changed from high to low speed instantly and can be operated without passing saw more than six inches either way. Knee opening to 44 inches.

Guide prevents any binding motion to the gip and will automatically raise when coming in contact with knot in timber. Guides adjustable when mill is running.

A Canadian Built Mill of superior manufacture.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

• Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

December 20th, 1912.

Are your horses of use to you?

This seems an absurd question—and the answer is always
"Of course they are"—In which case provide your stables with:

Johnson's Reliable Veterinary Remedies

Johnson's Horse Liniment, No. 1 (Alcoholic)

1 gal. jugs (Imperial)	\$4.50 gal.
1 lb. bottles	8.00 doz.
2 lb. bottles	15.00 doz.

Johnson's Horse Liniment, No. 2 (an oil liniment)

1 gal. jugs (Imperial)	3.00 gal.
1 lb. bottles	6.00 doz.
2 lb. bottles	11.00 doz.

Johnson's Horse Colic Remedy

A sure and speedy cure for all kinds of Colic	
1 gal. jugs (Imperial) 40 doses	5.00 gal.
1 lb. bottles 4 doses	8.00 doz.
2 lb. bottles 8 doses	15.00 doz.

Johnson's Veterinary Healing Ointment (Gall Cure)

2 lb. tins	2.00 per tin
4 oz. tins	3.50 doz.

Johnson's Condition Powders (Concentrated)

1 lb. Packages	3.60 per doz.
----------------	---------------

Johnson's Camp and Household Remedies, such as Cough Syrup, Healing Ointment, Headache Powders, Big 4 Liniment, Stomach Bitters, Cathartic Pills, etc., etc., have stood the test of twenty-five years and are in use all over Canada, from the Atlantic to the Pacific. Prices are lower than those of all other manufacturers. Letter orders receive prompt attention.

A. H. Johnson, Wholesale Druggist, Collingwood, Ont.

Are Your Horses in Good Condition?

Horses for all lumber work are subjected to the hardest hauling under the most severe conditions. They should therefore be as fit as all possible care and attention can make them.

**In the Lumber Camp,
Around the Mill, In the Yard**

and wherever lumber has to be hauled the horses are always liable to a multitude of small injuries which if not attended to promptly may develop into lameness or disfigurement, thus reducing the working capacity of the horse and impairing its value from a sale standpoint.

You should always have handy and ready for use

Good Liniment

to reduce bruises, strains, soreness; allay pain and inflammation quickly, be an antiseptic dressing to a cut or burn, or to heal a wire cut, wound or laceration.

ABSORBINE

is an antiseptic healing preparation as well as a resolvent and a discutient. It will assist nature in bringing about a dissolution of the bunch, restore the circulation, gradually restoring the part to its normal condition.

It will produce permanent and complete results without blistering or removing the hair, and will leave no blemish. You can work the horse at the same time.

All enquiries on special cases answered without delay—full information and instruction on request. Absorbine \$2.00 per bottle at dealers or express prepaid. Manufactured only by

Elevating, Conveying and Transmission of all kinds a specialty

A silent drive proves the mechanical perfection of the **FAY-EGAN** "LIGHTNING" 336 Fast Feed Surfacer

Fay-Egan Surfacers are gear driven—not by crunching, rattling, power consuming and ever breaking gears with which you may have had some sad experience—but with large wide-faced gears, cut from the solid, with rolling contacts and perfect mesh, running in tight cases filled with grease.

The drive of a "336" is perfectly noiseless—the silence that proves mechanical perfection—the perfection that means great driving force with small power consumption and an entire absence of shut-downs and expense on account of broken gears.

This is but one of several reasons why Fay-Egan "Lightning" Surfacers and Matchers are proving so popular; and by the way we are equipping all late models of our machines with cut gears exclusively.

Once you know from actual experience the real value of cut gear drive you will have no other type on your Matchers and Surfacers.

You get cut gear drive now as regular equipment on Fay-Egan "Lightning" Surfacers and Matchers and Moulders.

Before you buy another machine of this type, investigate the new silent drives.

Book on Fast Feed Matchers and Surfacers Free on Request — Ask for No. 87.

You Are Deceiving Yourself If You're Using Ordinary Pipe Coverings

The mere fact that your steam pipes are covered doesn't necessarily mean that you have eliminated waste of steam by condensation. If you're using ordinary pipe covering you are still losing considerable steam—hundreds, perhaps thousands of dollars' worth annually.

Such an expenditure is a constant expense, as the very construction and composition of ordinary pipe coverings render maximum efficiency impossible. At their best they allow from one-quarter to one-half of the fuel consumed to become wasted by radiation and condensation. And in a comparatively short time they become absolutely worthless.

J-M ASBESTO-SPONGE FELTED PIPE COVERING

positively prevents this waste of steam. Its presence is a guarantee that every pound of fuel consumed is delivering the maximum quantity of steam. It carries steam a mile with practically no loss.

J-M Asbesto-Sponge Felted Pipe Covering is the most efficient covering on the market because it confines the greatest number of dead air cells. It is made of pure Asbestos Fibres and finely ground sponge. It is practically indestructible and retains its insulating value indefinitely.

It has been found in perfect condition after more than 15 years' service on underground pipes.

Take the first step toward steam-plant efficiency by writing our nearest Branch today for copy of interesting booklet.

Steam Press

THE American steam press is carefully designed and substantially built of steel. It is used for baling shavings, asbestos and many other materials.

The cylinder is 30" diameter by 45" high and the pressure maintained is from 60 to 100 lbs. according to the amount of material wanted in each bale.

Box

These are the Largest Veneer Knives Ever Made

as far as we know. They are 205 inches in length, and when compared to small knife in center which is a regular 24-inch Planer Knife, it will be seen how exceptionally large they are.

They are made of our special lock-weld steel which is absolutely guaranteed not to pull apart. Holes are drilled—not punched. This assures knife fitting machine without adjustment.

All Disston Machine Knives are evenly tempered, and ground to micrometer gauge.

We can fill any machine knife order you give us.

Send for the Disston Machine Knife Book. It is full of valuable information and is mailed free.

Cling-Surface Does It.

The belt in this photograph is 3-ply; it is transmitting 220 horse power; is under a tension of over 1445 pounds on the pulling side; and yet THE TOP SIDE RUNS SLACK.

When this belt was photographed (in the plant of the Wilkes-Barre Light Co., Wilkes-Barre, Pa.), it was pulling 220 horse power. Looks as though it were pulling nothing, doesn't it? Increase the load to 268 h.p., the rated capacity of the generator, or even higher, and it will act equally well—Makes no difference to a Cling-Surface-treated belt—the greater the load the further it lies down on the pulley and pulls, for it is the contact that counts. Treated with Cling-Surface a belt can't slip, especially if it is provided with a fairly liberal arc of pulley contact as above.

The belt isn't made the least bit sticky, but rendered pliable and slipless by the penetrating and lubricating action of Cling-Surface.

But coming back to the Wilkes-Barre plant above, the speed of the fly wheel is 240 r.p.m. and its diameter is 80 inches. The generator is 200 kw., 3-phase, 2300 volt, 60 cycle, and its pulley is 32 inches in diameter. Distance between centres, 24 ft. When the belt was new it was not treated for three months. It became oily and dirty and began slipping. Even the tightener would not prevent slip. Then Cling-Surface treatment began, and they write, "Followed Cling-Surface instructions on first application and since then gave an occasional application with brush. Result—no trouble whatever on account of belting." We have thousands of installations doing equally well.

Send your trial order now. We quote f.o.b. Toronto.

Catalogues furnished and prices quoted on application

The Steam Tension Band Mill

THE top guide on this mill, as well as the upper wheel, is operated by a steam cylinder.

This means that the guide can be moved up or down instantaneously, which in one day's work means quite a saving of time over the ordinary mill. This goes a long way towards paying for the mill by the end of a year.

But this is not all—with this steam operated guide it is just as easy to keep the guide close to the cut as it is to set it for certain size logs and keep it

there. This can be done without loss of time, and so by bringing the guide down close to the cut, vibration of the saw is done away with and the quality of the lumber is improved.

No form of tension yet devised is as easy on the saws as the steam tension—several of the users of this mill have run through an entire season without cracking a single saw.

These are some of the reasons why our steam tension band mill is the most economical mill to buy, and there are others which you will find in our catalogue.

When you are tuning up your mill this winter for next season's operations, remember that we can serve you promptly whatever your requirements may be.

A Be Sees of Values

**Population Regulates Demand,
Demand Regulates Price,
Price Regulates Profit.**

When forty acres of forest are converted into a field a source of timber supply is forever eliminated, and

A forever addition to demand takes its place.

Settlement, therefore, influences values in two ways: Lessening the supply and increasing the demand.

This country is being settled very rapidly and the result has been and will be steady and sure gains in timber values.

The Truck That Saves It's Cost Several Times Over in The Year

This truck is designed for lumber yards and planing mills and will be found invaluable for loading and unloading cars.

The front gearing is detachable and may be used with eight or twelve hind gearings. It is a double-header, nuts on axles being kept tight with Steel Cotter Keys.

Oil cups on the wheels and the fact that there is no resetting of tires saves any amount of trouble.

The old wooden-wheeled truck is a back number in comparison with this. It will pay you to write for our general catalogue which describes these trucks in detail, and pick out the style you want now.

Tudhope - Anderson Co., Limited
ORILLIA, ONT.

Not altogether what we say but what users say

“We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams.”

Will move a bag containing 60,000 logs,
in calm weather, 30,000 in a head wind.

West & Peachey - Simcoe, Ont.

Knight

Pony Lath Mill

This mill is built for use with a 10 to 15 horse power engine and as single mill only. It is specially suited to the requirements of thresher and saw mill men operating in small tracts of timber, as both husk and carriage are of a size which will permit of easy loading between the standards of a wagon when moving from one setting to another.

Write for the catalogue of the Knight line of saw mill machinery.

Size "S" Single Mill with 16-foot Carriage

Size Husk ... 3 feet by 6 feet 3 inches
Diameter and Length Mandrel ... 2 3/16 by 55 inches
Size Drive Pulley ... 20 by 10 inches
Feed per Revolution of Saw ... 0 to 3 1/4 inches
Feed Belt ... 4-inch Gandy
Largest Diameter Saw ... 56 inches
Length of Carriages ... 12, 16, 20 or 24 feet

Width of Carriages ... 33 inches
Trucks ... 7-inch wheels and 1 1/4-inch axles
Length Track ... 32, 40, 48 or 56 feet
Style and Opening of Blocks ... C1-36 inches
Style Mill Dogs ... Pony Excelsior
Style Set Works ... No. 1 Single Ratchet

With each complete size "S" mill we furnish one saw, wrench, cant hook, feed belt, pulley with boxes for tightener and foundation bolts for husk.

Our 70th Birthday Wish

A Successful and Prosperous New Year

THIS year we celebrate our 70th anniversary. It is now more than half a century since we commenced building machinery for the lumbermen of Canada, and in looking back over the long years we have spent together we are glad to remember the vicissitudes and the successes we have shared in common. The ups and downs—they are what have drawn us together—and we feel that it is to real friends we speak in extending the Season's Greetings to the Sawmill Men of Canada

The Waterous Engine Works Co., Ltd.

Midland Planing Mill Products

THE LEADING STOCK LINES IN ONTARIO

WE find that we can cut the labor cost of Sash in two, when we have the right kind of orders.

It is the single one of a size that costs a lot to make, and it isn't fair to the man who orders in quantity of each size to pay the same price as the man who buys in small lots.

Many Dealers in Builders' Supplies have heretofore refused to stock Sash for this very reason, and also because they did not have a reliable source of supply with good goods, reasonably prompt deliveries, and prices in proportion to the size of the order.

In addition to the regular trade discounts, we allow certain Discounts for Quantity, which are liberal almost beyond belief.

Complete information with prices and discounts will be found in our new Sash Book.

A copy is yours for the asking.

The McLennan Lumber Co.

Limited

Montreal, Canada

Our Double Band Mill, Huttig, Ark.

Why We Can Give "Value Received"

We Own one hundred thousand acres of the best virgin Southern Hardwood timber.

We Operate large band mills at Huttig, Ark., and Deering, Mo.

We Cut Forty Million feet of hardwoods annually and carry 15,000,000 feet in stock.

We Sell only stock cut on our own mills and so can **GUARANTEE** the quality of every shipment.

We Ship high grades that increase the size and percentage of your cuttings, reduce factory costs and shrink the waste pile. Therefore:

We Can save you money on every shipment of oak, ash, gum, elm, cypress, tupelo, hickory, cottonwood, sycamore, soft maple and dimension.

Let us prove this on your next order.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 16-ft. Slash table. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 2 Lath Trimming Saws. | |

POWER PLANT

- 1 24 x 36 Slide Valve Engine with 40-in. x 12-ft. extra heavy double arm split fly wheel.
- 2 Double Duplex, high pressure Water Pumps.
- 5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.
- 2 125 h.p. Water Wheels.
- 1 Upright Engine for sawdust conveyor.
- 1 10 h.p. Engine.
- 1 Mitts & Merrell Hog.
- 1 Wood Machine for 22-in. wood.
- 1 Wood Machine for 16-in. wood.
- 1 Edger for ripping dry lumber, installed.
- 1 Edger for ripping dry lumber, not installed.
- 1 30 h.p. Generator, 250 volt.
- 1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and rails and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

FILING ROOM

- 1 Automatic Filing Machine for 12-in. D.C. band saws.
- 1 Automatic Grinding Machine for 8-in. S.C. band saws.

Shimer Labor and Time-Saving Tools

Popular Matching Heads

Figs. 202 and 203 are the leading tools for matching Flooring, Ceiling, etc., for feeds up to 130 lineal feet per minute. They are made with four, six or eight Bits to each Head according to the machine to be used upon, material to be worked, and the rate of feed desired.

Fig. 202

Price, per set, with 4 Bits to each Head,....	\$40.95
" " " 6 " " " " " " " " " " " "	49.27
" " " 8 " " " " " " " " " " " "	57.60

Double Ceiling Heads

The Shimer Cutter Heads for matching Ceiling in double thickness to be re-sawed into two marketable strips, will double the capacity of any matcher or moulder.

These tools are very complete and are giving satisfaction in a large number of mills.

Price, per set, complete only 40.94

These tools are turned out of Solid Steel Forgings—have the Shimer "make-ready" which saves you all the fitting and trying—keep your work up to the standard.

The Truck That Saves It's Cost Several Times Over in The Year

This truck is designed for lumber yards and planing mills and will be found invaluable for loading and unloading cars.

The front gearing is detachable and may be used with eight or twelve hind gearings. It is a double-header, nuts on axles being kept tight with Steel Cotter Keys.

Oil cups on the wheels and the fact that there is no resetting of tires saves any amount of trouble.

The old wooden-wheeled truck is a back number in comparison with this. It will pay you to write for our general catalogue which describes these trucks in detail, and pick out the style you want now.

Don't Buy One of Our Steam Drag Saw Machines unless you want the best. The machine here shown has Positive Stroke; Friction Hoist; forged steel Connecting Rods and cast steel Crosshead. Is made in four sizes—from 26" to 54" stroke.

Write for Drag Saw Catalog fully describing this as well as other types.

ADAMS Towing Machine

The Adams Towing Machine when installed in one of our pointers will do the work of a steam tug.

The machine is a strong and reliable heavy duty gasoline engine of 6—8—10—12 or 16 horse-power, as required. It is equipped with a screw-gear winch or capstan 24 inches high from shaft to top of spool, and a reverse gear. The reverse gear is a convenience to disconnect the propeller so that all the power is used on the winch.

The Adams Pointer is planked with cypress with ribs, stems, keel rubbing and clamp streaks of white oak.

Adams Launch & Engine Co.

Penetang, Ontario

The Steam Tension Band Mill

THE top guide on this mill, as well as the upper wheel, is operated by a steam cylinder.

This means that the guide can be moved up or down instantaneously, which in one day's work means quite a saving of time over the ordinary mill. This goes a long way towards paying for the mill by the end of a year.

But this is not all—with this steam operated guide it is just as easy to keep the guide close to the cut as it is to set it for certain size logs and keep it

there. This can be done without loss of time, and so by bringing the guide down close to the cut, vibration of the saw is done away with and the quality of the lumber is improved.

No form of tension yet devised is as easy on the saws as the steam tension—several of the users of this mill have run through an entire season without cracking a single saw.

These are some of the reasons why our steam tension band mill is the most economical mill to buy, and there are others which you will find in our catalogue.

When you are tuning up your mill this winter for next season's operations, remember that we can serve you promptly whatever your requirements may be.

Toronto, January 15, 1914

No. 2

Freight Rates Readjustment Expected Soon

The recent conclusion of the taking of evidence in connection with an enquiry into western freight rates in Canada, leads to a hope that the Dominion Board of Railway Commissioners will soon announce their decision upon this important matter. It is believed that the judgment of the board will be announced by Chairman H. L. Drayton, K.C., shortly after the opening of Parliament. If this expectation is realized the Dominion Railway Board will have established a new record, having regard to the enormous mass of evidence to be reviewed and digested, the very laborious research involved, and the magnitude and complexity of the issue. It is known that the commission is making every effort to expedite the finding with a view to the early realization of such relief as may result to the western provinces, and with the secondary object of freeing the railway companies from the existing uncertainty, which is admittedly more or less detrimental to their interests. The commission is believed to be conducting its investigation on lines leading to a general readjustment and equalization of rates in western Canada, such readjustment to be, of course, based upon the evidence given at the hearings. This will affect all Canada west of the lakes, but the reductions involved will benefit chiefly the central prairie cities, such as Medicine Hat, Moose Jaw, Regina and Saskatoon, upon which the burden of discriminatory rates has fallen most heavily. Winnipeg and Calgary will also benefit, but to a lesser degree, while Vancouver stands to obtain a good deal.

This readjustment is expected to be the main feature of the coming judgment, but it is said that there may be more. The commission will, it is stated, order specific reductions on one or two of the heavy commodities most largely consumed by the farmers on the prairie and necessarily imported. Coal and lumber are mentioned. In regard to

them a direct reduction is a possibility, and there is also some idea that specific reductions may also be put into effect with respect to grain. These changes are predicted by men who have followed closely the freight rates enquiry since its resumption by Chairman Drayton and the present Railway Commission a little over a year ago, and who are in a position to know what is probably in the mind of the commission. A readjustment such as has been indicated would go far toward satisfying those who brought the question of alleged discriminatory rates before the commission. It would at the same time bear less heavily upon the railways than would a general cut on all commodities. The problem upon which the commission is called upon to pass has been complicated by the entry of two comparatively new transcontinental systems into the western field. The rates of the Canadian Pacific must be considered, together with the rates of the newer and less prosperous transcontinental lines, and the ability of these new lines to do business successfully upon an altered basis of earning from freight carriage in western Canada, has entered into the issue as an important factor.

The expectation of those concerned is that the Railway Commission contemplates such a readjustment as will meet some of the objections raised in the middle western centres from the burden of which they have complained, while at the same time guarding western Canadian communities against any curtailment of present transportation facilities through the inability of the weaker systems to withstand a radical reduction.

Square Dealing Brings Success

"We are not complaining at all, trade is alright for this time of year, so far as we are concerned," remarked a certain Ontario wholesaler recently, in conversation with the Canada Lumberman. "Of course we are not expecting to do a large business at this time of year, but, just the same, we are getting along nicely and we know of some others who are doing just as well." The slack business conditions which have prevailed during the last six months or more have been the subject of discussion in lumber offices almost every time the Canada Lumberman has visited any of them, and of late it has been very noticeable that the former feeling of uncertainty, as to the future, has given way to a fairly general conviction that the tide has changed and that trade conditions will show an improvement from now on. During this period of dull business, however, there have been a few firms which have reported, without exaggeration, that they have done a much better business than others. There must be a good reason for such a difference, and so far as can be judged from appearances and from the general remarks of the trade, the reasons are very definite and easy to find. In the case of the firm referred to above, the explanation is that they have built up a trade in Eastern Canada and in the United States which puts implicit faith in their business methods and which continues to come to them when the trade with other firms is curtailed or cut off entirely. When times are dull, every consumer, who has to reduce the quantity of his purchases, considers whom he shall drop from his list. Those who have given a square deal invariably will remain on the list to the very end. It may be that, during busy times, a square dealing firm sometimes loses business which it might have secured by different tactics, but the quantity of business thus lost is a small matter compared with the assurance of a steady and profitable trade when business with others is dragging.

Retailers' Contest—Who Will Win?

Every retailer who has a good plan or scheme for saving trouble, time, or money in his business, runs a good chance of winning one of the prizes we are offering for the best letter describing it. Read the conditions published on page 42, and let us hear from you. The contest closes on February 1st.

An instance of the way this works out in detail is afforded by the following facts. A certain customer, who had been using mill run birch for the manufacture of furniture, was approached a few years ago by a representative of the firm referred to above and solicited for an order. They had been using the good end in their factory and having a lot of trouble finding uses for the low ends.

"I know you handle a high class of birch," said the buyer, "but you have a reputation for charging high prices and we cannot afford to do business with you." The salesman had expected this reply and told the buyer that he was wasting a lot of money and time buying mill run stocks, etc. To make a long story short, the conversation resulted in a trial order and the next time the salesman called he was told that the stock was the best the firm had ever received and that they had unquestionably saved money and got far better results out of the better grades purchased in this way than they had formerly when they were doing their own buying direct and taking "mill run." Besides, they had no more low end to worry about. They became steady customers from that time on and their business with the firm now mounts into large figures every month, even when times are dull.

The same firm of wholesalers has frequently been able to step in where a large consuming firm has been buying the higher grades, but has not been able to get the inspection desired, without having an inspector of its own at the mill to watch the shipments, a thing which is very difficult and expensive to arrange. The wholesalers in question employ regular inspectors who are on the scene all the year round, wherever their shipments are being made. In this way they have built up a reputation by making sure that the grading is always what it is represented to be. Customers of a wholesale firm of this class will sometimes be tempted to do their own buying. They are frequently solicited to purchase direct, and they often do so on their own initiative. On the other hand, it quite frequently happens that such a consumer has so much faith in the methods of the wholesaler

that he prefers to continue doing business through him rather than make what appears to be a direct saving by going to the manufacturer himself. On both sides of the question there is much to be said, but the argument in favor of the reputable wholesaler is strong and is upheld by the willingness of many consumers to depend upon him for their supplies. Many cases may be cited where the buyer of a large consuming firm, dealing with the wholesalers already referred to above, has refused to deal direct, when finding that the stocks in question are handled by this wholesale firm. They find that, even at a higher price, they can save money by purchasing through wholesalers of this class, on account of the excellent inspection secured.

This instance, and many others, prove the value of the conscientious wholesaler to the trade. He is a man who relieves both ends—manufacturing and consuming—of the uncertainties of the selling and buying business. He becomes, not an unprofitable middleman, but a valuable protecting force, a man who assures the consumer that he will get the best stock available and the manufacturer that he will find steady customers. During time of anxious business, it is a refreshing experience to visit a wholesaler of this class and hear his pleasant discussion of trade conditions when some others are talking of nothing but depression. Just after the new year, when trade was naturally quiet, the Canada Lumberman called upon one of them and before he had been able to ask how business was going along, was greeted with the cheery remark, "well things are looking pretty fair for the first of the year, here is an order sent in by Bill (one of the travellers) for a little over a quarter of a million feet. Our sales for the first three days of the year were something over ten thousand dollars. Not bad eh?" No indeed, not bad, and the natural reflection is that there is a lot of good steady business to be had by those who go after it in the right way, even when others are complaining of dullness. One is reminded pleasantly of the "Brothers Cherryble," in whom Dickens has immortalized just the same type of business man.

Canadian and Siberian Pine

Attention has been called in these columns several times of late to the timber known as Siberian yellow pine, which comes from far eastern Siberia and which is quietly making its way in the markets of Great Britain. Canadians will be unwilling to admit that the equal of Canadian white pine can be found anywhere else in the world. The fact remains, however, that the high cost of Canadian white pine has led to minute search being made in many parts of the world for a substitute, and now, after years of search, a timber bearing all the earmarks of Canadian white pine is coming from Siberia and being accepted in Great Britain by many large consumers, who formerly would not touch anything but Canadian white pine, even though there was a great difference in price in favor of the substitutes. All former substitutes for Canadian white pine have been an inferior class of timber, of a quite different variety. Siberian pine, however, appears to have a splendid chance of becoming recognized as identical with the Canadian timber and therefore likely to be a most important competitor.

Under these conditions it is interesting to compare some of the circumstances attaching to the marketing of the two timbers in Great Britain. Canadian pine today, has an immense freight advantage over the rates of transportation for Siberian pine. The present average freight per standard of Canadian pine to Liverpool is about £2 2s 6d, as against £7 10s per standard for Siberian pine from Vladivostok. History is apparently repeating itself, and we see Siberian pine handicapped by a freight difference, at present, of about £5 7s 6d per standard. In spite of higher ocean freight rates, Canadian pine was able to come to the front, in face of the established position of Baltic woods. It remains to be seen whether the present movement of Siberian pine to Great Britain will survive the handicap of heavy freight rates which it has to carry and a well versed member of the Liverpool timber trade, writing on this subject in a recent issue of a timber journal remarks that it is in no wise a case of Siberian versus Canadian pine; it is rather that the former, on account

of its intrinsic merits now being widely recognized, is forcing itself into "a place in the sun." Many pine users have been found willing to give a trial to the new wood from Siberia, but only on condition that the price should be substantially lower than Canadian pine. The price of the latter has risen considerably of recent years, so much so that other substitutes—with not nearly such fine characteristics as the Siberian pine—have been used in lieu of the Canadian timber.

The distance from Vladivostok to Liverpool is about 12,000 miles—or half-way round the world—and the voyage lasts about 60 to 70 days. The freight on a fairly large steamer cargo is about £14,000, and the pine is not easily shipped save in cargo lots, so that the bringing of this new wood to this country is no small enterprise. On the other hand, the Canadian pine can be brought over in about 14 days, and in parcel lots. Besides this advantage, the Canadians thoroughly know the requirements of the British market and are careful to supply it only with what can be satisfactorily sold and used. The lengths of Quebec pine lumber run from 10 ft. to 16 ft. and rarely exceed 16 ft., whereas Siberian pine lumber is manufactured as long as 23 ft., and generally averages 18 ft. to 19 ft. long. Here in length the Siberian product holds an advantage over its Canadian sister, which advantage several large pine buyers have not been slow to realize. The latitudes of the Siberian and Canadian pine-growing districts are practically the same, though Vladivostok, the shipping port for most of the Siberian yellow pine, has a latitude of 43 deg. 7 ft. N., as compared with the latitude of Montreal, viz., 45 deg. 32 ft. N., and of Ottawa, 45 deg. 25 ft.

Canadian pine of course will continue to be used too, says the writer referred to above, and there is no reason why these timbers should not go hand in hand among the pine-using community, instead of the product of one country being spoken of as an opponent of the other. Each species has similar characteristics, and consumers welcome additional supplies, whether they be from Canadian or Siberian

sources. What a wood consumer will ask is, whether, after all, the Siberian variety is essentially the equivalent in its intrinsic characteristics, appearance, and usefulness to the Canadian pine, and that this is so many people who have tried the wood are convinced. The improvement in the manufacture and grading of each succeeding cargo of Siberian pine lumber has caused an increased demand on the part of large buyers, who previously only used Canadian pine, and effectively demonstrates that Siberian pine is now being successfully used. Probably the majority of the leading machine makers in England are now also using the Siberian pine, where formerly they were sticklers for Quebec pine, and Quebec pine only.

The above facts, which review the situation as it appears today, are of great importance to the Canadian pine export trade. They indicate the arrival of an entirely new factor in the trade of Great Britain. They also go a long way to prove that the demand for Canadian pine is so certain in Great Britain that even a costly journey half way round the world will not prevent the consumer from buying a timber which is apparently its equal. The course of a few years will show the truth or failure of this claim, but nothing can injure permanently the market for Canadian white pine in Great Britain—short of the discovery of much greater sources of supply than even those of Siberia.

Side Lines and Success in Retailing

A breezy and cheerful letter upon the retail lumber business and one or two of its important questions appears elsewhere in this issue, written by one of our subscribers, whose remarks have the double merit of being both brief and to the point. The writer, Mr. D. M. Heise of Stouffville, Ont., is one of those retailers whom the wholesaler or the manufacturer is always glad to call upon whether he gets business from him or not. He takes a rosy view of the trade situation and manages to secure a fair amount of business all the year around, whether others are doing so or not. Most of the time he is doing a large business and making a good profit. One needs only to read his letter to find some of the reasons for this enviable state of affairs. In the first place there is no doubt whatever about the class of business Mr. Heise is conducting. It is a retail lumber business, with several side lines which become necessary to a retail lumberman if he wishes to make the most of his opportunities. Lumber, lath, and shingles (wood) head the list of articles dealt in, as mentioned on Mr. Heise's letter paper. Then come steel shingles, asphalt roofing, lime, brick, plasterer's hair, hard wall plaster, verandah columns, drain tiles, etc. This is a natural assortment of side lines for a retail lumberman to handle and it is just such an assortment as has brought success to many a retailer. Mr. Heise's explanation of his reason for handling these side lines cover the whole business of side lines in a few brief sentences.

The retail lumberman who finds possible customers coming into his store and going out without buying, will naturally consider whether he should not stock the articles in request. If they happen to be articles which compete with lumber, lath or shingles, or which assist in selling them, the retail lumber dealer must stock them in order to protect himself. There is nothing else to it. Unless he does so, he will lose a certain amount of trade which would naturally seek

him under other conditions. Unless the retail lumberman makes side lines of such articles he will some day find a more wide awake merchant making a side line of lumber and getting away with a large share of his business. The question is not one of whether a retail lumberman should assist in selling articles which compete with wood, but whether he should keep custom in his own yard or store, when, by a reasonable amount of extension into side lines, he can do so conveniently.

Mr. Heise makes it very clear on his letter head that his principal articles are lumber, lath and wooden shingles. The other articles follow in the list and they all appeal to the man who is an extensive buyer of lumber and impress him with the fact that he can buy a wide assortment of the articles he needs at the one store or yard. Mr. Heise makes a remark which should appeal to other retailers as one which shows his good business sense. Talking of galvanized shingles he says:—"We do not claim that they are better than the wood, we must sell what the customers want, but at their own risk." This is the right way to look at the matter and if every other retailer of lumber, who handles side lines, would look at it in the same way, matters would be greatly simplified. Handling side lines can be made a profitable line of business for the retail lumberman in a great many cases, if it is conducted along such lines as these and there is no reason why, whenever the circumstances warrant, side lines should not to be handled. Perhaps the optimistic outlook upon trade conditions which characterizes Mr. Heise's letter may be partly explained by his methods. "We are thankful to say that our fall trade has been fine" he says, "The last season's trade in this district was the best around here for years. We have no spurts and stops in our trade. It is steady and solid." This is a fine story to be able to tell when others have been discussing the tight money and the financial depression.

Editorial Short Lengths for Busy Readers

The Dominion Labor Gazette for the month of December contains a table showing relative prices of various commodities, compared, by an index number, with the prices which prevailed during the decade from 1890 to 1899, the average price during this period being placed at 100. During November, 1913, the index number for lumber was 113.6. During October, 1913, the same price prevailed. During November, 1912, the index number was 109.8. These figures cover the average prices of fourteen different classes of lumber at various important Canadian markets.

From reports secured from correspondents of the Labor Gazette in various parts of Canada the following summary of trade conditions in connection with lumber during November, 1913, is compiled: The lumber trade was reported very quiet as compared with last year on account of the financial stringency and curtailment of building. Later, however, some improvement was reported. In Western Canada, especially Alberta, farmers were buying lumber as soon as the fall work was over. Mild weather in the East also permitted a continuation of building. A large business was predicted for next year if the financial situation improved. At Montreal better freight accommodation in freights to Great Britain was reported and shipments were being rushed before the close of navigation. Spruce deals were lower in New

Brunswick as stocks in Great Britain were heavy and there was no buying. The removal of the United States tariff was reported to have increased shipments only slightly as yet, but lumbermen expected a larger trade later. It was stated that there was no large supply of cheap lumber in Canada available for export. It was also reported that the demand for export might raise the prices of mill culls and medium grades. British Columbia shingles showed a tendency to advance 50 as the result of the opening of the American market. Pine strips and shorts declined \$2.00, but shipping culls and mill run were reported \$1.00 upward, while mill run spruce, hemlock and tamarac have been advancing.

Lumber manufacturers of Oregon and Washington have voiced vigorous protest against the announced intention of the Union Pacific Railway to construct all of its box cars of steel henceforth. At a meeting of the West Coast Lumber Manufacturers' Association a resolution was adopted and sent by telegraph to President Mohler, of the Union Pacific, urging the railroad to reconsider its action and thereby aid the railroad itself which draws a heavy traffic from the lumber industry of that section.

Hemlock Stocks About Half Normal

Manufacturers Report Conditions That Will Bring Good Prices if Trade Picks Up—Logging Conditions Unsatisfactory

A meeting of hemlock manufacturers of Ontario was held at the Queens Hotel, Toronto, on January 8th. Although the attendance was small, the meeting was one of the most interesting the hemlock men have ever held. Mr. W. W. Carter, of the Fesserton Timber Company, Toronto, occupied the chair and in opening the meeting said that at the present time all trade was quiet and the lumber business was no exception. Everybody seemed to be buying only what was actually required. The money stringency was having its effect on all lines of business. So far as hemlock was concerned he did not think that there was any large quantity of stocks on hand. There was probably not more than half as much stock on hand as there was a year ago. At present, prices were well maintained. His company had been getting \$20 per thousand on an eight cent freight rate. Hemlock had been meeting with severe competition on account of the heavy importation of yellow pine which was being sold very cheaply in Canadian markets. Most of this yellow pine was short leaf and about 90 per cent. of it, he believed, in fact nearly all of it, was blue moulded, and a great many of the large operators in the city would not use it at all because they claimed that its life in a building, once the blue mould appeared, would not be more than five or seven years. He thought that the competition of yellow pine would right itself in time, especially when the money stringency was over. Michigan hemlock was coming into Canada at low prices and getting into the markets as far east as London and Toronto. The money stringency was blamed for this situation also and he did not think that it would last very long. As to the quality of the Michigan hemlock, its grading was not the same as the grading of Ontario hemlock. The Michigan "merchantable" grade was, in fact, similar to the "merchantable" grade in eastern Canada.

Present indications in the woods were that the output this winter would not be large. A very low price was being offered for bark at present. At the best, he thought, the output would only be as large as it was last winter. If the present weather conditions continued they would probably only have about half as much as they had last winter. Mr. Carter discussed the relative values of yellow pine and Canadian hemlock, remarking that one very important feature must be borne in mind, namely, that the immediate cost of the yellow pine to the consumer was considerable. He had to put up money for a long freight haul, probably \$150 on a car. The small amount of the purchase price, representing the actual lumber itself, on which he got 2 per cent. off for cash at the due date of the bill, compared very unfavorably with the amount upon which he secured his discount if he bought Canadian hemlock. Moreover, when they purchased American lumber they were sending money out of the country and helping to make the money stringency in Canada. The thickness of the yellow pine and the Michigan hemlock should also be kept in mind. Practically all of the American hemlock and yellow pine 2 in. plank was only 1¾ in. thick, whereas the Canadian hemlock was 2 in. In buying Canadian stocks therefore, the consumer obtained a greater quantity of lumber for his money, and correspondingly greater value.

Mr. Carter also drew attention to the importance of maintaining the grading standard in connection with Canadian hemlock. They had established an excellent grading system which had helped their trade considerably and ought to be maintained rigidly.

Mr. Chas. McGibbon, Penetanguishene, Ont., stated that the hemlock situation in his opinion had improved of late. A short time ago it had looked as if United States hemlock and yellow pine were going to depress prices in Ontario. Taking into consideration the cost of production to-day there was not very much profit in the business and if prices tumbled there would be nothing. He believed that users of wood in Ontario had not been educated sufficiently to the advantages of Canadian products. He commended a pamphlet issued by the Northern Hemlock and Hardwood Manufacturers' Association, Wausau, Wis., which calls attention to the durability and adaptability of hemlock. He suggested that a pamphlet upon similar lines should be prepared and published by the Ontario Hemlock manufacturers and that copies should be sent out to architects, contractors, retail lumbermen, etc. He dwelt also upon the relative values of yellow pine and hemlock, claiming that the blue rot, to which yellow pine was subject, made it vastly inferior to hemlock and declaring that the users of wood in Canada should be awakened to this situation.

Mr. McGibbon believed that prices at present were at about their proper level. Operations in the woods would be as expensive this year as they had ever been before and he believed that prices must be maintained, if they were to secure any profit at all.

Several other members who were present took part in the discussion, their views being along very similar lines to those of Mr. Carter and Mr. McGibbon. It was decided to follow Mr. McGibbon's suggestion and arrange for the publication of a pamphlet promoting the use of hemlock.

Lumbermen Included in Honor List

Ottawa, Jan. 6, (Special to the Canada Lumberman). — Among the six Canadians who were included in the New Year's honor list it is interesting to note that four of them are either lumbermen or connected with the lumber industry. The four are: Henry Kelly Egan, of Ottawa, now Sir H. K. Egan; Mr. Aubrey White, Deputy Minister of Lands, Forests and Mines for Ontario, honored with C.M.G.; Sir Francis Langelier, Lieutenant - Governor of Quebec, who is given a K.C.M.G., and Hon. Lieut.-Col. Sir Douglas Cameron, Lieutenant-Governor of Manitoba, who is also honored with a K.C.M.G.

Sir Henry K. Egan is one of the best known lumbermen in Ottawa. He is managing-director of the Hawkesbury Lumber Company and also a director of the Bank of Ottawa, the British Canadian Bank Note Company, and the Ottawa and Montreal Power Transmission Company. He was born in Aylmer, Que., January 15, 1848, so that he will be 65 years old on the 15th of this month. He is connected with several prominent charitable institutions in Ottawa. Several times he has refused nomination for a seat in the House of Commons.

Sir Henry K. Egan, Ottawa

National Wholesalers to Meet at Buffalo

The next annual convention of the National Wholesale Lumber Dealers' Association will be held at Buffalo on Wednesday and Thursday, March 4th and 5th. The details of the convention are being arranged by Mr. E. F. Perry, secretary. The holding of the convention at Buffalo will be a matter of interest to Canadian members who now number some thirty or more. The hosts of the occasion will be the Buffalo Lumber Exchange, the officers of which are A. W. Kreinheder, president; John McLeod, vice-president; and John S. Tyler, secretary. The holding of the convention at Buffalo makes it of interest to recall the position which that city occupies in the lumber world of the United States. Receipts of lumber at Buffalo during 1912 totalled no less than 128,674,000 feet. Shingle receipts amounted to 614,295,000 pieces. Buffalo's main claim to importance from the lumberman's point of view, in addition to its extensive markets, is the fact that the port of Buffalo includes the entrance to the Erie Canal, which has recently been widened and deepened to admit boats with a maximum capacity of two thousand tons. This canal carries traffic through to New York City and provides, in conjunction with the Great Lakes, exceptionally favorable facilities for the carrying of lumber to the markets of the great eastern States. The cost of widening and deepening this canal has been approximately \$150,000,000. It is expected that the opening will be celebrated in 1915.

Reduces Rates on Import Pulp Wood

Ottawa, January 8th: Commissioner McLean, of the Dominion Board of Railway Commissioners, has issued a judgment dealing with the complaint of the Howell Company of Toronto in regard to the increase of railway rates on import pulp wood to various points on the C. P. R., C. N. R. and Grand Trunk, and the effect of the judgment is to reduce the rate per hundred pounds on shipments from Montreal to Windsor Mills from nine to eight cents, the same rate as applies to Shawinigan Falls. Commissioner McLean, in concluding his judgment, says: "Comparing the rates as charged with the rate of the local product and taking into consideration the mileage involved and the charges which have been borne at Montreal on the imported product, I am of the opinion that eight cents is a reasonable rate for the movement from Montreal to Windsor Mills."

Lumbering Operations Delayed

W. R. Smyth, M.P. for East Algoma, Ont., states that lumbering operations have been seriously delayed in northern Ontario owing to the lack of snow. The late fall and early winter were ideal for cutting the roads and getting the logs ready to take out, but the absence of snow right into January has held the work back and some of the men have been allowed to go. Other operators report that they have found labor very plentiful and that in many camps the maximum wage being paid since Christmas is one dollar per day and board.

Preparing for New York State Shingle Count Change

Since the adoption of the new shingle count regulation by the State of New York, several of the manufacturers of shingles in the State have been in touch with the State Sealer of Weights and Measures in connection with the new regulation in order that they may be in a position to observe its provisions fully when they become effective. As a result of the further consideration of the subject the following is a review of what the trade of the State are planning to do to meet the new regulations when they become effective February 1st next.

In the first place the regulation requires that shingles bundled other than 25 courses at each end of bundle be sold on comparative basis, thereto. That is, shingles bundled 25 courses at each end of bundle are to be computed as 250 shingles to bundle, and shingles bundled 23/24 courses are to be computed as 235 shingles to bundle, and such bundles must be stenciled 235 or a sales slip, ticket or tag shall accompany the bundle representing the count.

The 23/24 course shingles used in New York State are the White Cedars which come from Quebec and New Brunswick, where some 300 mills make them, and from these mills probably 90 per cent. of the three lowest grades, No. 1s, Extra No. 1s and Clear Whites are shipped to nearby consuming districts in Canada. The next better grade, Second Clears, is used in large and increasing proportion in the Canadian markets, and the greater quantity of the best grades, Clears and Extras, are sent to the New England States. In both New England and Eastern Canada this method of packing shingles, short count is the standard, and with the comparatively small proportion of output being shipped to New York State, none of the mills will change their method and put up 25/25 course bundles. It can readily be seen that to do so on certain grades and not on others would lead to endless confusion and trouble.

The argument has been presented by certain interests, that the consumer was being defrauded, by getting shingles 23/24 courses to bundle instead of 25/25, but it can easily be demonstrated that the consumer is getting full value for the price he pays for the 23/24 course shingles and that if the same shingles were packed 25/25 courses the consumer would have to pay a proportionately higher price to offset additional material, labor and freight costs. There is not nor should there be any "deception" in the sale of these short count shingles, for they are sold on their merits in competition with other shingles.

The only question is, the preference of the retail dealer for having the bundles marked with the figures 235, or for furnishing a ticket or tag with each lot of the shingles he sends out.

To this end quite a number of the manufacturers are enquiring as to the wishes of their customers in this matter regarding the method which will be preferable to the particular trade of each, it being understood that the manufacturers, where it is possible, can have the bundles stenciled 235, or, if preferred, leave off the figures so that the buyers may furnish ticket, or tag, or mark the bundles themselves.

Some manufacturers have also advised that after February 1 they will sell short count shingles on the basis of price for four bundles instead of making price per thousand, which will comply with the regulation.

Duration of Quebec Timber Leases

As a result of criticism of the Quebec Government's timber leasing policy, Mr. J. Hall Kelly, M.L.A., recently defended the government, saying that the leases were not to be considered perpetual. They were annual. The man coming into the province to invest money in lumber in these days did not become the sole owner of that lumber, but joint owner with the government. The government retained the right to change the rate of stumpage and the ground rent. In effect, the government said to the lumber holder: "We will allow you to take hold of a certain tract of land, provided you respect the regulations, pay the ground and stumpage dues, and observe any regulations that may be issued. You can take it for ten years. After that the license is renewable annually." This, said Mr. Kelly, could not be construed as giving the holder right of perpetual renewal. It could be cut off by the government in twenty-four hours after it had expired for the year. The land was not held in fee simple. In reply to the statement that surely a limit holder could insist on the renewal of his lease, Mr. Kelly repeated that the government had absolute right to cut it off, but admitted that it should exercise this right with discretion. He himself had had occasion to borrow money on limits obtained from the government, and he had always been asked, "What guarantee can you give that the government can not revoke your lease at the end of the year?" He always replied that he had no guarantee except the honesty of the government. As an instance of the power of the government, he pointed out that it could increase the ground rent or prohibit the exportation of pulp wood unless there was a mill in the province belonging to the company. At the same time he suggested that it would be a good idea if the length of time for which

a lease was given were twenty years or more—the average life of a bond. It would be much easier to interest capital in developing the limits, because there would be more security. He added that at present there are forty-one pulp and paper mills in the province, and that in a short time there will be more pulp and paper taken from the province of Quebec than from any other part of the North American continent.

A Record Flagstaff

The largest one-piece flagstaff in the British Empire was put into position recently in front of the new court house at Vancouver. The flagstaff is a product of the British Columbian forests, and is a flawless example of British Columbian timber. The pole is 213 feet high.

The tree was cut at Gordon Pash Lake, B.C., and presented to the Government of British Columbia. The tree, of course, was much longer than 213 feet. Its utility for flagpole purposes depended on having that length free from branches. As it grew in the forest it was as erect as a sergeant-major, in fact, very much more so. It was towed in a loog boom for two hundred miles to Vancouver, and drawn by night from the slip on False Creek along a straight road by a traction engine. In its finished state it weighs eleven tons. Before the carpenters had adzed and planed it into shape it weighed probably three tons more. Since last fall it has been seasoning and drying out to prevent its warping out of shape. Great care had to be taken in erecting the pole. A concrete foundation twelve feet deep was prepared to carry the weight. A derrick-pole nearly one hundred feet long had to be erected to lift it. At the first lift the centre came up and bent like a cane, but the ends of the pole refused to leave the ground until timber braces had been put round the pole and a martingale and wire stays adjusted to take the strain from the ends. After the necessary experiment had been made and the time came for the final lift, the signal was given to the engineer, and the donkey engine and winch slowly but unerringly lifted the pole from the ground and allowed the base to be swung into the concrete socket. The flagstaff is held in place by guy cables set in concrete beds at each corner of the court house lawn, and will stand for many decades as an example of what the forests of British Columbia can produce in the way of tall timber.

Our New Paper Market

There have recently been signed a number of contracts in New Zealand for newspaper to be shipped direct by boat from Canada. This will mean a great deal of additional shipping for Vancouver and will place the paper industry in general in this country on a much improved basis. Both the east and west coasts of New Zealand are using rapidly increasing quantities of print paper as well as other grades. There is every indication that British Columbia firms will be able to supply the bulk of the print paper to New Zealand and Australia. During the quarter ending September 30th, 1913, we shipped into New Zealand \$170,000 worth of news print together with some wrapping. In that country, we enjoy a preference of 20 per cent., which means that Canadian paper should practically control the market. Not only will this assist British Columbia mills, but it will take some of their production which has been coming east in competition with other Canadian mills, into other channels, thus relieving the pressure in the middle West.

New York Wholesalers Feeling Cheerful

Chase, Talbot & Company, New York, in their market letter under date of December 31st, say: The turning point has evidently been reached. Optimistic talk is freely indulged in, which of itself has long since been proven to be a fore-runner of fact. Corpses are strewn along our pathway, as a result of the fool-killer's activity, while his over-exertion has necessitated slumber in an obscure and unknown spot. Good cheer is the watch-word of the lumber trade to-day.

There have been some recent sales of eastern spruce, from which we quote as follows:—Random 3 x 7 and 3 x 8, \$25 to \$26; random 3 x 9, \$26 to \$27.50; random, 3 x 10, \$27.50 to \$29; random 2 in. ordinary schedules, \$22 to \$24; 2 x 8 and 2 x 10, \$25 to \$27; dimension specifications 8 in. and under, \$26; 9 in. and over, \$28; long leaf yellow pine merchantable, an average of about \$2 to \$3 per M. less than the price of eastern spruce; short leaf yellow pine an average of about \$4 to \$5 per M. less than long leaf; Eastern hemlock dimension, \$22 to \$23; Pacific coast Douglas fir timber, \$25 to \$26; spruce laths, \$4.00.

Abitibi Plant Making Good Progress

It is expected that the new 150-ton ground wood plant of the Abitibi Pulp and Paper Company, at Iroquois Falls, Ont., will be in operation by May next, and the machinery will begin arriving for installation early in the new year. A new hotel is being finished, which is thoroughly modern, and dwelling houses will be built for the married men. The company will have about three hundred men in the bush cutting pulp wood.

Talks With the Lumbermen of British Columbia

No. 5—By Douglas Fir

Of course we all know that supply and demand are the two dominating forces in the land to-day by which we are all governed to a greater or less extent. It seems to be one of the incontrovertible laws of nature that the thing which we want most is that which we cannot have in sufficient quantity to satisfy our needs, let them be imaginary or otherwise, except at extraordinary cost to us, and this law, administered under its present faulty interpretation, is the governing power which regulates our values to-day. A very forcible illustration of this is to be seen by those who have occasion to study the money market at the present time, and who can say that the conditions which have arisen in the last twelve months have not in a very large measure been brought about by the maladministration of the powers of this law?

I have before me a daily paper in which is an advertisement for a loan of \$5,000. The advertiser wants this money for a term of five years, and he offers to pay \$200 per month interest for the use of it, and of course pay back the principal at the expiration of the term. As this interest would under such strained conditions be taken in advance, this man does not receive \$5,000, but only \$4,800, as the \$200 is deducted for the first month's interest; thus he pays sixty monthly \$200 payments which make \$12,000, and if we compound these payments of interest monthly at the reasonable rate of 6 per cent. per annum we find that we have \$2,600 more, or \$14,600 in interest which this man is willing to pay for the use of \$4,800. This of course, even though it is not an isolated case, does not place a proper commercial value upon money, but only serves to illustrate to what lengths some men will go in a frenzied effort to stave off the evil day which is upon them. This man, let us hope is not a lumberman, but who knows? I believe there are lumbermen in this province who are paying just as high a rate of interest to-day as this man is willing to pay, but perhaps they do not realize it. They may not be paying half as much for their money, but they do not stop and figure out in a practical way, by the rule of applied logic, what is the commercial value of lumber. After all is said and done, lumber must have a value, and so it has, but we destroy that value ourselves by throwing away all our profits, and sometimes more than our profits, simply because we have not the ability or stamina to regulate the supply to the demand.

How To Discover The Selling Price

If we will figure out, by calculating minutely, and not by guess or conjecture, just what the various kinds of lumber cost when ready for shipment, then add to this the cost of shipping and a reasonable profit, we will arrive at the selling price. But how many do this? I know that most of us think we do, but are you sure that you have taken into consideration all the charges such as insurance, taxes, office expenses, supplies, depreciation, interest and discounts, with a proper allowance set aside for losses? If you have done this, then all you have to do is to add what is a fair and reasonable profit and you have the selling price. Have you done all this? If so have you maintained that price? If not, why not? In this figuring I have been dealing only with local sales. Obviously, where sales are made through agents, or brokers, an extra allowance must be made, but the question of how many commissions should be allowed on an order is a matter that should be considered more seriously than it is, as I think it is pretty generally admitted that there is room for reformation here. If some of our good friends will stop and figure this out carefully I think that they will find, perhaps to their surprise, that they have sold lumber as much as \$6 below actual value, and if they will figure this as interest, for it really amounts to the same thing, they will find that their rate is not much lower than that in the case instanced herein.

Of course we know that it is a natural propensity of some to look lightly upon discussion of this kind and say "that fellow does not know what he is talking about. Who would ever think of doing business without figuring these things out?" To such I will venture the assertion that if any twelve lumbermen in this province representing as many different concerns will undertake to supply the editor with figures as above described there will not be any three out of the twelve who will figure alike, or in the same way. This is no idle assertion, for I have talked with quite a number of mill men, and have compared figures with some, and I know whereof I speak. Now this is a state of affairs which should not exist, for there is no more important chapter in the whole book of knowledge pertaining to the business than this one of getting at the actual costs of what we produce, and the manager who overlooks it is like unto a shipmaster navigating

without his chart, and we all know how dangerous that would be. A man who does not know anything about navigation, and who does not understand the chart is not likely to be given charge of a ship. Neither should a man who does not know the lumber business undertake the management of one. Both are dangerous undertakings, and are likely to end disastrously.

Caution and Study Always Win

Let us take the case of Bill Jones and Tom Brown. They are each navigating a lumber business, and they have each one started out for a certain port called success. The waters are dangerous for navigating, and there are many rocks along the course, but Jones is an experienced navigator who understands his chart, and knows exactly where the dangerous places are. He of course sees to it that no leaks are caused in his ship. He watches his chart, and if he is in any doubt as to his latitude and longitude he slackens his speed and keeps an extra watch until the danger is past, and thus he makes a successful landing. Brown is not an experienced navigator, and he knows absolutely nothing about reading the chart. Therefore he does not know where the dangerous rocks are, but he plunges along, and bangs a leak into his ship here, and another one there, until, before he is half way along the voyage, he finds that his ship is taking water so fast that he abandons all hope of continuing the voyage, and is forced to beach her along the way. While he is waiting for the salvage crew to come to save what they can of the cargo he takes up his glasses and casts a longing look out over the horizon, and away in the distance he spies an object. It is Jones! Yes, there is no mistaking it, it is Jones! There was always something about Jones that was unmistakable—some mark of inferiority and in anything that he had to do with it could be seen, and even now it is plainly discernable about his ship. Yes, it is Jones. Confound him! He always seemed mediocre and slow, and never paid heed to any of our warnings, and if it had not been for my ship striking these rocks I could easily have left him so far behind that he never would have caught up. But fate was against me. I have listened attentively to all that the experienced captains had to say about the course I was taking, and I was led to believe that it was a safe one. Could they have been deceiving me? Anyway, here I am, and there goes Jones on safely past, and he is taking mighty good care that he does not hit the rocks which have stranded me. Just like Jones, he always was peculiar, but a fool for luck every time. . . . No Mr. Brown, you are wrong. Jones was not as much of a fool as you took him to be, and what you saw about him that seemed peculiar, and which you were not able to understand was his bump of capability to observe and understand the things about the business which you did not know, and upon which you placed little or no importance. Jones examined his own little ship, inferior though it may have seemed, very minutely, inspecting every part of it very carefully to see that there were no leaks anywhere, because these little leaks are the cause of many of our disasters, and some of them could have been so easily avoided! Yes, it does seem peculiar to see a man like Jones in the present day, and to the average manager he seems a rather narrow individual, but just the same, while many of us were standing out conspicuously and thought we were reviewing the great panoramic scene in a comprehensive way as it rolled out before our vision, I fear that some of us became so absorbed, or should I say bewildered with the magnanimity of our own comprehension that we forgot our chart completely, and we were bumping against rocks here and there, causing leaks and weaknesses which we had not discovered until we found our craft in shoal water and going with full speed ahead. It is now that we realize that something is wrong, but it is too late. Lord, what a calamity! And there's Jones, who never seemed endowed with startling comprehensiveness, sailing along in safety while we are on the rocks. Isn't it hell?

Bumping On The Rocks of Failure

Jones, Brown, et al. are engaged in the lumber business as manufacturers, and they, unlike their more fortunate brothers who are operating their own camps, have to go out into the open market for their logs. Brown has always, since his initiation into the mysteries, been a good listener, and a close observer of things pertaining to the industry generally, but the trouble has been that all his observations have been taken in a general way, and so focussed that he only views the scene in a panorama, leaving the details of the interests which he represents too much to fate, and then accuses fate of being against him. It has been the consensus of opinion amongst Brown's associates that the best logs that can be bought are the most profitable logs to use,

all of which is quite true, if the business we are getting demanded mostly high grade stock. Brown picks up the cue however, and instructs his office that in future nothing shall be purchased but high grade logs. Jones, who is catering to exactly the same trade as Brown, knows that this is a simple application of theory which will not work out in practice, so he sees to it that such logs are purchased for his operations as best suit his individual requirements. Thus Brown is buying only Nos. 1 and 2 logs, and paying from \$9 to as high as \$14, or \$15 for them, while Jones is using Nos. 2 and 3 logs, and filling exactly the same class of orders as Brown is handling. It is often said that you can get anything you want out of high grade logs, which is quite true, but is it right? Jones finds that by careful watching and handling he can pick considerable high grade lumber from low grade logs, and so he buys the cheaper log for general purposes, and only buys the more expensive logs when business demands it. Thus, while his logs are costing him about \$7.50 per thousand feet, Brown's are costing him about \$11.00. Brown, and others of his associates, who will use nothing but the best logs, create a demand for them, and as a consequence the price goes up \$1, \$2, \$3, and still they buy. They have bumped a rock. Next thing they discover is that there is a falling off in the demand for uppers, with its consequent weakening in price, and they are heavily stocked. They have bumped again. There seems to be considerable business continuing to come in however for lower grades, or dimension, and so, as in the past, they continue to fill these orders from their high grade logs, but now that trade for uppers is dead they are not so particular about picking out the clear. They have bumped again. Rush orders come in for dimension, and we rush them out of such logs. Bump we go again. Everybody

about the works is more or less careless about saving grades, because you know we cannot go wrong when cutting such logs as these, and getting more uppers out of them than the company is able to sell, for we have simply got the sales department buried. Bump again. The sales department is floundering under an abnormal load of uppers which has been piled upon it, and irregularities are occurring here which have been described in previous talks, and this is where we get the final bump that puts us out of business. Weakness in this department at the best of times, and when closely watched over by an experienced eye is an alarming symptom of approaching disaster, but when weakness is allowed to run unchecked, soon all kinds of complications set in and the end is known to be near. The astute buyer takes advantage of this weakness, and perhaps irregular sales are made and bad accounts are opened up; the privileges of the credit system are abused, and collections are either overlooked or forgotten. While Brown and his associates are demanding No. 1 logs and paying enhanced prices for them they are not only glutting the market with uppers, and thereby reducing the prices, but they are also leaving a surplus of lower grade logs upon the market and consequently making easy buying for Jones, who goes right on in the even tenor of his way. He is of course able to underbid on dimension business, because he is buying suitable logs for this business at \$3.50 to \$4.00 less than Brown has done, for in addition he studies to raise his grade, while Brown is lowering his. Jones is satisfied that it is not so much the volume of business handled that counts, as how it is handled. He may be a slower navigator than Brown, but he pulls through safely, and after all isn't that the main thing to be desired? (To be continued.)

Slash Burning Becoming More General

Western Experts Believe This Method of Destroying Logging Debris Will Become a Regular Part of the Operations—Observations of an Experienced Fire Warden

One of the most interesting addresses at the recent meeting of the Western Forestry and Conservation Association at Vancouver, B.C., was delivered by George C. Joy, Fire Warden of the Washington Forest Fire Association, who spoke upon the slash burning question. In part, Mr. Joy's address was as follows:

That the disposal of loggers' slashings by means of purposeful burning is the most practical, cheap and effective method, is the consensus of opinion of almost all of those loggers, timbermen, fire wardens and forest rangers who have to deal with this important phase of logging operations.

The necessity for the removal of this accumulation of inflammable material, annually, or if possible, semi-annually, is imperative and for two reasons, one of which is that the longer the burning is delayed the greater the hazard consequent upon the more extended area of land cut over where, when a fire does start, it is most difficult and often impossible to control, with the chances that a greater loss will result than if the burning be done more frequently with a less quantity of material to be consumed.

The other and more important reason is that it is impossible to keep fire out of these slashings long and I base this statement solely upon what observation and experience has taught me during the past twelve years in my work among the logging camps in Southwestern Washington. It has been my privilege to visit all of these camps most every summer and I have found one which has passed two successive seasons without a fire of considerable extent, and in most of them a fire occurred every year, which always resulted in more or less loss to the owner, besides often burning timber and other property.

Hence, my assertion that it is imperative that these slashings be disposed of by purposeful burning as often as possible, for they will burn sooner or later and when left for too long a season are liable to catch fire at a most inopportune moment when conditions are just right for a great conflagration. In the accomplishment of this work we should make sure that it is well done, for by so doing lessens the danger of another fire recurring there for several years to come.

This menace of fires on logged-off and burnt-over lands is increasing and will continue to do so, for every year more and more of the land is being denuded of its timber and unless the debris left from logging operations is pretty well consumed at the first burning, fire will run over it again and while the second fire may not burn so fiercely as the first, yet it has the chance of spreading over a wide area and will do so in a short space of time, requiring a long line of fire trail to control it, which is sometimes impossible. Such conditions prevailed in the vicinity of Pe Ell in Lewis County in 1911, where with seven or eight miles of trail we were unable to stop a fire on logged-off land, with the result that in the neighborhood of 75,000,000 feet of timber was burned.

There is little opposition amongst loggers at present, to the burning of their slashings, what there is comes principally from small operators who have forty, eighty or one hundred and sixty acres to log and who when they are through on these small tracts, move to some other locality and thus get away from the dangerous hazard they have created, leaving the responsibility of its disposal to others who are endangered by it. The large operator who is located where he is going to log for a term of years, knows full well from his experience that it is next to impossible for him to keep fire out of his slashings and so has adopted the best means at hand to rid himself of the increasing hazard by burning frequently and at times when there is little danger of his fire getting out from under his control.

In this matter of purposeful burning of loggers' slashings, the experience of the Washington Forest Fire Association during the past season has been such as to encourage us in the assumption that it is only a question of a short time when every logger who is operating on any considerable scale, will make this question a part of each season's program of operations the same as he lays his plans for any other part of the work.

Early in the season a circular letter was sent out to all logging companies urging them to do early burning of slashings wherever conditions would warrant. Our reports indicate that between 15,000 and 20,000 acres were burned, which greatly lessened the fire hazard during the summer.

In the latter part of August another letter was sent out on the same mission and offering the assistance of some of our men to supervise and aid in the work. The response to this was most gratifying and had the weather been as favorable as was experienced in September of last year, the large majority of loggers would have disposed of their slashings and I would be able to report a much greater acreage burned over than I am. With scarcely an instance did we meet with any objections to burning, the only difficulty standing in the way of getting this done, being that some operators were not prepared at the crucial time and were afraid to burn, for by doing so would have meant to run the risk of losing logs or camp equipment.

How to surmount this difficulty is a problem to the solving of which we must lend our best endeavors in order to bring about the desired unanimity of action on the part of loggers in preparing to do their burning when the right time comes in which a good burn can be secured, and unless a way can be found by which the slashing evil can be disposed of and at the same time eliminate the risk of burning logs or camp equipment, we will not attain to that degree of success in this line of work such as will insure the satisfactory safeguarding of property from this menace.

In the successful burning of a slashing more depends upon the time when this is done than upon any other one thing. No matter

what preparations are made for the burning it should not be attempted on a hot, windy day, for if this is done trouble is almost certain to ensue. In most instances the fires should not be started until after the wind has died down in the afternoon; then if you are prepared you can burn nearly any slashing with safety. As to where to set the first fire depends considerably on the direction of the wind, the topography of the ground and the location of property surrounding the slashing and which may be endangered by the fire.

Where a slashing lies on a side hill with timber on the slope above, the fires should be set along the upper side and allowed to burn away from the timber first before being started on the lower side, and, right here, I wish to make this suggestion to loggers who have slashings situated as I have just mentioned, that in case a fire gets started in

your works accidentally, and you are unable to control it, that you have some of your men fire the slashing along the edge of the timber, as this will prevent the fire from below going against the timber with such headway as to kill it. One such fire as this is responsible for the burning of ninety per cent. of the timber lost this year.

One cannot lay down any hard and fast rules governing the burning of slashing, for each slashing is a problem in itself, the successful burning of which largely depends upon the experience and good judgment of the one supervising the work. This should not be left to inexperienced men, for the hazard is too great. The necessity for cutting stubs can often be obviated by being able to choose the time for burning, but this can be done only where the operator has made preparations in advance so that he can burn any time.

Lumbermen Discuss B.C. Forest Service

Its Aims and Methods, Merits and Demerits Discussed at Vancouver Convention
—The Chief Forester's Defence of the Work

AT the annual meeting of the Western Forestry and Conservation Association held recently at Vancouver, B.C., one of the most interesting features on the programme was the series of addresses on the British Columbia Forestry System delivered by Mr. T. F. Paterson, of the Paterson Timber Company, Vancouver; Mr. Peter Lund, of the Crow's Nest Pass Lumber Company, Wardner, B.C., and Mr. H. R. MacMillan, Chief Forester for British Columbia. Mr. Paterson's address was as follows:

A few weeks ago the Forester of your association asked me to speak a few words along the line of the subject just announced by the chairman, and on looking into the matter I found that he had left to me a rather difficult task; and I have said just as little as I possibly could on the matter. I have with me a very short paper which may elicit some discussion by the members of the association as well as by the Forestry Department. The paper is got up with the idea to put the Forestry Department of the Province somewhat on the defensive; and Mr. MacMillan and his associates who are well able to take care of themselves, will doubtless perhaps criticise the paper somewhat severely it may be. But that was an understood thing that I be given carte blanche to say what I do, and to state what some of the Coast lumbermen's views are on the Forestry Department and also on conservation associations in general.

It is a somewhat difficult task to attempt a criticism of the policy and work of the Forestry Department, not yet two years old, in the Province of British Columbia. The province presents so many characteristics greatly different from many other countries which have long established forest policies, that some time covering a period of years must elapse before a settled policy, which will be satisfactory to a majority of the interests concerned, can be perfected.

There is a tendency on the part of the practical logger and lumber manufacturer to look askance at many of the methods put forward by conservation associations and forestry departments of governments, in the way of conserving the forests from fire or other kinds of destructive influences. It is argued, and in many cases with good reason, that many of the ideas promulgated along the lines of forest conservation, are those of theorists, and sometimes those of dangerous optimistic faddists. In many cases in associations such as this, theories as to how logging should be done so as to guard against fire and preserve the young forest trees which are left, are so impractical, when the subject is viewed from the stern viewpoint of finance, that it not only arouses righteous indignation in the minds of those who have to deal with the question from a practical standpoint, but makes him feel with the poet Pope that, "Fools rush in where angels fear to tread."

So far as the Province of British Columbia is concerned, the Forestry Department is sure to make experiments which will be found to work in theory, but not in practice; and conservation associations who imagine that all the methods adopted in other countries for the prevention of forest fires will work out in practice on the Coast of British Columbia will be disappointed. The Coast district of the Province is dissimilar to most other countries in three important particulars, namely: Climate, soil and physical features.

Owing to climatic conditions there are only four months of the year, May, June, July and August, in which there is any great need of precautions being taken to guard against forest fires. In the majority of seasons there are only three summer months in which there is any danger, and in a percentage, such as the year 1912, there was little or no danger from conflagrations on the Coast, owing to the rainfall throughout the summer months. It will thus be seen that the Forestry Department is called upon to provide a system which calls for a considerable staff, and which can only be profitably employed during the quarter or less of the year.

Owing to the gravelly nature of the soil on the heavily timbered areas of the Province, there is little fear of fire being kept alive for comparatively long periods. Fire, therefore, does not smolder for months only to spring up anew with the first high wind as is the case in many countries, where the forests grow on soil of a peaty nature. This is one of the principal reasons why there have been so few disastrous fires, as far as the destruction of green standing timber on the Coast is concerned. Most of the fires on the Coast occur on logged-over lands, and the writer has yet to see a case where a forest fire has done very serious damage to green healthy fir forests. There have been cases where lands covered with cedar timber have suffered, and in fir and hemlock which had been attacked by blight which had rotted the bark and sap. The great forest fires in the forests on the Coast of British Columbia originated in the minds of newspaper correspondents, whose grossly exaggerated statements as to the losses caused by fire in old slashings, have done a great deal towards depreciating the value of British Columbia limits in the minds of foreign investors. The writer has known many cases when the information supplied by deckhands on some of the boats plying between the Northern logging camps and the cities on the Coast has been the basis for lurid newspaper accounts of the enormous destruction of forest wealth, when in fact only some old slashing had burned on which the merchantable timber had been previously removed. In such cases sometimes serious loss occurs, to railroads, skid-roads running through logged-over land, or logging plants and down timber, but rarely to standing timber if in a healthy condition.

From information received from the Provincial Forestry Department, it seems a most elaborate system of forest fire prevention has been inaugurated. The Province has been divided into patrol districts with a district forester appointed to each. This official has, under the chief forester, full charge of his district, authorized to issue burning permits to settlers, hire patrolmen and fire guards, and make reports weekly or more often to the Department at Victoria. For the protection of the timbered area on the Coast, three large launches and eleven smaller ones are in operation during the summer months to convey men and fire-fighting apparatus from one district to another whenever the occasion requires. In the Interior and on the Coast a large amount of work has been done during the past years in the way of permanent improvements, such as the erection of telephone lines and the cutting of trails through the timbered areas. In all the sum of \$346,000 has been expended on forest fire protection by the Forestry Department, of which the Government pays half, and the other half was contributed at the rate of 1½ cents per acre from 8½ million acres held under special timber license, 1 million acres under timber lease, and 1½ million acres held under Crown grant. Considering the fact that the lumbermen contribute one-third of the revenue of the Province from rentals and royalty, it will be readily seen that they are shouldering the greater portion of the expense. It is a debatable question as to whether or not the Province is getting adequate returns for the money invested, even under the most careful management by the Forestry Department. From the instructions sent out by the chief forester to the various district foresters, it would seem that the department is making a special study of trying to get value for every dollar expended, and it largely depends on the integrity of the district foresters as to whether or not this is being done.

No serious complaints have been made by the lumbermen and public generally as to the extravagance on the part of the Forestry Department, as it is but new to the Province, and as yet but little interest is taken in the matter by the public in general. It is safe to venture the assertion, however, that even with the most careful measures adopted by the department, considerable money will be handed over in the form of what might be called political charity, to ap-

pointees who have to be rewarded in some way for political services to the members representing the district in which they are employed. When the writer is paying forest fire protection tax, he is reminded of the story of the Scotchman who, in contributing to the foreign missionary fund, enclosed a one-cent piece and a dollar bill with a note bearing the following instructions: "The cent is for the heathen and the dollar is to send it." Doubtless the waste in the Forestry Department will bear a closer relationship to the value received, but when everything possible has been done by those responsible to cut down expense to the minimum, there is bound to be a large expenditure for which no adequate returns can be received.

Re the permanent improvements such as roads, trails and telephone lines completed by the department last year, and on which \$150,000 was expended; different opinions are held as to whether or not much of this has not been an unwise expenditure. If there are to be trails cut up every valley along the Coast, and in cases on mountain sides and through limits which cannot be logged in the next twenty years, the cost is going to be enormous. Limits will be opened with trails which are in no danger from fire from mere inaccessibility to campers or hunters and the public generally. These trails in many cases will allow access to people who through carelessness may cause fires. Great discretion should be used by the department in cutting trails into limits containing small timber on mountain sides at high elevation. In one instance, according to the report of the department, a trail has been cut over the mountain range lying between Howe Sound and an arm of Sechlet Inlet. It is difficult for a lumberman to see why this should be done, or what practical use it can be in the way of fire protection. It is the opinion of lumbermen and loggers that, until a timber area on the Coast has become a fire risk from being in close proximity to logging or land-clearing operations, the less that is done in the way of cutting trails through it, the better. As to telephone lines, much money may be squandered on such projects if wisdom is not displayed, as to where they can be erected to do the most good.

There is another feature of the forest policy in which the department and the lumbermen are not as yet in accord. The special tax of 1½ cents per acre is taken from the latter; and they have as yet little or no say as to how it should be expended. Were it taken from the government treasury there could be no disagreement as to the department's authority to spend it as they saw fit.

It seems to be the consensus of opinion among the taxed, that there should be a committee appointed by the timber, logging and lumber manufacturing interests, to confer with the Forestry Department as to how and where the money collected for forest protection should be spent.

It is thought by many, that more co-operation should exist between the department and those engaged in the logging industry, in the way of employing men who work in the different camps on the Coast for the purpose of fighting fires. It has been suggested that the superintendent or foreman of each camp should be made a member of the forestry staff, with power to take the men employed under him and use them in fighting fire and such work, to be paid out of the forestry fire fund. The entire logging camps of the Province would be well covered, and many fires put out in the early stages which might become serious, before the district fire ranger could reach the spot with sufficient men to cope with it. This is a phase of the question which will bear considerable discussion, and if such an arrangement as the above can be made, it would do away with a large expenditure by dispensing with the majority of the Forest Department staff, who have to be kept whether or not there is work for them to do. If it is imperative that a considerable staff should be kept the writer would suggest they be employed certain portions of the year burning over old workings which have been abandoned. By doing this it would put the land in good condition for a volunteer crop of hemlock, spruce or balsam.

However, as time elapses, arrangements can be made whereby co-operation between the Forestry Department and lumber interests can be carried to such a point, that the greatest efficiency can be obtained from the forest fire staff with the minimum of cost.

I just offer these few suggestions, Mr. Chairman, and before saying anything further along that line I would just like to say a few words in general about conservation associations—present company is always excepted. We have had at times in this country—some associations—known as conservation associations which at times seemed to be dominated to some extent by mere theorists, who I believe go so far as to try to make us believe that we should conserve the whole forest for all time to come, and try to get some material to take the place of wood. Now there has come to my notice during the last two or three days a copy of a paper which we in the Dominion of Canada know well and which is entitled "Conservation." It is a monthly bulletin published by the Commission on Conservation in Ottawa, and would you believe it, Mr. Chairman, that with the November number the authorities who are getting up the paper or the editor, has gone conservation mad, we might say. In sending out this number of

"Conservation" he has enclosed with it a lurid picture of the terrible effects of putting a shingle roof on houses. This is carried all through the Dominion of Canada and would lead us to believe that they are so terribly in earnest in conserving the forests of this Province that they will go so far as to advertise along with their paper an advertisement from a firm who has a kind of patent roofing and this firm is showing the general public the terrible danger of using cedar shingles. Now, Mr. Chairman, I would say that if that is not conservation run mad I do not know what you would call it. When a lumberman, who has to come up against the extension of his markets in all parts of the world and is asked from time to time to give financial and moral support to conservation associations, as we have in this case from time to time been asked to support this association, I may say that it almost makes my blood boil to think that we have in this paper used as a medium to circulate an advertisement for an opposition firm in trying to do away with shingles as a roofing proposition. Now I may say as far as the general public is concerned in the Province of British Columbia, we have not thoroughly awakened to conservation, as conserving the forests here to any great extent is left mostly to the Government and the lumbermen and the Forestry Department. We are young in the business but I believe that our Forestry Department will improve as years go on. One of the points I notice in the report of the Forestry Department is that there has been a large expenditure in what is known as the Okanagan District of the Province, in the way of cutting trails and roads through timber areas there. I do not know whether these are of value or not. It would seem that we are called upon to provide a large expenditure in order to conserve some forests up in the Okanagan so that the water supply for irrigation there may be conserved. I hardly think that this is in line with what the department's policy should be. If these people are going to have their water conserved for irrigation purposes they should be willing to pay part of the costs. My time is up, gentlemen, and I have only thrown out these suggestions in order that there may be discussion. A great many of the lumbermen are in accord with the sentiments of my paper, and there are others who are not in accord and it will bear considerable discussion. It was for that purpose it was written, and if you wish to jump on me with spiked shoes I am here to take whatever is handed out to me.

Mountain Lumbermen's View

Peter Lund of the Crows Nest Pass Lumber Company of Wardner, B.C., in presenting the attitude of the lumbermen in the Mountain District on this subject, spoke in part as follows:

I feel very keenly personally on the matter—on any matter that borders on the question of conservation, and it is therefore that I finally consented to respond. There has been so much said here and so many other papers read on the forest fire question, the experiences and knowledge gained by a number of very able and intelligent young men, that it is really unnecessary for me to elaborate on these questions. Therefore what few remarks I have to make must be along the lines of generalities, and I want to ask your pardon if I depart for a few brief moments from the usual procedure of hard-headed business methods and take up what may be termed a sentimental or emotional side of the question.

I have been delegated by my associates and friends in the mountains of British Columbia to say something at this conference, the programme of which I notice is headed "A Forest Fire Conference." Further down the headlines, I notice the word "conservation."

To prevent the destruction of our forests by fire, we must admit, is very important indeed, but had this conference been called exclusively to discuss forest fire problems, it might be looked upon as more or less of a selfish measure on the part of those engaged in the manufacture and sale of lumber and timber products, the owners of standing timber and our different administrative bodies or governments, especially that of the province of British Columbia which does now and intends in the future to derive from its forests tremendous pecuniary benefits.

The word "conservation" having been inserted in the headlines of the programme, undoubtedly shows that the promoters of this organization were men capable of deeper thought, broader vision and higher ideals than would accrue from any pecuniary motives.

In dealing with the forest fire problem the first thing to do is to acquire and establish means of preventing forest fires from being started, which is largely a question of administration, organization, efficiency and application, in connection with which the question of costs will enter as an important factor. At this stage, therefore, it becomes a mathematical problem from a material standpoint in order that the end may justify the means.

The organization of a forestry department in this province and its development has been watched by all lumbermen in the interior with considerable interest, and I can say that the results achieved have been most gratifying to us. Of especial value has been the enormous development of the fire fighting force maintained, on whose work Mr. McMillan will no doubt give us some statistics.

Regarding the proposed legislation of increased royalties in

British Columbia. I cannot quite agree with the views held by the Honorable W. R. Ross as expressed in his speech of February 10th, 1913. Mr. Ross states that "statistics show that the average price for lumber in Canada to 1909 had risen faster than in the case of any other group of commodities except furs, and we all know there has been considerable increase in the three years since then." It might be interesting to review these statistics to which Mr. Ross refers, since our company has been in business for a good many years and I have yet to find any increase in the net prices of lumber that were not prompted by increased cost of logging or milling.

I feel strongly that the government of any country should adjust its taxation according to the ability of industries and citizens to meet such payments. I know that the honorable minister has perhaps changed his views somewhat, since his trip through the mountains during last Fall has no doubt proved to him conclusively that operations are not profitable to investors.

We in the mountains feel that the average stand obtained does not at all compare with the heavy stand obtained at the Coast, and that the ground rentals charged in the interior are too high when compared with the Coast district. I feel that about one-half the amount charged to the Coast would be fair in the interior. This argument has been advanced several times that mountain mills being more closely situated to the prairie market hold the advantage over Coast mills. This however, has never benefited any of the mountain operators since vast importations of lumber from the United States and Manitoba and Saskatchewan mills as well as the Coast, have been the sole factors of determining prices for our product. On the other hand we have never been the sole factors of determining prices for our product. On the other hand we have never been able, and no doubt never will be able, to share in the lucrative export business carried on by Coast Mills for their higher grades of lumber and marketing their common grades in the prairie market in competition with mountain mills, whose sole output, practically, consists of lower grades. I feel that the large revenue derived from the lumber industry in royalties and rentals has been far in excess of any revenue derived by the government from any other industry. Thousands of men are being employed constantly by this industry, and any adverse legislation would be a very serious matter for the province. This point was never more truly illustrated than during the past year, when so many of our mills have been closed down and great numbers of men are unemployed and are leaving the province to seek work elsewhere.

The legislation affecting lumber royalties has not as yet been decided upon so that it is to be hoped the government will see the justice of our contentions and prepare a bill which will be equitable and fair to all interests and that interior lumbermen will be sufficiently reimbursed for their many disadvantages.

The table of royalties and taxation received from the lumber industry for thirteen years ending 1912, clearly indicates the vast amounts derived by the government from this industry, and more than ten times pays for the expenses incurred for the administration of the forestry branch of the department of lands. During that period royalties alone have increased, I believe, over five hundred per cent.; the increase in 1912 over the previous year, if I am correctly informed, being about fifteen per cent.

The Government's View

Mr. H. R. MacMillan, Chief Forester of the British Columbia Government at Victoria, B.C., delivered a masterly defence of the attitude of the Government in its Forest Policy. Mr. MacMillan spoke as follows:

Mr. MacMillan's Paper

After listening to the addresses of Mr. Paterson and Mr. Lund which dealt with the manner in which conservation and fire protection is carried on in British Columbia and especially the great need for this important work, I feel that the only thing that I can do is to state our problem in order that you, and especially those of you who are lumbermen in British Columbia, may see it as we see it—see it right—and co-operate with us in directing the administration from year to year. Our first problem is that we have 250,000,000 acres here in British Columbia of forest land—practically all forest land. We have a small population of about 200,000 outside of the cities and towns, scattered through this area. This forest land is our greatest Provincial asset. We have this to protect with a fund of about \$350,000 which is equally provided by the lumbermen and the Government, the theory being that co-operation in the ownership of the timber calls for a division in the expense and responsibility of protecting. We know that the timber is exposed to danger from fire. I cannot agree with Mr. Paterson when he says that the Coast timber will not burn. I would only have to take you up the Coast to his old logging operations to show that it will burn. Every camp of his on the Coast is surrounded by fire-killed timber. There are other operations here on the Coast where there are large areas of fire-killed timber. There is not only the timber itself to protect, but scattered through the timber are hundreds of thousands of dollars' worth of logging equipment, some of which is burned up every year. This is in itself a reason why pro-

tection must be maintained at any cost. I cannot believe that Mr. Paterson's ideas as to the origin of forest fires being chiefly in the minds of newspaper correspondents could be derived from his having acted at one time as editor of one of the Vancouver papers. In undertaking this big job of fire protection which I think is one of the most difficult jobs in North America, we have fortunately not had to depend on our own experience. If we had to go on with no further assistance than our own intelligence and initiative we should probably have tried to put in practice theories which would not work out, but we had only to look around and see the example of other governments, and last but not least of the men who comprise this association, the members of which are probably the greatest experts in forest protection in the world—men who experiment with their own money and their own timber; and no man can keep that up unless he is an expert. The experience which they have given us—and they have given it generously—has been that fire protection depends on legislation to successfully prevent fires. It is better to educate the public to prevent and extinguish small fires and to put your country in such shape that when you meet a bad fire season you can get your organization to the fire before it is too big. As your Forester has well said, one man can put out 100 small fires easier than 100 men can put out one big fire. We have legislation which controls the setting of fires by a permit system. This is a great protection—the greatest one we have here in British Columbia. This legislation requires that every man who sets a fire shall get a permit from a member of the Forestry Branch. Our legislation also protects against fires from railroads. There are probably not many people here who know that there are now under construction in British Columbia 1800 miles of railroad. If it were not for the legislation which gives us the power to put men on to prevent fires and charge the expense to the railroad there would not be much timber left on the land opened up by the railroads. The second part of our general policy after the legislation is the patrol. We find it necessary to patrol practically the whole settled area of the Province. I will admit that a large number of these patrol men are not on the timber licenses. If you will consider this, as the country lies the timber licenses are practically on the greatest fire hazard. If we control the fire hazard properly the timber is safe. In a good many cases that is successfully done. The construction of general improvements has been referred to. We spend between a year and a year and a half in the study of a general situation before we undertake any improvements. These improvements are rendered necessary by the character of the country. They are located chiefly with the idea of increasing the efficiency of the patrol. Secondly, to enable us to mobilize our force readily and cut down the general expense, such as look-out stations, etc. Before this audience I need hardly argue the benefit and wisdom of constructing permanent improvements for fire protection purposes.

I wish to return to our general policy which is that the fire protection is carried on by the Forestry Branch first by legislation which will so far as possible reduce and control forest fires; and secondly by a patrol which so far as money will go, covers all fire hazards. Third, that we accumulate from year to year—in a favorable weather year—funds which will be spent as wisely as possible to make our forestry department more useful in after years. Mr. Paterson mentioned the construction of permanent improvements in the irrigation district. That was considered very carefully before action was taken. There are timber licenses in that district and the timber is of great value. The work was taken up and done in connection with the municipalities. It was done in this way to protect the fire protection fund in which the lumbermen share. I believe that this policy is acceptable because we have had co-operation—effective co-operation and assistance—not only from individuals but from municipalities and most of all we have had assistance and advice from lumbermen. In a large proportion of the work we have done up to date we have had not only financial assistance from lumbermen but applications for such work and have been strongly advised by the owners of the timber that if we could see our way to carry on these improvements after having considered the whole programme which must be undertaken that they would be very glad to have us do it. In any case, however, I can assure Mr. Paterson that where the timber man is afraid of putting a trail through, if he will take a chance we will take it.

A general criticism has been that if we are not careful in the administration and supervision of our work and not careful in our payments we will waste money. That is true of any organization. One thing to be said is that we do not spend a dollar under cover. Every one of our patrol men is visible to the community. Every bit of our work can be readily seen and inspected. The operators in most cases know what we are doing, where we do our work, how we supervise it and what it costs us.

I want to say that in any case any man who has an interest in the fire protection and who believes that he can assist us by talking to us, advising us and in this way improve the efficiency of our work, or believes it has not been done right, if he will come and tell us so we will appreciate his assistance.

Larger Sales of U.S. National Timber

Annual Report of Forester Shows Increase in Quantity Disposed of and Amount Cut—Interesting Details of the Year's Work

MUCH interesting information is contained in the annual report of the United States Forester, Henry S. Graves. The report calls attention to a substantial increase in the amount and value of timber cut from the national forests, and a still greater increase in the amount and value of timber sold, largely for future cutting. The gain in timber actually cut was 15 per cent. over the preceding fiscal year; in sale receipts, 27 per cent.; and in amount of timber sold, 167 per cent. In 1913 the total sales amounted to more than two billion board feet with a stumpage value of nearly \$4,500,000, as against less than 800,000,000 board feet with a stumpage value of \$1,600,000 in 1912.

The increased sales were made up partly of relatively small contracts for local use, but many large contracts were let for inaccessible areas whose product will be marketed in the principal consuming regions of the United States. Twelve large contracts were approved for an aggregate total of 1,552,398,000 board feet. The most important of these was a sale of 800,000,000 feet on the Sierra national forest, California, consummated after two years spent in estimates and negotiations. This sale well illustrates the policy pursued in developing inaccessible forest districts. Approximately 70 miles of railroad must be constructed into the Sierra forest, together with a complete mill and logging plant. Twenty-two years are allowed for the removal of the stumpage, with provision for readjustment of the price at intervals of five years. Sales under similar terms were approved for 345,000,000 feet on two other national forests.

The main causes of increase in timber sales were: The partial recovery of the lumber market from the depression of 1909-11; the policy of making large sales which has encouraged substantial companies to seek locations in national forests; and the general stimulus to business in the west, due to prospective transportation by the Panama Canal.

Idaho White Pine First in Demand

First in demand is the white pine timber of northern Idaho, now widely used to supplement the white pine forests of the Lake States. Second only to this white pine is the demand for sugar pine in California and for the western yellow pine in California and eastern Oregon and Washington. The demand for Douglas fir on the northern Pacific coast has been less active on account of the enormous amount of private stumpage. There are, however, increased sales in western Oregon and Washington. The demand for western red cedar throughout the northwest generally is very active, both for poles and for shingle stock.

After discussing the aims of the forest service in making sales the report says that it has been urged that the government should, through low stumpage rates, force timber upon the market and thus reduce the price of manufactured lumber. The present policy, however, can not be changed without a change in the law. No such change is called for, says Mr. Graves. Sacrifice prices, unwarranted by actual market conditions, would reduce the returns to the public and to the states, but they would not reduce the price of manufactured lumber to the consumer. In the United States 99½ per cent. of the timber cut comes from private lands. Competition in production is exceedingly keen. The mill capacity of the country is considerably greater than its normal consumption of lumber. This creates a constant tendency to produce more lumber than the market will take. During a period of depression actual overproduction appears. Stock on hand mounts up; price concessions to attract purchasers fail to bring the hoped-for acceleration of sales, and as returns fall below the cost of production curtailment is forced. From 1909 to 1911 many sawmills operated at an actual loss because carrying charges on their indebtedness would not permit them to close down. One hundred and thirty mills in the two leading lumber-producing states were altogether idle in 1909. So long as competitive conditions obtain among manufacturers the lowering of national forest stumpage rates would neither benefit the consumer nor appreciably affect the supply of lumber on the market. One-half of 1 per cent. of the total cut is too small a fraction to have any influence on prices; and although this fraction might be made several times as great as it is by offering government timber at a merely nominal charge, the effect would be simply to throw money away to procure the cutting of public timber in place of private.

Close Utilization Provided For

Problems concerning the most effective utilization of national forest timber are being studied. Such are the reduction of waste through closer manufacture and the production of distillates or other by-products, the extracting of naval stores as an accessory to lumbering, the use of inferior lumber species for the manufacture of paper, and the promotion of new or more valuable uses for particular species

through preservative treatment. One of the most significant of the recent developments in national forest sales is the demand for various western species for the manufacture of pulp and paper. The forest products laboratory has demonstrated, through experimental runs of pulp and paper and tests of news print in actual use, that many western conifers are well adapted for the manufacture of news print and other standard grades of paper. These are particularly the red fir of California, the Engelmann spruce and lodge-pole pine of the Rocky Mountains and northwestern states, and the Sitka spruce and western hemlock of the northern Pacific coast and Alaskan forests.

Exceedingly valuable and practical results have also been obtained through demonstration of the desirability of telephone poles cut from the lodgepole pine and treated with preservatives at the butt. The supply of western red cedar, hitherto the standard pole timber of the west, has become greatly diminished. In consequence, market prices are high, particularly in the Rocky Mountain region, where the cost of long freight hauls must be added to the first cost of the timber. It has been shown that lodgepole pine poles are stronger than cedar poles of the same dimensions and, with preservative treatment, considerably more durable.

Needs for Future Work

The increasing volume of timber sales carries with it increasing costs to estimate the timber, to transact the sale, and to supervise the cutting operations. During the year timber cruising was extended over 3,867,627 acres of national forests. This work involves an estimate of the standing timber, the most practicable methods of exploitation, the extent and character of young growth, and other matters which affect management. A total of 17,512,342 acres of national forest land, or about one-eighth of the timber area, has now been cruised.

Calendars and Souvenirs

Hobart & Company, dealers in hardwoods and North Carolina pine, 53 State Street, Boston, Mass., have sent to their friends in the trade an attractive leather bill fold and change purse which is sure to be a welcome souvenir and a useful trade promoter in the company's interests.

Hoffman Bros. Company, Fort Wayne, Ind., have sent out an interesting little calendar for the year 1914. A series of half-tone reproductions, showing the exterior and interiors of their plant, make up the decoration of the calendar and give an excellent idea of the capacity and equipment.

An attractive calendar for the year 1914 has been sent out by the J. B. Snowball Company, Limited, Chatham, N.B., to their friends in the trade. A number of logging, manufacturing and shipping scenes are reproduced from photographs upon the calendar. Each of the scenes represents an important stage in the lumbering operations of the J. B. Snowball Company, Limited.

A calendar which will be very welcome to lumber offices, on account of the splendid colored picture of the "Burling Scene" has been sent out by Mickle, Dymont & Son, Barrie, Ont. The calendar is a large one, well suited for office purposes and shows the quarters of the moon. The picture represents two men on a large floating log enjoying themselves to the full at the sport of revolving the log and still keeping their balance.

A splendid large calendar for the year 1914 has been sent out by Geo. Gordon & Company, Limited, Cache Bay, Ont. A fine colored picture entitled "Glories of Life's Eventide" is shown above the calendar, and the pad is a large and very useful one, being especially adapted for office purposes. It shows the quarters of the moon and contains on each sheet, not only a large calendar for the current month, but a small one for the months immediately preceding and following.

The Fred S. Morse Lumber Company, Springfield, Mass., have again sent out a calendar for the new year, along the distinctive and unique lines which they have adopted in previous years. The calendar consists of a separate sheet for each month, printed upon handsome buff tinted paper and surmounted by a little group of maxims for each month. The printing of the calendar is extremely attractive and the colors, brown, green and buff, are delightful to the eye. This calendar is sure to be given a distinct place in every office which is fortunate enough to receive a copy.

The Hocken Lumber Company, Limited, Otter Lake Station, Ont., manufacturers of hemlock, have sent out a very attractive calendar for the year 1914. The date pad is printed in large type and contains information regarding the quarters of the moon, and religious and other holidays. An attractive colored picture representing a scene in the woods is used to decorate the calendar. The picture shows a group of men seated around a small fire, while behind them is a sleigh-load of logs and in the background a bit of woods with the moonlight showing through the tree tops.

Great Results from a Modest Beginning

Story of the Growth of Wm. Rutherford & Sons Company, Limited, and The Dominion Box and Package Company, Limited, Montreal—Their Systematic Business Methods

Thomas J. Rutherford, President.

LIKE many lumber firms, the William Rutherford & Sons Company, Limited, Montreal, had a very modest beginning. The business was started in 1856 by the late William Rutherford, father of the present officers of the company, at the corner of Dorchester and Drummond Streets, and was afterwards removed to Point St. Charles, and from there to Chatham Street. Finally, it was moved to its present location on Atwater Avenue, occupying two blocks bounded by Notre Dame Street, Atwater Avenue and Levis Street, and extending back to the Lachine Canal banks. Each year has seen a little more building done or a little more space used to keep up with the ever increasing volume of business.

The company are the owners of

the largest combined business of wholesale and retail lumber, planing and saw mill, and interior finish in Eastern Canada. It may fairly be claimed that the name of Rutherford is synonymous with "lumber and millwork," and the work of the firm can be seen in most of the principal office buildings, schools, churches, theatres, and apartment houses in Montreal.

The following are a few of the interior finish contracts recently carried out by the firm:—Ritz Carlton Hotel, New Windsor Station, C. P. R.; New Place Viger Station; Linton Apartments; Strathern School; Evans Court Apartments; Sohmer Building; Sauvegarde Building; Royal Trust Building; Reed Building; Imperial Theatre, and St. Andrews Church.

Of late years, to keep pace with the rapid growth of Montreal, special attention has been paid to builders' supplies and stock millwork for immediate delivery. This service has been a boon to the speculative builder, who can never wait for his goods to be made up, and to whom quick delivery means money. The extent of the trade may be gauged by the fact that the company carry in stock about 20,000 hardwood and softwood doors, in addition to heavy stocks of window frames, sash, cupboards, cabinets, stairwork, posts, columns, mouldings, beaver board, roofing, tar and sheathing papers, etc.—in fact, every requisite for this line of commerce. They are agents and representatives in Eastern Canada for the Paine Lumber Company of Oshkosh, Wis., makers of the well-known Korelock Hardwood and Klimax Softwood Doors.

The yards, planing mill and the general interior finish factory cover a very large area. This main building is 3 storeys high and well lighted in every portion. Two elevators render the handling of

Andrew Rutherford, Vice-President.

Wm. Rutherford, Sec.-Treas.

material a mere detail. The plant is laid out for the economical manufacture of all kinds of wood products. The total force employed is some 500 men, of which 100 are joiners. The factory is equipped with a sprinkler system throughout.

The kiln for drying the lumber is located near to the lumber piles and a little distance from the main factory. It is in two sections:—In the first, free steam is circulated through the lumber to extract any acid which otherwise would stay in the lumber, if it were only subjected to dry heat. After remaining in the free steam kiln for some hours, the trucks are run out on rails (which traverse the entire double section) into the section, where ordinary dry heat is circulated.

From the kiln the lumber is distributed to the moulding and planing mill or sash and door department. That which is not required is sent to a storage shed where it is culled, sorted and racked. The mill is equipped with all the most modern woodworking machinery, such as band saws, matchers, surface planers, dimension planers, rip saws, and boring machines. Air lifts facilitate the easy handling of dimension timbers which have to be machined, and also enable the timbers to be loaded on to rigs for delivery or put through to other departments for further operations.

Lay Out of Main Building

The ground floor of the main building comprises the planing mill and moulding departments, where numerous high speed machines are kept continually running. The first and second floors are laid out for the economical manufacture of goods and in such a way that handling of the raw and finished product is reduced to a minimum.

On the second floor, is located the glue room and press room,

Stewart F. Rutherford, Director.

E. Dickson.

L. W. Halliday.

Wm. Dube, Superintendent.

The Wm. Rutherford & Sons Co., Ltd., Montreal, Charlevoix St. store shed.

for the manufacture of veneered work. The stair building department is also on this floor, completely equipped with modern machines run by dynamos. Here all parts necessary for the complete manufacture of stairs are made ready to erect on the job.

Adjoining the stair department is the paint and finish shop, where such goods as require it are treated. The factory has two very efficient blower systems, one for shavings and the other for sawdust. Part of the shavings goes to feed the boilers and part is baled by a baling machine and sold to the stock yards and to farmers for bedding for cattle, etc. The sawdust is conveyed to a separate bin, from which it falls down to the ground floor, where it is bagged and sold, there being a good demand for this product.

The boiler house contains five boilers, and the engine is 250 h.p., supplied by Laurie Engine Company, Montreal. There is also a small electric plant for illuminating purposes and for running a portion of the machinery. When repairs are necessary to the boilers, temporary dynamos are installed and the plant is operated as usual. An air compressor supplies the air for the lifts and also for cleaning the factory.

The machinery in this plant has been supplied by the following firms:—H. B. Smith & Company, Smithville, N.J.; The Berlin Machine Works, Hamilton, Ont.; S. A. Woods Company, Boston, U.S.A.; Connell & Dengler, Rochester, N.Y.; McGregor, Gourlay Company, Galt, Ont.; E. B. Hayes, Wisconsin; Greenlee Bros., Rockford, Ill.; Robinson & Son, Rochdale, England.

The raw products and lumber come in by barge and by Grand Trunk and Canadian Pacific Railway, sidings of these two lines running into the yards, so that the loading and unloading facilities are unexcelled.

The company always have on hand large quantities of hardwood for manufacturing purposes, in addition to the ordinary grades of lumber, of which millions of feet are continually stocked.

The Wm. Rutherford & Sons Co., Ltd., Montreal, Atwater Ave. store shed.

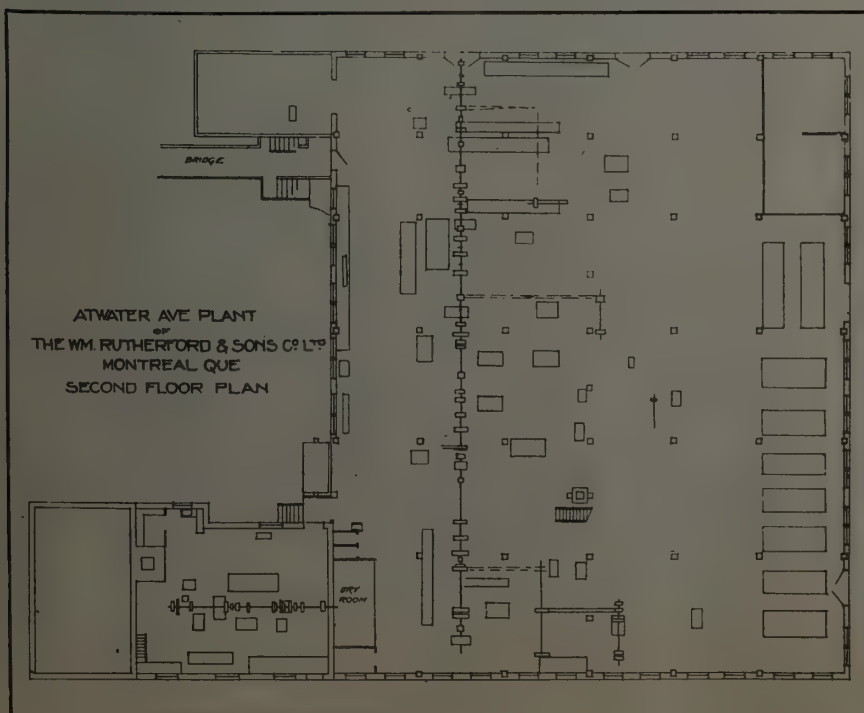

The stock millwork and builders' supply business is kept separate from the manufacturing end of the business, and is located in a large two-storey warehouse on the opposite side of the road from the main plant. This immense warehouse is about 100 ft. x 300 ft., and the ground floor is used for storing prepared hardwood, dressed lumber and mouldings, while the upper floor is stocked with thousands of doors in a variety of designs and woods, cupboards, stairwork, windows, etc., for immediate sale and delivery. Reserve stocks are carried in another huge warehouse, located on the Lachine Canal bank and Levis Street.

The company's stables where about 50 horses are housed, are located about one block away from the plant. In addition to the horses, three "Albion" motor trucks are used. Trucks were first employed about two years ago, the company being the first lumber firm in Montreal to invest in this mode of traction. These trucks have proved both durable and economical and it is probable that they will to a large extent replace horse haulage in the very near future.

The company also operate their own blacksmith shop, build and repair their rigs and auto trucks and make all repairs and extensions to the plant.

Two branch yards are operated, one at Outremont, and the other at Mile End, in the north end of the city, adjacent to the Canadian Northern Railway's Model City.

The officers of the company are as follows:—Mr. Thos. J. Rutherford, president; Mr. Wm. Rutherford, secretary-treasurer; Mr. Andrew Rutherford, vice-president; and Mr. Stewart F. Rutherford, director. The wholesale and retail lumber department is under the direct supervision of Mr. Thos. J. Rutherford, with Mr. E. Dickson as assistant, while the interior finish, millwork specialties and general factory is under the supervision of Mr. Andrew Rutherford, with Mr. L. W. Halliday as assistant, and Mr. Wm. Rutherford as secretary.

Plant of the Dominion Box & Package Company, Montreal.

treasurer, looking after the financial department. Mr. Wm. Dube, the superintendent, has been employed by the company for 23 years, from stairbuilder to his present position. Mr. Oscar Dube, brother of the superintendent, is assistant foreman, and has been with the firm for 16 years.

Mr. Thos. J. Rutherford is a native of Montreal, where he was born in 1858. He commenced his business career with his father in 1874, and afterwards became a partner in the William Rutherford Company (now known as the William Rutherford & Sons Company, Limited). Mr. Rutherford is a life governor of the Montreal General and Western Hospitals, a member of several friendly societies, and Royal Arcanum. He is generally conceded to be an authority on all matters pertaining to lumber.

Mr. Andrew Rutherford also commenced his business career with his father, in 1881, being later taken into partnership and has served in all practical positions in the company from apprentice and successively as foreman and superintendent. He is a member of several friendly societies, and a life governor of the General and Western Hospitals.

Mr. William Rutherford is also a native of Montreal, and was born in 1864. In 1892 he joined his father's firm, and a short time later was taken into partnership. Mr. Rutherford has taken an active part in local affairs, particularly in commercial societies and the civic life of Westmount. For many years he was alderman and in 1911 was Mayor of that city. He is a member of the executive committee of the Canadian Manufacturers' Association, and also represents the lumber and millwork interests on the Builders' Exchange. He is a governor of the General and Western Hospitals, and Protestant Hospital for the Insane, Verdun, besides being a member of the St. Andrew's and Caledonian Societies.

Mr. Stewart F. Rutherford, besides being a director of the William Rutherford & Sons Company, Limited, is managing director of the Dominion Box & Packing Company, which was incorporated to take over the box business of the Wm. Rutherford & Sons Company, Limited.

Dominion Box & Package Company, Limited

Allied with The Wm. Rutherford & Sons Company, Limited, is the Dominion Box & Package Company, Limited, the operations of which are carried on in a mill occupying about one-third of the former company's premises. It is a separate organization although there is naturally co-operation between the two companies.

Formerly, the Wm. Rutherford & Sons Company, Limited, had a box factory at St. Henry, but three years ago they amalgamated with the Montreal Wire Bound Box Company, and formed the Dominion Box & Package Company, Limited, and a year later moved to their present location, where a new mill was built and equipped specially for the manufacture of packing cases.

Box companies are, as a rule, run on small margins of profit, and the management which desires to make money has to study ways and means more carefully than in any other form of woodworking, if packages of the best quality are to be produced which will at the same time yield the owners a fair return. In the case of the Dominion Box & Package Company, Limited, this matter of economical production has been carried out minutely, and the company is more than usually well fitted for the manufacture of a first-class article at the least possible cost.

The lumber yards are particularly well situated, it being possible to bring in lumber by canal, or by C. P. R. and G. T. R., place it almost directly into piles, from which it is but a short haul to the mill. Lumber is bought well ahead of the actual requirements, and at the time of the visit of the representative of the Canada Lumberman there was well over a year's supply of all the grades used in the business, a fact which is a very important factor in making quick and reliable deliveries required in this line of trade.

The mill itself occupies about one-third of the block bounded by Notre Dame, Atwater Avenue, and Levis Street, and is built three storeys high, every square foot of its floor space being utilized with a view to making the process as continuous as possible so as to prevent congestion and unnecessary handling, as it is the company's policy to save every cent possible in the cost of manufacture, in order that it may have more money to spend in perfecting the quality of its product.

The lumber, as it comes from the yard, is dumped behind the

Ritz Carlton Hotel, Montreal—Interior Finish supplied by The Wm. Rutherford & Sons Co., Ltd.

Windsor Station, Montreal—Interior Finish supplied by The Wm. Rutherford & Sons Co., Ltd.

surfacers, of which there are two, which deliver the lumber dressed on two sides directly into the mill, where it is piled at once behind the cutting saws, which are of the swing and live table type, placed lengthwise of the mill. The rip or fitting saws are placed at right angles to and beside the swing saws, so that the operators do not have to move from their tracks in performing their work.

This battery of saws is driven by two 10 h.p. motors suspended from the ceiling, which drive half of the sets through a very unusual and ingenious arrangement of belting and shafting. The drive was split in this way in the first place so that in the event of dull times it would be possible to run but one motor and operate but half the saws, but it is significant of the progressive policy of the company that it has never seen a time when it could afford to stop any of its saws, not to mention one-half of them.

The groovers are situated close to the saws, and in the centre of the mill, to avoid handling of the pieces and so as to be readily accessible from any of the saws, while each outside bay of the mill is occupied by a dovetailed jointer made by the Canadian Linderman Company, which are used for the finer class of boxes on account of the strength and neatness of the resulting joint as compared with the ordinary tongue and groove. As a matter of fact these machines are kept busy in preference to the regular groovers, on account of the saving possible in lumber and the superiority of the finished box.

Lumber matched together on these machines is as strong or stronger than solid wood itself, and it is a fact that where glue is used it is very seldom that a break can be made in the joint. It is self-evident that boxes made on these machines would be stronger than those made on the ordinary groovers as all slack and slip between the pieces making up the package is absolutely eliminated, and the resulting package is a rigid and safe container which, by actual test, shows itself to be 50 per cent. to 75 per cent. stronger than any other package on the market. Where it is not possible to make the whole box with this process, either the ends, sides, tops or bottoms are so combined with those made on the ordinary groovers as to produce a package which is amply safe and strong for the weight to be carried, and here again perhaps we have another secret of the fact that the company was running full time in the face of the present general depression in business.

There are two band re-saws for splitting the shook, one a twin which makes two cuts simultaneously with the same labor outlay as would be required for one cut, and a large single 7-in. machine which is used for the heavy work, such as shoe cases, etc. Cuts up to 33 in. in width are made on this machine every day. The twin is not suited for this heavy work but is an extremely fast machine for light stuff not exceeding 18 in. in width, so that the work is divided between them to the best advantage.

All Done by Machinery

The stock is next carried by a hoist to the second floor where the first operation is trimming for length and width, a very small allowance having been left so that the box when it is finished may be neat in appearance, and exactly true to size, after which it is usually stocked in a space extending across the mill, behind the assembling machines, or taken further along to the printing room where the printing is done in a most up-to-date manner by three rotary two-color presses and two small flat presses. The stock is then ready to be assembled, and goes directly to the assembling machines, which extend lengthwise of the mill, consisting of the best and most up-to-date machinery for the making of large and small nailed cases, dovetailed and lock corner boxes. All this work is done by machinery, and very little hand work of any kind is done except in special lots too small to be handled to advantage on the machines, or special boxes which require considerable hand work. The latter class of article is taken care of in the centre bay of the mill, where all the machinery necessary for their most economical assembling is located.

The finished cases, after leaving the assembling department are piled on large trucks by the men performing the last operation, and taken directly into the shipping room, where they are sent down slides to the teams in the street below, or sent to the top floor for storage until needed, by an endless chain carrier, which is reversible to bring them down again when required.

The company keeps several teams on the move throughout the city all the time, and in addition to these, uses a three-ton truck to very good advantage, affording in this way a very good delivery service to its customers, and extending its useful field of operation by several miles.

Across the whole mill in front of the cutting saws runs a conveyor for waste blocks, which dumps them on to an inclined conveyor which takes them to the third floor and dumps them into a bin on the second floor, so that the carts are loaded from this bin by gravity. All the wood waste from this mill which can possibly be utilized for the purpose is sold as kindling wood, and the company has a very good demand during most of the year for this waste. Formerly, it had been handled in trucks and boxes, which always resulted in congestion of the elevator, and a large amount of bother and inconveni-

ence to everyone in the mill, but, since the new system has been installed, there has resulted a large saving in labor, and a great increase in the cleanliness of the mill, and general satisfaction to all concerned.

The company gets the full time of its sawyers who are expensive men. There is never any waste under foot in any part of the mill, as everything undesirable in the lumber is cut out and disposed of once and for all, and the labor of handling the wood is reduced to a minimum.

The mill is driven throughout by electric motors, a number of machines being grouped together so as to secure the greatest economy in power consumption, and at the same time make it possible to run one set of machines for a special operation overtime without interfering with the rest of the mill in any way whatsoever.

Fire protection is provided by Estey Automatic Sprinklers all over the mill, in addition to which there are the usual hose outfits, water barrels and chemical extinguishers. A watchman is on duty every moment when the mill is not actually running, and his movements are checked by two separate detective systems, one of which can be operated as an alarm.

The mill is whitewashed inside from top to bottom, and is lighted all through by 40 watt, tungsten lamps, the resulting illumination being even and bright without being too brilliant, and there is light enough in any part of the mill for the men to carry on their work without the usual form of drop lamp.

Sawdust and Shavings

The sawdust and shavings apparatus is also interesting, and has one or two unique features which are well worth attention:—On account of the fairly good market for sawdust it pays to separate it entirely from the shavings, and this has been done by installing two entirely distinct systems, which are so arranged as to furnish draught where it is most needed without using any more piping than would have been necessary had the shavings and sawdust been mixed together. The planer room, where the majority of the shavings is made, is situated at the exertme end of the mill, and nearly 300 ft. from the boiler house, therefore a double 14 in. fan is installed on the third floor of the mill directly over the planer room, which lifts the shavings through the fan and over the roof to about the middle of the mill, where they are dropped from a separator to a single 18 in. fan also situated on the third floor, which acts as a relay, and drives the shavings over the roof to the boiler house. This 18 in. fan also carries shavings from the groovers and Linderman machines on the first floor, and from a small planer, also on the first floor, besides taking care of the various sweep-ups situated on all three floors, which are used only at certain times of the day.

In order to secure first-class and prompt attention necessary to repairs which are urgently required on the high speed machinery used by the Dominion Box & Package Company, Limited, and by The Wm. Rutherford & Sons Company, Limited, the former operate a very complete repair shop which handles all repairs for both concerns, including the upkeep of seven automobiles owned by the company, and also the filing equipment which is used in the same way as the repair equipment, both being in charge of the superintendent of the box factory.

The machinery was supplied by the following firms: Canadian Linderman Machine Company, Limited, Woodstock, Ont.; Samuel J. Shimer & Sons, Limited, Galt, Ont.; St. Paul Machinery Company, St. Paul, Minn.; W. B. Mershon and Company, Saginaw, Mich.; McGregor, Gourlay & Company, Galt, Ont.; Connell and Dengler Machine Company, Rochester, N.Y., and the Morgan Machine Company, Rochester. The saws are by the Simonds Canada Saw Company, Limited, Montreal; Henry Disston & Sons, Limited, Toronto, and E. C. Atkins and Company, Hamilton, Ont.

Responsibility for the various duties of the business are very clearly divided, and business must be done through the usual routine:—thus, the manager buys the lumber and looks after the financial matters, the office and sales, and has under him a head office man and superintendent, and to these two men only does he give instructions of any kind under any circumstances. This plan is carried out straight through the mill so that there is a direct chain of responsibility, and each important man in the chain has an assistant working with him in some capacity who can step in and take his place for a certain length of time without any appreciable interruption to the operation of the business. All this tends towards a more reliable and certain source of supply for the various users of boxes, because the plan from start to finish is organized for the useful application of effort, which cannot but result in a maximum of service and satisfaction to customers, and therefore to the owners.

Mr. S. F. Rutherford is the managing director of this company, and C. B. Fuller, Jr. is the superintendent. The mill was planned and built by them, and they are still working and planning to make it and its product better and to improve its operation, believing that the box business will be subject to improvements for some time to come, and meaning to stay in the lead.

Retail Methods Contest—Who Will Win the Prizes?

For the Best Letter on Yard or Office Troubles

Competition for Retailers

The last day for receiving letters in the Retail Methods Contest will be February 1st. Every letter reaching us by that date will run a chance of winning. Let us hear from you.

Retail Lumbermen have plenty of yard and office troubles. Everyone has his own way of handling difficulties. Send us a letter about one of your own problems and the way you handle it. We are offering prizes for the best letters.

Fifteen dollars for the best.

Ten dollars for the next best.

Five dollars for the third best.

If you do not come among the first three, you may be among the next five, to each of whom we will give a year's subscription to the Canada Lumberman. If already a subscriber, you will be given credit for another year.

It won't be any trouble to write and you may get one of the prizes.

Others will benefit from your idea; you will get the benefit from all the ideas of all the others.

Any yard or office problem will do. Make your own choice and write soon. The contest will close on February 1st and the prize winners will be announced as soon as possible after that date.

If drawings are necessary to illustrate your idea, they may be included, or a rough sketch may be sent, from which we will prepare an illustration. Make the sketch plain and our artist will carry out your ideas.

Three experienced retail yard men will be the judges.

The contributions will be numbered in the order received and the names withheld until the judges have given their decision.

Retail Service—Its Effect Upon Cost of Living

It is an interesting question as to how far the accommodation given to our customers goes to help us in securing more trade, and also, when this ceases to become such, and is regarded as a right we owe them for their patronage. I think all business men will agree that there are few things in business that have had such a rapid development as some things of this nature which the public has come to not only ask for, but demand as a right from the business man. We are giving a variety and a class of service now to the public that the most of us never dreamed of twenty-five years ago. Still, as any new service becomes common, appreciation of it ceases, and the demand for something else is created and the national query rises, what next, and how far is trade service going to go?

A leading grocer of this place said to me the other day that the women were agitating for the passage of a city ordinance compelling the grocers and others handling food products in the stores, to handle them with other appliances than the bare hands, and deliver them in the same way. This looks like an absurdity, but other things in the line of service that have now become common, were considered absurd and unreasonable at the time of their first appearance. And so it is. The burdens of doing business are increasing year by year without any corresponding benefit in the way of profit to the business men. Every dollar he makes now he earns every cent of, and in many cases, he earns it over again in his efforts to collect from those he has accommodated with credit.

There is a class of service that is beneficial to both business man and the consumer. It consists in studying the needs of the community in his particular line and supplying them with the best that can be afforded at the prices asked. In the case of the lumbermen, he is rendering a real service in educating his community as to which is best in building construction and the most economical. If he handles coal, he is performing a real service in trying to supply his customers with the best coal to be had for the price. It is the same in the case of the brick, tiling, roofing, fence and all other such articles which he may carry in stock. He is rendering good service in selecting the best he can secure in the market. The public naturally expects this of him, and it is incumbent on him as a duty to fulfill it. This kind of service, however, it not to be classed as a favor or an accommodation.

These are in a class of services by themselves, but they have become so common and expected from the business men, that neither they, nor the public seem to differentiate between what is fundamental service, and that which is added to it in the extension of favors that have grown into a custom. And the consequence of it all is that this extension of favors has grown to be "too much of a good thing" for the profitable carrying on of a business by the smaller business men. This is more particularly felt in the larger cities than perhaps in the smaller cities and towns where conditions are different.

A good deal of this giving of favors to the trade has resulted from the growth of emulative competition in business. The older and more primitive way to get trade, was by cutting the price, but the higher class of business men nowadays strive with each other as to who can give the best service in both quality and extent of accommodations and favor. This is emulative competition and includes everything in the way of producing something new to create desire and stimulate action to purchase.

When you and I delivered free of extra charge our first load of coal and our first lot of lumber, and if it was thirty-seven years ago, as it was in my case, we did it purely as an accommodation. For my part, I didn't expect, nor intend to keep it up as a regular practice, but after doing it once, I found it easier to do the same again. There was no telephone then, and it was difficult for people to get the drayman when they wanted him. A good deal of the time he was working for me by the day, and so I got to making small deliveries without charging for it. It was not long, however, before the word went around in the little community that I was delivering free of charge. My competitor of course heard of it, and he jumped to the conclusion that I was doing it as a bait for trade, and he too began doing the same thing without coming to me and learning the circumstances of how I came to do it. Within a year free delivery was fastened on us both.

When I settled in the next town, I found the dealers were giving free delivery of building material to carpenters only and to owners who bought a bill with a stipulation in the contract that it should be delivered on the ground within the town limits. Coal was delivered free from the car only. But, as all three of us dealers had teams of our own, it was not long before each of us was surreptitiously offering to deliver stuff as a bait for the business. Within two years, free delivery was an established custom with the lumber and

coal dealers. Other lines of business held off from it for a year or two longer and it was some time before it became as universal with them as it is now in every place of its size among business men generally. And the public have come to look upon it as a right the business man owes them for their patronage. The idea of its being a favor only never enters people's minds nowadays, and so common has it become, that merchants consider it as a part of their business, include it as a part of their expense account and charge it to the costs of doing business, thus making the public pay for it after all.

Would Not Go Back

I don't suppose there is hardly a dealer now who has got in the habit of free delivery who would, if he could, go back again to the old system of having every customer doing his own delivery. We never go backwards in anything of this kind after ourselves and the public have become adjusted to it. But while we would not change for the old way, yet there is a growing sentiment in the retail business world, that free delivery is being abused by the recipients of it. It may be though that the fault is not all with the public. With the compelling force of the high cost of doing business behind them merchants are driven to the necessity of doing most anything to hold their trade. One of our druggists told me recently that his deliveries averaged over a hundred a day, and were put on the books at that. He told me further, that his bookkeeper makes out at the end of the month an average of 2,000 statements of account, ranging in amount from 5 cents to \$100. Some of his "long winded" customers leave a year's bill unpaid and go away to foreign countries for a pleasure jaunt. But such as this is a common thing here in the city. I've only given you a mild illustration of the "white man's burden" who is in the retail business in a large place.

This question of abuse of delivery came up at a meeting of our Commercial Club and from the accounts of individual experience that I heard, it would seem that the women folks were mostly to blame for it, because of their failure to consider the interests of the people who are serving them. It is a common thing for housekeepers to 'phone the store seven or eight times a day for as many different items, when by the exercise of a little planning and forethought, they could include them all in one, or at most, two, deliveries. Then again, servants are often allowed to do the buying for the house, and they, like their mistresses, don't care how much trouble they put their grocer to in delivering the order.

I might mention in this connection another phase of this purchasing of supplies by employees. I don't want it to be understood that it is general here in the city, but there are too many cases where the business man has to pay more or less of a commission—graft is the real name for it—to the employee who is entrusted with this business for his employer. I know I lost several customers because I refused to "come across" with the percentage of "graft" required. Of course, you have nothing like this in the country towns, but you are "held up" in other ways that are not quite so direct.

Lumbermen have been and in the larger city close by, are exempt from much of the excessive abuse of free delivery, but it is chiefly owing to the nature of their business that they are. They are not wholly free from it, however. I didn't know the real meaning of free delivery for a lumber yard till I engaged in business here. I have been asked to deliver one post and a 2 x 4-16 at a place that was two miles from the yard, and have done it too. That is only a sample. I could tell you of other instances that would make you think yourself lucky to be where you are as far as delivery is concerned. You hear tell of the high cost of living. The agitation of it came first from the cities where the general items of such things as clothing are about the same prices as in the average country town. Food stuffs are necessarily higher of course, but it is the enormously high rents and the cost of the excessive service required for distribution that has made it increasingly difficult for the small merchant to make anything over and above a living, and so it has come about that the larger part of the retail business in a city like Chicago is being done through the department stores. 'Tis true there are a multitude of small shops scattered throughout the city on the street car lines, but their business is mainly catering to the immediate necessities of the neighborhood.

It Will Come in the Smaller Towns

I have in the foregoing briefly described the class of service that has rapidly developed within the past few years to make it more difficult for the smaller business man to do business and compete with the larger aggregations of capital, and there is no question in my mind regarding the merchandising business in the smaller country towns. There will be a concentration of the bulk of the business into the hands of men who are real merchants who will operate in department stores, thus reducing materially the cost of operating expenses, and at the same time, giving the public a greater variety of stock to choose from and at even lower prices than they can buy from the outside mail order houses. The smaller fry of so-called business men will be to

some extent eliminated, and the rest will run a few little shops for an uncertain living.

The bane of the country business man has been the loose business methods which long custom has practically compelled him to follow. The times and conditions have so changed, however, that he is perforce obliged to break away from custom and adjust himself to accomplished facts in the changed conditions that have affected everything in the way of living. What is now become customary service he accepts. The expense of it he includes in his cost of doing business and, in the last analysis, the public pays for it, and therefore it makes another item in the cost of living which the public is protesting against and at the same time, putting the blame of it all on the retailer and other middlemen.

Higher Cost of Labor Contributes

There is one thing, however, you rarely hear about in this connection and yet it is one of the principal causes of the advance in prices on many commodities, and particularly on the cost of building. That is, the extraordinary increase in the prices for labor. In nearly all the industries the eight-hour day has been established. This means that it takes 20 per cent. more labor to turn out the production for a day, and is practically that much advance in the cost. Then again, the wage scale has almost doubled from what it was twenty years ago, and when you add this to the shortening of the hours of a day's work, the two together would naturally seem a logical reason for the general complaint that the cost of living has nearly doubled during this period of time. Of course, there are other things entering into the causes for this increase in the price of labor, but it is too large a subject to be discussed here. I merely mentioned this labor business because it is usually ignored by people when complaining to the retailer that he is charging too much for his goods, and they rarely see anything said about the labor proposition in the newspapers they read.

Considering now more particularly the case of the retail lumberman in reference to service, as I have said, the service he now renders to the public he has come to consider as a part of his business, and his study now is to increase its efficiency without materially adding to its cost.

Another Contribution to Cost

But there is an element in his business that is of the nature of service that he does not get the meed of credit for, that its importance warrants by its value. It is an expense to him, but it is of such a nature that he cannot pass it on to the consumer. I refer to the accommodation of credits that he gives to his customers. Every time you make a sale to a customer, and give him an extended time to pay for it, you are giving him the service of just that much of your capital. What profit you make on the sale is the pay you get for your service in assembling the stock and keeping up the yard to sell it in. Now, if you take the 2 per cent. discount on your bills and sell the stock on 60 days, or longer time, you are giving the customer what you have received in the way of discount. If he has money drawing interest on deposit at the bank, you are saving him the interest on what he would have had to withdraw to pay you cash for the sale. If he has no money, but wishes to hold his produce for a higher market you are loaning him that much of your capital for the purpose, instead of the bank. You thus give him the service, and pay for it as well. Yet, this class of service is not thought of nor considered as a service by the customer nor the public either. I doubt if the average retailer has a realizing sense of it being in the nature of a service, and this is the reason for my drawing attention to one of the commonest facts in the business.

There is another factor in the retail lumber trade also, that receives a large amount of service in the way of accommodations which neither they or the public realize the extent and value of it as service. The building contractors sometimes get it into their heads that they are more necessary to the lumberman than he is to them (a question that I won't discuss in this connection because it is not relevant to what I wish to show). But, granting that they are a necessary factor in the business of a retailer, is it not a fact that in the large majority of cases the dealer pays for their services, out of all proportion to the value in profits he receives from the bills he sells them. The bills would have been sold by the dealer anyway outside of the contractor as an intermediary. The owner can hire his men by the day to do the job and employ the would-be contractor to oversee it. So when you come down to "brass tacks" the contractor is not an absolute necessity for the average building in country places. He may be rated as a convenience though, instead.

Must Be Handled Carefully

However this may be, the contractor in the country town is a factor in the business that has got to be reckoned with, and carefully handled as well. I presume there is no one thing in the retail end of the lumber business that causes more thought and worry to the dealer than the country carpenter who thinks he is qualified to take contracts and make more money out of them than by working at his trade for

daily wages, and this applies as well to the other trades that use the materials, which are now, and generally have been, a part of the stock of a country lumber yard. Except in rare instances, none of them have any capital in the way of money to put into their business and the main cause of their trouble to the dealer is not because they are not honest in their intentions but because of their lack of ability to figure and secure jobs at figures that will cover contingencies and give them a profit over and above their daily wages as workmen. It is because of this lack that the necessity for something to do drives them into competing for jobs at any figures they can secure, and the dealer is supposed to bear all the brunt of this because of their lack of ability and their necessity. The worst of it all is they consider it an obligation on his part to do this in return for their patronage and "legging," as it is called, for his yard.

There is no other line of business in the town that has to do with such an element as this. I don't know as there is in any branch of merchandizing anything of this character, and therefore other business men have not the experience to enable them to appreciate what it means to the lumbermen. As with other things, however, the dealer accepts and deals with it as being all in the day's work and uses his tact and diplomacy as best he knows how in coping with the conditions as they develop in the year's business. The service he gives the contractors is unknown, but it is customary, and he knows, if he doesn't give it, there are other dealers who will. So both he and his competitors are used by the contractor to club each other in their efforts to get his trade.

But with all this customary liberal service and furnishing of capital to do business with by the dealer to the contractor, it can be said of the latter that he is never wholly satisfied. There probably are some exceptions to this general rule, but I have rarely found them in my experience in a country yard. No matter whether he is a day-working carpenter, mason, bricklayer or plasterer, when he changes to a jobbing contractor and wants to furnish the materials, he wants the dealer to let him have them at prices lower than he will sell to anyone else. He seems to lose sight of, and forgets, all the other accommodations he receives, and demands this as his right. I have never yet come across a carpenter who did not think so, and if this privilege is given him it won't be long before he ceases to regard it as a privilege, but as something that is owing him for his influence, which in most cases is largely imaginary.

You understand, of course, that I am speaking of this point in a general way. As we all know, there are some cases where a dealer has an exceptionally prompt paying contractor and besides is a regular customer. In this case it pays the dealer to be more liberal with him in this respect, than with the ordinary little petty jobber, whom he has to nurse along and watch out to get his money from. One has to be chary about giving service of this kind. He has to give enough as it is of other character. It is surprising, when you think of it, how much we have to give besides our time and capital to secure trade and hold it.—C. H. Ketrige in the Mississippi Valley Lumberman.

System in Checking at Planing Mills

As the primary and in fact the only reason for checking work of all kinds is that we may discover any errors contained therein, it stands to reason that the methods employed in checking should be proper and thorough.

We who are engaged in the strenuous work of getting out millwork at a profit in competition with others who work as hard and figure as closely, know that it is a constant temptation to pass work along without the proper amount of checking. The legitimate result of this condition of things is that about all the checking a man is able to get on his work is that which he is able to give it himself.

We also know that while a man can check his own work more quickly than anyone else can, he is really more liable to duplicate his errors, and on this account should systematize his methods of checking so as to cover all the possibilities for error that he is liable to locate.

To begin with, let us consider the checking up of an estimate. If the estimate is made from a list it is a mere matter of checking back against the original to get the correct items, and the unit prices and extensions will be subject to the same care in checking as in the list made up from the plans.

When taking off quantities from the plans we have found it expedient to use some small pencil check on the blue-prints, usually a yellow pencil making a small check which is easily erased, and check every item of millwork on both floor plans and elevations. One might think that this would insure the taking of all that work on any and all buildings, but such is not the case by two distinct classes of items.

Checking Plans and Specifications

In cases where the details accompany the floor plans and elevations we often find items which do not show in the main set of plans at all. We often find items shown on sections which are not included

in either floor plans or elevations, so we have come to the conclusion that it is the better part of discretion to put our check on all of the details as well as on the plans.

The next part to be checked is that of the specifications, for we often find many things included in the specification which are in no way indicated on the plans and details.

So far we have checked only for quantity with each characteristic description, but in order to get at an intelligent pricing we must get at the component parts of the details and check them to be sure that we do not figure a 14-inch paneled jamb the same as 2 by 6 rabbeted one. We must check our plate glass openings separate from our D. S. glass and the art glass still differently.

Another important item of checking is that of negative checks. By negative checking I mean the checking of items usually considered millwork but which are excluded from the bid on account of being specified as metal, such as windows, fireproof doors and frames, switch cabinets and the like.

Excluding by Negative Checks

In certain cases the contract is divided into two or more parts, such as "construction," "interior finishing," and perhaps the latter has several subdivisions, so that the only intelligent check we can get on the plan is to check all the items, and as fast as we learn through notes or specifications that an item is excluded, to give it a characteristic mark, usually a red check, so that when we give the plans our final visual inspection for items missed, we will not be annoyed by having to stop and look up items only to find that they are excluded.

When we have all of our available data checked and are satisfied that we are not short on quantities, and that we have all the notations on the estimate necessary to enable us to understand the relation between items and prices after the plans are gone, we are ready to put the prices opposite the items.

As this article intends to deal with checking and not particularly with estimating, it matters little what system of analysis is carried out in listing the items from the plans. However, if openings are used as the unit basis for items and analyzed into doors, frames, transoms, trim and perhaps a column or two for special items such as glass or cabinet trim work, it is necessary to check through the additions that make up the unit prices. In some offices this is done by some clerk or assistant on the adding machine, and at the same time multiplying by the number of units into the proper extensions.

One of the dangers of unit pricing in this way is that of improper extensions such as figuring a twin or other multiple opening as a single one. Perhaps we might put down the price of a single window instead of a twin and there might be a large number of such units. One good way to prevent this is to begin close to the front side of the quantity column and put the word twin or whatever the multiple may be in the column with the figures, or if there is not room for it all it may be started in the figure column so as to insure its being seen when looking back for the extension number.

While upon the subject of extensions I would say that the tentative check is of the utmost importance in the discovery of error, and by this I mean looking back from the result put down in the extension column to the unit price and then to the number of units. One can tell within an insignificant amount whether the result is what it should be or not, by sensing the principal figures of the numbers involved. If it looks out of line he will proceed to verify it. If it shows up with the right beginning and the correct number of figures he knows that it must be right within a negligible limit.

Another good check in estimating is that of putting down on the estimate sheets various obscure items encountered when the estimator is looking for something else. It is not well to break up the routine of an estimate for this purpose, but it is often the means of catching items which might otherwise be missed. These should be handled as notes on a separate sheet and then at the proper time incorporated into the body of the estimate.

Listing the Items Accurately

After a contract is secured, the next move of the mill is to get out a listing of the items to be made in accordance with the desires of the customer, generally indicated by that part of the work he needs first in his work of construction. In the case of blanket bids, it is necessary to check this list against both the plans and the estimate, and the items on the estimate should be checked as fast as listed, so that as the work progresses one may tell by looking at the estimate sheets just what part of the work has been gotten under way.

If the prices of the items listed are put on the office copy of the listing or order sheets, and checked against the estimate, it will be easy to keep track of the amount of stuff sent out from time to time and bill it out with the proper charge.

The billing of the work into the mill is more liable to error than any other part of the clerical work in connection, on account of the multiplicity of items, and for this reason it is very desirable to have some efficient method of self-checking.

Some foremen who do their own billing insist on laying out full

sized sections of complicated work before billing it out, while other men handle the work simply by figuring it through, for all kinds of work may be figured, and generally more quickly than a layout can be made. But if a man knows that a layout is the only efficient check on his billing then he should check in that way, and his workmen can use the same rods or patterns later when doing the work, thus dividing the expense of billing with that of work in the mill.

The grouping of quantities for convenience in handling in the mill is bound to complicate the work of billing and also the work of checking, but if we check our horizontal members against our widths, and our vertical members against our heights, and our whole numbers against the totals on our listing sheets, we are not apt to bill the wrong number of pieces. Then if we check our list of prices against the details of the work in hand we are not apt to miss any class of pieces which occur in the billing.

After the bills go into the mill, the checking of the various workmen through whose hands they pass must be done with painstaking care, and this does not necessarily mean that they must spend a lot of time in this part of the work.

There is always the temptation on the part of some machine men such as sticker and jointer men to work the pieces brought them, and then if they are required to check each item to take the bills and check off every item as it comes without counting them or measuring any of them to see if they are of the size billed. They say they haven't time to measure up every piece, but we all know that it is not necessary to measure every piece unless every piece is different, but to count them either before or after running is not such a great task as it is to make a subsequent setting to run the shorts.

So every separate workman who has to pass on the material should have a distinctive check, and if an error in cutting or machining succeeds in passing them all it goes to show that they must be very careless in keeping tab on their work, and that they are paying more attention to the bills than they are to the material.

As the amount of time taken to check material in transit through the mill depends so largely upon its order and arrangement by the cutter, it stands him in hand to so arrange the material on the trucks that it may be rehandled and repiled in some sequence which will allow every man who does this to machine and check the material afterwards with a minimum of time.

The danger of advance checking is encountered when any man attempts to check his material before it goes through the operation for which he is responsible, on account of the liability of error of previous workmen, his own liability to spoil some of the stock and the possibility of some of it turning out bad for reasons beyond his control.

I remember one case of a foreman putting up cabinet trim and when he took a set of jambs and casings to a bench man to put up he would check off the item on the plans and enter it on a list of his own. When he had his list complete and ready for shipment he had several sets of trim for which he had no place. When the shipping clerk came to check the shipment he was short as many sides of trim as the foreman was long.

The only explanation of the matter to be figured out was that after the foreman had delivered the material to the bench man and had checked it off, the said bench man had been taken off and put on other work before completing the trim job, and in this manner some of the material had been counted and checked twice. It will readily be seen that if he had waited to make his check until the stuff was actually started on its way to the wareroom he would not have fallen into this error.

Another case involving a good shipping clerk was that of marking and checking a large number of packages as being actually loaded into a certain car before they were loaded onto the trucks for that car. He could easily mark and check the material and say to his men, "This all goes in the car." Of another pile of bundles he says, "This goes local and must be loaded on the wagon," and he may check it the same as the carload stuff. But the fault in this practice develops when the company learns later that certain bundles enumerated on the shipping list were not to be found in the car upon its arrival at destination a thousand miles away. Of course the roustabout help had loaded some of the carlot stuff out with the local shipment and it was found after several weeks' delay.

When the items enumerated on the order or listing sheets are shipped, it becomes the duty of someone to check the office copy with the shipping date, or if but partial shipment is made, then to check that part as shipped.

It will depend upon the routine work of the office how the charges are made, but it will be necessary to put an accountant check upon the order sheets as they are entered in ledger or journal so that one may tell by looking at an order sheet whether it has been billed, shipped and charged.

Because I am putting so much stress on the subject of efficient checking, let it not appear as a mere bunch of red tape to be tangled and then thrown away, but make it a matter of efficient training for

every part of the working force, and the results are bound to be a cutting in cost of both overhead and productive labor.—Chas. Cloukey in Wood Craft.

Side Lines for the Retailer

Stouffville, Ont., Jan. 5th.

Editor Canada Lumberman:

Up to the present time the writer has been very busy with the fall trade which we are thankful to say has been fine. The last season's trade in this district has been the best around here for years. We did a nice steady business, and of course we do not have to depend on the loan companies for our money, but on the farming community. We have no spurts and stops in our trade but it is steady and solid. Last year's business was fully 25 per cent. larger than that of the year before.

Regarding the side line question, we have no fault to find with our trade carrying side lines at all. In fact we are doing some of our best business with an outside business. There are certain lines which are coming into use, that the lumber dealer has to get, or he will lose that trade which is naturally his. One of these is the galvanized shingle. While we do not claim that they are better than the wood, we must sell what the customers want, but at their own risk. We go to a man and if he won't put on wood we naturally must get some returns from that which was ours at the start, so we sell him what he wants. The same thing applies to the different ready roofings which are on the market. Some want one thing and some another. We do not all think alike. If your neighbor does not come to your way of thinking, go to his, and sell him what he wants. One thing we must say is that the more metal we sell the more wood we sell. Another item which we are selling is the wall board. We must look for something to take the place of that which we are being deprived of.

The outlook for the coming season is even better than last year at this time, so we are looking forward to a good business year for 1914. We might also add that our dealings with the wholesale firms have been of the pleasantest nature, which helps out.

Yours truly,

D. M. Heize & Co.

Personal Mention

P. D. Roe, of Port Moody, B.C., one of the best known of Coast lumbermen, will leave shortly with his family, on a trip to his old home in Scotland.

Mr. W. G. Barron, New York sales representative of W. C. Edwards & Company, Ottawa, Ont., headquarters 1 Madison Ave., spent the Christmas and New Year holidays at his home in Canada.

The Hoo-Hoo of Port Arthur and Fort William, Ont., are arranging for a concatenation on January 23rd, to be held in the Masonic Temple, Fort William. H. W. Robinson, Vicegerent Snark for New Ontario, will be in charge and reports a fine prospect for a great concatenation.

The marriage of Miss Agness Watson, daughter of Mrs. Wallace Watson, Montreal, with Mr. Cameron Macpherson Edwards, of the firm of Watson and Todd, Ottawa, was recently celebrated in St. Paul's Church, Montreal. Following the ceremony a reception was held at the Ritz Carlton Hotel, after which Mr. and Mrs. Edwards left for the south for the honeymoon.

Among the recent marriages of interest to lumbermen in Western Canada are: O. A. Murphy, manager of the McLelan Lumber Company, Ladner, B.C., to Miss Kate Plewes; R. B. McKamey, manager of the Imperial Timber & Trading Company, Vancouver, to Miss Helen A. McRae; and A. K. Leitch, manager of the East Kootenay Lumber Company, to Miss Josephine Haville, of Cranbrook.

J. B. Beveridge, manager of the Dryden Timber and Power Company, was in Toronto recently on business. The plant of the company is closed down for a few weeks while one of the evaporators is being rebuilt so as to increase the capacity of the industry. It is expected that the financial affairs of the company will soon be straightened out satisfactorily, and the directors are looking ahead to a good year when operations are resumed at the end of January.

Mr. S. Austin Hurlbut, northern representative for F. W. White-man, Philadelphia, hardwood and white pine wholesaler, who spends most of his time in Canada and the northern States, reports, after a recent business trip that he believes improvement will come in the spring. He also looks for a condition more nearly normal rather than a short-lived rush with high prices and subsequent reaction. In this connection it is of interest to note that the trade generally are looking for a quiet but steady return to normal conditions rather than a decided rush after the present quiet. Mr. Hurlbut reports white pine and spruce prices steady in spite of the decreased volume, and looks for higher values with spring business.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

WANTED—Hemlock or Spruce Logs or Lumber. Apply to Box 905, Canada Lumberman, Toronto. 22-23-24-1-2

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co. Ltd., Toronto, Ont. 7-tf

Cash For Hemlock

1-in. x 2-in., entire cut, delivery March to May. Furnish full particulars to Box 934 Canada Lumberman, Toronto. 2

Wanted

Best quotations on car Cedar Posts, 3½-in. to 4½-in. tops, peeled, sound and dry.

A. G. HULL & SON, St. Catharines, Ont. 2

Wanted

1-in. and 2-in. Spruce and Hemlock for spring or summer delivery; will make an advance on stock.

A. N. DUDLEY, 109 Stair Building, Toronto, Ont. 1-2

Wanted to Buy

500,000 ft. log run, sawn Hard Maple, various thicknesses, M. C. out. Must grade proper centage 1S and 2S and No. 1 Common and not to exceed 20 per cent. No. 2. Will pay cash when loaded on cars; or will buy good Maple logs in the round, 12-in. and up diameter.

Write P. O. Box No. 1595, Montreal, giving best price and rate of freight to Montreal. 2-t.f.

Hardwood Pickets Wanted

Beech, Birch and Hard Maple.

1 x 1 x 42.
1 x 1 x 48.
1 x 1½ x 42.
1 x 1½ x 48.
1 x 1¾ x 42.
1 x 1¾ x 48.

Require Thickness, 1/16-in. Plump. Quality—Free from all defects.

Can take delivery of green or dry stock.

Apply to The Canada Wood Specialty Co., Ltd., Orillia, for full particulars, price, etc. 24-1-TF

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

For Sale-Lumber

For Sale

One thousand cords dry softwood slabs and edgings. Canada Pine Lumber Company, Limited, Hamilton, Ont. 24-1-2-3

For Sale

About 35 M. ft. 3 x 4 to 10 8/13 Mill Run Dry White Pine.
Apply P. O. Box 58, Smith's Falls, Ont. 2

For Sale

50 M. ft. 5/8 Dry Spruce, Clear and No. 1. 100 M. ft. 5/8 Dry Spruce, Merchantable.
Apply Box 942, Canada Lumberman, Toronto. 2

For Sale

Spruce and Jack Pine, sawn to order up to 12 x 12. Write for prices.
H. C. DUNBAR, Haileybury, Ont. 2-3

For Sale

About 200 M. ft. of Hardwood logs from 9-in. to 13-in. in diameter. F.O.B. cars, Sherbrooke.

Apply E. L. DARCHE, Ascot Corner, P.Q. 1-4

For Sale

8/4 Soft Elm.
4/4 Soft Maple.
4/4 Soft Elm.

In car lots only. The above is well manufactured and bone dry. Apply Box 925, Canada Lumberman, Toronto, Ont. 1-2

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

10 M. ft. 4/4 No. 1 C. & B. Basswood.

J. AUSTIN & SONS, Kinmount, Ont. 23-24-1-2

\$15,000,000.00

We have about fifteen million dollars worth of timber lands for sale. Write us what you want. Dealers in timber lands, lumber yards, mill machinery, mills for sale, arranging loans, selling and exchanging cut-over lands, and a general real-estate business. If you want to buy or sell write us.

THE JANESVILLE EXCHANGE, Timber Department, Janesville, Wisconsin. 1-t.f.

Wanted-Machinery

WANTED—One pair twin circulars, for slabbing logs down to 4 inches and up. Must be in good condition. Apply 524 Board of Trade Bldg., Montreal. 23-t.f.

WANTED—One pair steam engines, capable of developing 500 h.p. for sawmill. Must be in good condition. Apply 524 Board of Trade Building, Montreal. 24-t.f.

Wanted

Second-hand steam feed Cylinder. Must be at least 36 ft. long and 7-in. or 8-in. bore.
Apply Box 932, Canada Lumberman, Toronto. 2-3

For Sale-Machinery

Wickes Gang

A first-class machine at a bargain.
23-24-1-2 W. L. MILES, Saginaw, Mich.

A Bargain

44-inch Wick Gang for sale at a bargain. In first class shape. Apply,

Fraser Lumber Company, Ltd., Plaster Rock, N.B. 2-7

STEAM ENGINE

One only High Speed Leonard, 75 h.p. Steam Engine, in good condition. Special bargain.

J. P. Abel, Fortin & Company, Maisonneuve, Montreal. 2

For Sale

1—Giddings & Lewis Horizontal Slab Re-saw.
1—Pair twin slabbers for ties.
1—Payette Box Board Edger.
1—Engine, 12 x 20, complete.
28—Wrought iron dry kiln trucks.
All in working order.

FIRSTBROOK BROS., Penetang, Ont. 24-1-2-3.

Woodworking Machinery For Sale

1 2¼-in. Waymoth variety lathe; 1 No. 1 Ballantine power feed dowel machine; 2 8½-ft. iron frame swing saws; 1 8-in. Bentel & Margendant universal woodworker; 2 24-in. Ideal planers, matchers and moulders; 1 36-in. Egan double drum sander; 1 12-in. MacGregor-Gourlay four side moulder; 1 54-in. Jackson-Cochrane Resaw; 1 Hespeler upright power mortiser. H. W. Petrie, Limited, Toronto, Montreal and Vancouver. c

For Sale at a Bargain

1 10 in. x 10 in. Simplex Pump.
5 Steam Engines.
1 Killam Stock Gang (New).
1 Mitts & Merrill Hog, No. 20, 10 in. x 12 in.
1 Ricker with 30-in. Saw.
1 St. John Iron Works Driving Gear for Band Saw Carriage.
Edger, Planers, Shingle Machine, Chain Blocks, Trolleys, Saw Arbors, Pulleys, Rotary Saws, and a large lot of Steam and Mill Fittings.

Address, T. N. McGRATH, Tusket, N.S. 20-t.f.

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents.

Position wanted by thoroughly experienced Bandsaw Filer. Address H. J. c/o Canada Lumberman, Toronto. 2-3-4

Experienced lumber salesman will be open for engagement February 1st. Address Box 933, Canada Lumberman, Toronto. 2

Position wanted as single or double band sawyer. Good references. Apply Box 928, Canada Lumberman, Toronto. 1-2

Position wanted as single or double cut band sawyer for coming season. Good references. Box 940, Canada Lumberman, Toronto. 2-4

Advertiser, desirous of change, wants position with retail lumber firm as ledger keeper or general office work. Several years' experience in city. Box 941 Canada Lumberman, Toronto. 2

A first class foreman carpenter desires to change his position. Specialist in transportable wooden buildings, such as hospitals, schools, cottages, bungalows, villas and farm houses. Have worked in the largest factory in Germany. Familiar with export trade to South America and Italy. Aged 39 years and energetic. Address Box #30, Canada Lumberman, Toronto. 2

A progressive, practical, live man; a hustler; forty years of age, wants a position with a wholesale house located in Eastern Canada or some of the Northern or Middle States. Has had experience in following the lumber industry from stump to market, and has made the manufacturing and grading of hardwood a special study. Well versed in the "National" rules as well as in the requirements of the English markets. Is well qualified to pursue chase stock on contract, or otherwise, for both the American and foreign trade, or will act as salesman in any of the English-speaking markets, or as culler if a satisfactory salary is offered. Uses no intoxicants whatever. For further particulars apply to Box 939 Canada Lumberman, Toronto. 2

Wanted-Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

Men for sawmill wanted: Engineer, fireman, sawyer, jacker, setters, tail sawyer, lath contractor, pilers and others for Band Saw Mill at Kearney, Ont., for summer season. Cut is pine. State age, habits and firms previously employed with. Apply W. J. Armstrong, Biscotasing, Ont. 2-3-4

WANTED—An experienced accountant in the lumber business to take the Secretary and Treasurership of a new organization in a Western Canada progressive city. Must be prepared to subscribe two or three thousand dollars' worth of stock. When replying state salary expected and enclose references. Apply Box 931, Canada Lumberman, Toronto. 2

Men For Sawmill

Wanted: Engineers, firemen, sawyer, jacker, setters, tail sawyer, lath contractor, pilers, and others for Band Saw Mill at Kearney, Ont., for summer season. Cut is pine. State age, habits and firms previously employed with. Apply W. J. Armstrong, Biscotasing, Ont. 2

Business Chances

For Sale—Planing Mill

A going concern. Consisting of lands, buildings and machinery in good live town, Waterloo County. A. C. Bender, Real Estate, Berlin, Ont. 23-24-1-2

Bargain if taken before January 15th. Tug Marie Louise, length 65 feet, beam 15 ft., 50 h.p., steam 200 pounds. Hull rebuilt 1911-12, fully equipped, electric lighted, cookery outfit, sleeping accommodation for 7 men. Also two scows.

The Baker Lumber Company, Ltd., Lindsay, Ont. 23-24-1-2

Saw Mill For Sale or Lease

What is known as the scenic Island Mill at Little Current. Cutting capacity 140 M. inch lumber in 10 hours. In first class condition.

Possession can be given 1st January next. For further particulars apply to

THOMAS CONLON, 44 Church Street, St. Catharines, Ont. 21-t.f.

For Sale

Timber limit consisting of 10,000,000 feet of Pine, Spruce, Hemlock and Hardwood, tributary to Lake Nipissing. Also sawmill and logging outfit, boom timber and chains. Good reason for selling. For particulars address Box 846, Canada Lumberman, Toronto. 19-t.f.

Wanted to Buy

One or two lumber yards each doing a yearly business around \$30,000. Would like to trade some farms in on the deal. Apply to K. T., c/o Canada Lumberman, Toronto. 24-1-2-3

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. 11

For Sale

Rare bargain. Band mill located in best lumber and log center on Puget Sound. Rail and cargo shipping facilities. Excellent log pond. Ten and a half acres of land. Price one-fourth of appraised valuation. Must sell quick. Box 765, Canada Lumberman, Toronto, Ont. 8-t.f.

For Sale

Lumber Limits in Eastern Canada, 50,000 acres, large Sawmill, fully equipped going concern, on salt water. Correspondence solicited. Will be sold right to close estate. Address, Timber Limits, care Canada Lumberman, Toronto. 22-t.f.

For Sale

Fully equipped sawmill, capacity 35,000 ft. per day. Most advantageously situated in one of the large lake port towns. Splendid harbor, railway sidings, and everything complete for doing business. Large local trade. Bargain price for immediate sale. Satisfactory terms can be arranged. Apply Box 938, Canada Lumberman, Toronto. 2

Saw Mill Property For Sale or Rent

The following are some of its leading features: Situated near Little Current, on the Georgian Bay, on what is known as Picnic Island. Contains 37 acres of freehold property which includes the mill and more than twenty other buildings. It has been leased by the Wolverine Lumber Company during the past seven years, and their lease expires the first of January next. If they buy more limits they may likely continue the lease. In the meantime we are offering the property for sale or rent. The mill has been cutting about 20,000,000 a year on small logs and a ten-hour day. The Island is in unorganized territory and our yearly tax on it is only one cent an acre in addition to the Little Current school tax of about twenty-five dollars a year. The power consists of two engines—a 24 x 30-inch and a 20 x 20-inch cylinder. Five boilers 60-inch diameter by 16 feet long. A double cutting band, a wickes gang (36-inch) and a circular saw. Two trimmers, two edgers and good lath mill capacity. The protection against fire is probably the best on the Georgian Bay; with a fine large pump in the machine shop, and a water tank outside ninety feet high with water pipes leading to the mill and all the houses on the Island, four streams at once can be thrown on the mill. We carry \$62,000 insurance on the mill and on all the buildings, the average rate being less than four per cent. Our piling capacity consists of 2,200 feet of stone-filled docks holding about ten million feet, and ten million more in the rear on the ground. Vessels can load at the docks to sixteen-foot drafts and be well sheltered. First-class booming room for about 15,000,000 feet of logs, 650 booms and chains. We carry boiler insurance, and the inspectors' report this year testifies that everything is in good condition. The average loss of time during the past six years is probably less than three days in the season for repairs, and the quality of the manufacture is among the very best on the Georgian Bay. To build up this property at the present time would cost at the least \$200,000, but we do not care to go back to the active work of running it, and will sell the property free of encumbrance for \$75,000 and on easy terms of payment. There is now a railroad running into Little Current which will materially increase the value of this property. If we do not sell soon, would lease it for a term of years at a reasonable rent, and will be pleased to correspond with interested parties. For further particulars apply to the undersigned.

Thos. Conlon,
44 Church Street,
St. Catharines, Ont.

Fine Timber Tracts

We have a number of timber tracts for sale in most all states at low prices and reasonable terms. Have few bargain tracts that are offered for quick sale. Write us what you want, we have it.

THE JANESVILLE EXCHANGE, Timber Dept., Janesville, Wis. Dealers in timber lands, lumber yards, mill machinery, mills for sale, arranging loans, selling and exchanging cut-over lands, and a general real-estate business. 1-t.f.

Miscellaneous

Boiler Tubes for Sale—We have on hand a quantity of 3-inch second-hand Boiler Tubes taken from a 14-foot boiler. Will sell cheap, Stevens-Hepner Company, Limited, Port Elgin, Ontario.

For Sale

Tugboat, 65 ft. over all, 14 ft. 3 in. beam, 8 ft. deep, fully equipped with winches, 10 and 20-in. compound engines, surface condensers and pumps. All connections and pipes brass and copper. Address T. N. McGrath, Tusket, N.S. 20-t.f.

Tenders for Cedar Poles

Tenders will be received by the Suburban Construction Company, c/o G. C. Royce, 90 Sherbourne Street, Toronto, for the supplying of approximately:

2,300 45-ft., 8-in. top, Cedar Poles.
350 35-ft., 7-in. top, Cedar Poles.
100 60-ft., 8-in. top, Cedar Poles.

Tenderers will furnish particulars of the quality of the poles and point of inspection. 2-3

WANTED

Correspondence with mill willing to manufacture full count White Cedar Shingles.

J. E. Harroun & Son,
Watertown, N.Y. 2

Saw Mill Machinery For Sale

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

Location and Uses of Cypress

Cypress grows along the Atlantic Coast and Gulf of Mexico from Maryland to Texas, and in the Mississippi River valley it extends as far north as Cairo, Illinois, at the junction of the Mississippi and Ohio rivers. It is distinctly a tree of the swamps, and more than 90 per cent. of it is found at an elevation of less than 100 feet above sea level.

Extensive cypress forests occur in the delta of the Mississippi, covering several thousand square miles, and also in some of the large swamps of Georgia and Florida, such as the Okefenokee and the great cypress swamps fringing the Everglades. In some places it occurs where the soil is covered with water for weeks or

months at a time, and in a few places the base of trunk is submerged throughout the year. Usually the lower part of the trunk is heavily buttressed and numerous projections, or "knees," are sent up from the roots, probably as an aid in securing air.

Cypress wood has great durability, which adapts it to many purposes for which some other species are unsuited. Census statistics show that in 1911 over 981,000,000 feet of it were used for lumber, lath and shingles, and that in point of annual consumption it stands seventh among the various softwoods, or coniferous trees. It is one of the few conifers which shed their leaves each winter. It is used for a great variety of purposes, such as tanks, cisterns, columns, exterior and interior finish, railroad ties, poles and wharf piling. It is especially valuable for greenhouse construction.

While cypress wood has so many good qualities, the tree itself presents many problems to the forester. Its rate of growth, they say, is extremely slow, so that the cost of producing large-sized timber is great as compared with that of producing wood from other more rapid-growing trees. Furthermore, it does not readily reproduce itself, and there is some doubt as to whether mature stands will replace themselves after being cut.

It is an open question, according to the authorities, whether it will pay to maintain the species in localities where it now occurs. Much of the land upon which it grows is capable of high agricultural development when drained. Even where it might be reproduced, it is not known how this reproduction may be brought about. It is with a view to throwing light on these important problems that Mr. Mattoon is undertaking the present investigation.

Band Saw Pulley Rims

By N. O. T.

Many users are working their large band saws with saw pulleys having absolutely flat faces, while others advocate and use pulleys having slightly rounded faces. Tests will give most excellent results, it is probable that one is better than the other.

For reasons given below, I believe the flat face to be the better. I am aware, however, that some experienced sawyers favour the slightly rounded style, and they have doubtless very good reasons for their preference, and it would be both interesting and instructive if the readers who may have experience in this matter would give others the benefit of same.

The crown is always very small, the rim of the pulley being turned to a radius of about 20 ft., and it is contended—and with some justification—that saws will

keep their positions better on such a rim than on a flat one.

The disadvantages of the crown-face pulley are that it is necessary to use saws more heavily tensioned than when run on a flat face; this heavier tension also necessitates running the saws more tightly strained than would be required when using flat-faced pulleys; also to make the saws run in their proper position on the rounded face pulley it is necessary to give more cant to the driven wheel than when the flat face is adopted.

It is pretty certain that the above facts explain the greater tendency to develop cracks, which saws run on the rounded faced pulleys have.

Many saw sharpeners have no difficulty in getting up their saws so that they will keep their proper position on a flat band saw wheel, even when cutting at a high speed, although when worn down to about 3½ in. wide there is often a tendency for the narrow saws to run forward and come off; also any sawdust which may find its way between the saw and pulley will cause the saw to have a greater inclination to shift on a flat than on a rounded pulley.

The quality of the sawing is generally found to be rather better with saws got up and tensioned for a flat rim; but this in some cases may only be due to the greater skill of the saw sharpener at a particular mill, although I know of one case where after the crown had been taken off the pulley the sawing was better, and they found fewer cracks in their saws.—Timber Trades Journal.

Overproduction and underbuying must be bed fellows.

**FORESTRY DEPARTMENT**

Review of Current Trade Conditions

Ontario

Stocktaking and holidays have combined to keep the lumber trade on a very quiet basis in Ontario during the past fortnight. No price changes can be noted and no indications of any alteration in trade conditions are apparent, although there is a more hopeful feeling prevalent as to the outlook for spring trade. Hemlock is quiet at about \$20, and spruce mill run is selling at \$20 at the mill. Shingles are quiet and lath are strong and scarce. Southern pine continues to come into Ontario extensively at very low prices.

Hardwood prices are steady and it is hard to say anything definite about trade conditions as practically all the factories are taking stock. Some fair business has been reported of late, however, and there is no question that a moderate amount of good business is going on. The hardwood situation is all right, but there is nothing that one can judge the outlook by to any great extent as yet, because orders are not numerous enough. Stock taking will probably keep the trade quiet for another fortnight.

A heavy fall of snow throughout the Ottawa Valley has improved logging operations to some extent, but much more is still required before ideal conditions will prevail. Trade at Ottawa has improved during the past fortnight and the indications are that there will be a fair business in the spring. Pine s.c. shorts, 1 x 5 in. are about one dollar higher than they were a fortnight ago and mill cull shorts 1 x 4 in., up to 11 ft., also log run basswood have advanced to the same extent.

Edward Clark & Sons, Toronto, Ont., who make a specialty in birch, basswood and brown ash, have this year added another to their excellent series of calendars. For 1914 they have selected a remarkably fine colored painting of a young lady, a study in greens and purples, which is exceptionally striking and effective. The picture is handsomely mounted on gray board and the whole calendar is designed in exceptionally fine taste. The picture, entitled "Elaine," is a reproduction of a celebrated painting by the well-known French artist Dagnan-Bouveret, and has a remarkable history, being the picture of a young lady with whom the artist fell in love, and who subsequently died before he could paint another portrait of her. Accordingly he has flatly refused the most tempting offers for the sale of the picture and only after much persuasion consented to its reproduction.

Eastern Canada

The lumber trade at Montreal is rather slow and there is no noticeable change in conditions. Most of the retailers have been engaged in taking stock during the past fortnight and have not been in the market for new stocks. Supplies of many grades of lumber in Montreal yards are low. Spruce and pine continue firm. Among wholesalers there is a feeling that higher quotations will be made both for local and United States markets in the spring. From many parts of Quebec province, reports of a shortage in the snow fall have been received and there is a general belief that this will result in a similar cut. The demand for lumber for building purposes gives promise of being good during the present year. Trade conditions will depend very largely upon the financial situation. During 1913 the building permits in Montreal made a new high record showing an increase of over \$7,700,000.

Very little stock is now being manufactured at St. John, N.B., practically all the mills being closed with the exception of Stetson, Cutler & Company's, which is sawing 2-in. for the American market and boards for the South American trade. There is very little movement of stocks as owners prefer to hold until spring. Present prices for random are very close to the cost of manufacture. Lath are steady at about \$3 on the wharves at St. John. Stocks are light. Portable sawn deals are a little stronger and are selling at about \$15.25 for 50 per cent. 9 in. and up, the balance 7 in. and 8 in. x 3 in. No city deals have yet been sold for the coming season. Manufacturers are of the opinion that they will do better by waiting until they can form a definite idea of the extent and cost of their woods operations. Men are very hard to find for woods work. Logging conditions are excellent and the indications are that the output will be about general.

The demand for spruce at New York continues quite light. Bill stuff is firm at \$25 base, but random cargoes are numerous and advances in prices are rare. Stocks at New York are much lower than a year ago. Buying continues on a cautious basis, but some improvement is reported. Spruce frames at Boston remain steady at \$25. The demand for random is light and stocks are not too plentiful. More

activity is shown in 2 in. x 4 in. than in other dimensions. Sales are being made at \$22, although a few cases are reported at a little higher price, where extra lengths have been wanted. Two by three is offering at \$21; two by six at \$20.50 to \$21. Stocks of 2 in. by 5 in. are very scarce. They would probably sell at \$20. Other prices quoted are: 2 in. x 8 in., \$22.50 to \$23; 2 in. x 10 in. and 2 in. by 12 in., \$24 to \$25. Sales of these sizes are very scarce. Random spruce covering boards at Boston are offered at \$22.50: No. 2 matched, 12, 14 and 16 feet stock ranges from \$24.50 to \$25. The demand for lath and shingles at Boston has been quiet. Dealers are asking \$3.80 and \$3.85 for 1½ in. lath, but orders are very scarce. The supply of shingles is plentiful. Extra white cedars have sometimes sold at less than \$3.60 of late, but \$3.75 has been obtained for high grade stocks. Clears have been ranging between \$3.25 and \$3.40 and second clears have been selling at \$2.75.

The demand for clipped boards is light, but the supply is low and prices are steady at \$52 to \$54 for spruce extras and \$50 to \$52 for spruce clears. Pine extras are steady at \$55, clears at \$50 and second clears at \$48. Improvement is reported in the demand for hemlock at New York. Retailers' stocks are reported to be badly assorted. The demand for hardwoods at New York is a little more active, but there is still plenty of room for improvement. Maple and birch are strong and can easily be sold at good prices. Maple flooring is steady. At Boston the quotations for hardwoods show no change, but orders are less frequent.

United States

Reports from Chicago state that little change has taken place in lumber trade conditions in that market during the past fortnight. A number of enquiries are reported by wholesalers from country yards, but the volume of orders is small and most of them are of the rush variety. Small country yards are still running on as light stocks as possible and are not doing any heavy buying. Apparently they intend to wait until they know more about the probable nature of business next spring. The receipts of lumber at Chicago during the week ending December 27th amounted to nearly 40,000,000 feet, whereas during the corresponding week of 1912 the total was over 55,000,000 feet. From January 1st, 1913, to December 27th the receipts amounted to 2,783,628,000 feet, an increase of 112,932,000 feet over the corresponding period of 1912. Shipments for the week ending December 27th amounted to 16,238,000 feet, an increase of 1,744,000 feet over the corresponding week of 1912. The total shipments for the year, up to December 27th, amounted to 942,586,000 feet, 54,370,000 feet less than the shipments of the corresponding period of 1912. The northern pine trade at Chicago is quiet, orders being simply for filling old contracts or meeting immediate requirements. Stocks of No. 2 and better are large, but the demand is quiet. There is a good demand for Nos. 4 and 5 box boards and stocks are low.

The holiday season affected the trade in northern pine at Buffalo and very little revival was looked for until the middle of January. Dealers appeared uncertain as to the future of the trade.

Hardwood stocks at Buffalo are in good assortment and appear ample for present requirements. There has been a fair demand for plain oak and some enquiry for a number of other hard woods including birch and maple. No activity is reported in North Carolina pine at Buffalo, but this trade usually picks up soon after the new year. Most of the retailers were taking inventories early in the year and only purchasing small amounts. Some dealers report that a number of the mills are refusing to take new business at former prices and that a further curtailment of output is likely rather than lower prices. Southern pine mills report better prices and light trade on account of the holiday season. Red cedar shingles at Buffalo are a little stronger and some quotations are being made at an advance of ten cents. The demand for shingles has been rather limited of late.

Great Britain

The demand for lumber at London kept up fairly well throughout the month of December, although, during the holiday season it naturally showed some slackening off. The deliveries at London docks ended the year with a very considerable surplus over 1912. For the week ending December 20th the total was 5,935 standards, as compared with 4,356 standards and 4,680 standards in the corresponding weeks of 1912 and 1911 respectively. One of the chief factors in the continuance of the demand is the extensive rebuilding operations which are continually in progress in the more central portions of London. The packing trade has also been very busy and the wood paving demand has continued brisk. A report from London states that shippers

View of Mills in Sarnia.

SARNIA, ONTARIO

B. P. BOLE, Pres. F. H. GOFF, Vice-Pres. E. C. BARRE, Gen. Mgr. W. A. SAURWEIN, Ass't. Mgr.

have lately refused to make any contracts for Quebec yellow pine and elm logs alone, compelling purchasers to take a fair quantity of each, thus driving up elm to a price almost unattainable, and unless a reaction takes place, the report says, there will come an end to the demand for both woods, by other kinds being substituted.

At Liverpool there has been very little actual buying and selling during the past fortnight, so far as the retail trade is concerned. There has been some movement, however, in spruce and pine deals from the quay direct to the railways, which is partly in fulfilment of orders to arrive and partly from stocks on hand. It is expected that the reports of stocks on hand at the end of the year when published, will show a pleasanter situation than some have been inclined to think.

Imports of spruce deals from St. John and Halifax has been confined to small parcels by the winter liners. These are being disposed of at steady prices as they arrive, varying according to specification and quality only. Shippers' quotations have been fully maintained at Liverpool and spot prices have suffered but little by the slackening off of the consumptive request, as importers are refraining from pushing goods, the majority being of the opinion that better results will be attained by carrying their holdings forward. The spruce c.i.f. market continues dull, dealings being confined to minor sales of liner consignments at unchanged prices. Offerings for future delivery are absent and the spot market is flooded, orders being of a retail character. At present there are no indications of widening in the demand.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

Montreal Trade Expecting a Good Year

Montreal, P.Q., January 10th, (Special to the Canada Lumberman):—There is no appreciable change to report in conditions. Trade is rather slow, particularly for retailers, who have been mainly engaged in taking stock. Supplies of many grades of lumber in the Montreal yards are low. The market for spruce and pine is firm, and it is reported that the mills manufacturing spruce deals for export to Great Britain are asking higher prices. Some wholesalers are of opinion that with ordinary conditions, quotations for lumber both for local and United States markets will advance in the spring.

Owing to the small fall of snow, in the province of Quebec, logging operations are restricted, and appearances point to a smaller cut.

Prospects for the present year are fairly good. There is certain to be a good demand for lumber for building purposes, and if the monetary situation is favorable, schemes which have been held over will be proceeded with. So far as 1913 was concerned, the building permits were, in value, the largest ever known. They totalled \$27,408,000, an increase of over \$7,700,000, which was almost entirely due to gains in the last six months. The total does not take into account Westmount, Maisonneuve and Verdun, which form part of Montreal, but whose building does not figure in the values owing to the places having separate municipal governments. In three years the amount of building in Montreal proper has increased \$12,252,000.

Ground wood has been bought freely for account of the United States, and more pulp has been exported during the last three months than in any similar period in the preceding three years. All fresh ground pulp is being steadily marketed, while some of the stocks on hand are also being considerably reduced. There are still three mills with large stocks, but in the severe climate of the Province of Quebec, storage of this wood outside will prevent its being loaded very fast. Therefore any fresh ground wood is at a premium, and this condition will probably create a shortage before spring. The Donnacona Company will start their mills about January 15th with a production of 50 tons of news print and 30 tons of ground wood per day.

The news print market is satisfactory. A Canadian view of the situation in the United States is that a decided improvement has taken place recently, and that in a short time a more pronounced revival in business will be apparent in all grades of paper. This will undoubtedly help the sale of Canadian pulps.

The chemical market is fairly good. Some good orders for the United States have just been received by Canadian mills.

Ottawa Trade Showing Improvement

Ottawa, January 6, (Special to the Canada Lumberman).—The recent fairly heavy fall of snow throughout the Ottawa Valley has helped along operations in the lumber camps to some extent, but not as much as desired. If a good output is to be secured there will have to be much more snow and frost to facilitate logging in the woods.

Within the past week there has been a noticeable improvement in the trade. A canvass made of several of the leading lumbermen here elicits the information that prospects are shaping for a fairly good run of business in the spring. There have been a few alterations in prices lately. Pine s.c. shorts 1 x 5 in. have advanced \$1, and mill cull shorts 1 x 4 in. up to 11 ft. and two grades of basswood log run have also gone up a similar amount.

According to the custom followed in other years, the Estate of James Davidson closed down at Christmas time for two weeks, so that the machinery in the woodworking plant could be overhauled and repaired.

The Royal Commission recently appointed to investigate the cost of living in response to a widespread agitation, will, it is learned, in-

quire into the causes which have sent the price of lumber up to a high plane. However, as it is generally understood that higher prices in lumber are due principally to conditions over which lumbermen have no control, it is not likely that the commission will need to probe very deeply into the matter.

Mr. E. P. McGrath, managing director of the Greater Ottawa Lumber Company, was a candidate for the board of control in the civic election here which closed yesterday. He was defeated by a small majority.

Mr. J. R. Booth, who was injured rather seriously some time ago, is making good progress towards recovery. Every fine day he spends a few hours on the verandah of his house. It is expected that he will be able to be around again in a few weeks' time.

New Brunswick Loggers Having Good Winter

St. John, N.B., January 6th (Special to the Canada Lumberman): The manufacturing end of the lumber business, in so far as this city is concerned is about at a standstill, with the exception of Messrs. Stetson Cutler & Company, who are running their two mills, sawing largely two-inch for the American market, with a large quantity of boards for the South American trade. Insofar as shipments are concerned, very little stock is moving forward to the American market from this port. The manufacturers who have anything, prefer to wait until later in the season and ship on the early spring market, when the demand as a rule increases. At the present time, prices for random stock leave very little margin for shippers of American stocks. The supply of sizes for the American market, is practically all in the hands of Stetson Cutler & Company at this port, and is probably in the vicinity of ten millions. Laths are steady at about \$3 per M. on the wharves here, but stocks are light, as any shipments taking place, from this point of late have been laths instead of long lumber, for American ports. It is hard to set a price for long random for the United States trade, as buyers are hard to find who will take any cargoes of an extensive size. What stock is moving here is largely car stock, shipping through here from interior points, being sawn by rotary or portable mills in the woods and hauled to cars. Very little if anything can be said of the English market, some stocks are going forward by liners but shipments are not necessary. Prices are steady. If anything they show an improvement from early fall, especially with regard to portable sawn deals, which have probably advanced from a low level, to the same prices as paid for them in the fall of 1912-13, viz., about \$15.25 for specifications running 50 per cent. 9 in. and up, balance 7 in. and 8 in. x 3 in. No sales of city cut deals have yet been made for the coming season and it may be said that the manufacturers will undoubtedly wait until they see how their woods operations are coming along. Men are extremely hard to find for woods work, all over the province, and the cut of logs will only be normal, should the ideal conditions for lumbering remain as they are. Any less snow will reduce the cut of logs to below normal. Prices of labor, supplies, etc., are higher than in 1912-13, and it is felt that prices for logs will be higher than last year.

The building trade is about at a standstill, no new buildings, if any, will be started until early spring. The work of finishing up the old contracts is about through.

The Woodstock Lumber Company of Boston, Mass., have opened an office in the Canada Life Building, Prince William Street. We wish them every success as they enter into competition for the American product from this port and interior.

Conditions for lumbering are ideal all over the province, snow being to a depth of from 6 inches near the coast to 18 inches farther inland, and the work of hauling logs to rivers is now being carried on in good earnest.

DRY SPRUCE BOARDS

WE have them and can ship promptly now, but cannot promise to do so later because the annual car shortage will be with us.

¶ We have the largest stock of dry Spruce boards in Canada. Our assortment is now complete, but with the volume of orders we are receiving we will be short of certain items before long. If you are going to need Spruce boards this Fall, order early and make sure of having them when you need them.

¶ When ordering get the best,—the Silk Finish kind,—from the most reliable source, from the people with the most up-to-date dressing mills, the most efficient service.

Wm. E. Hill Company's Products

The products manufactured by Wm. E. Hill Company, Kalamazoo, Mich., include complete outfits for sawmill's and wood cutting plants. The company is so well known as manufactures of the "Hill Steam Niggers" that they wish to draw particular attention to their other lines of machinery as well. Their special line of wood cutting machinery is of much interest and includes several types of steam drag saw machines for cross-cutting logs, steam dogs for holding the logs while being cut, and an extensive line of steam splitters both for 4-foot wood and block wood, any diameter, together with fibre stock for pulp mills. One of their products which is in specially strong demand is their spike concave rolls for bringing logs to the saw. They also furnish steam and hand ratchet rigs for those who prefer them.

In addition to the above lines, Wm. E. Hill Company manufacture vertical automatic centre crank engines from three to twenty horsepower inclusive, suitable for driving filing room machinery, fans, blowers, dynamos, etc.

Their advertisements will appear in subsequent issues of the Canada Lumberman and will be interesting and instructive to any of our readers who wish to install machinery of the above nature. The company have been in business continuously at Kalamazoo, Mich., since 1881. From that date until 1912, it operated under the name of Wm. E. Hill & Company. The business was then incorporated under the name of Wm. E. Hill Company, by which it is still known.

Motor Headworks for Boom Towing, etc.

Russel Bros., Fort Frances, Ont., have designed and placed on the market a small, strong, high-power gasoline boat, built of the choicest timber, to take the place of "head-works" or "floating platforms" for "horse-capstans," in connection with logging operations carried on by lumber and pulp companies. The old method is an expensive and difficult one to handle and Russel Bros., claim for their "motor-head-works" that it eliminates much of the cost and trouble in connection with this work. It is the outcome of many experiments with a view to obtaining the greatest amount of power per floating weight. The construction is light, simple and so durable that the cable will part before the boat or machinery will give way. This displacement is about 8,000 pounds, and with a 30 h.p. engine, the machinery will exert over 2,500 h.p. pull on the cable. When running under propeller, the boat makes from six to seven miles an hour, and is a very powerful tower. The hull is constructed of white pine, oak and tamarac, barge style, the sides being 4-in. thick, bottom and ends 2 in. and sheathed forward with steel. The length is 30 ft. over all by 7 ft. beam, 24-in. draft and from 14-in. to 24-in. freeboard, with an 8 ft. deck fore and aft. Two 4-in. x 6-in. tamarac metal sheathed skids run from bow to stern and are used as runners when portaging. They also extend aft beyond the propeller and rudder, protecting them when running among logs or jumping booms. The cabin contains a folding bunk for the engineer.

Near the front of the cockpit is a drum holding 2000 feet of half inch steel cable, which is connected by a powerful chain of steel gears with the forward end of the engine shaft, through a friction clutch. The gears provide 4 changes of speed and the release of a positive clutch in the drum head permits the cable to be run out free from all gears. Keyed securely to one end of the drum shaft is a "niggerhead" which turns with the drum or independent of it and from which a line may be used fore and aft. An automatic interlocking device prevents the gears from being changed when power is on. Power cannot be applied when the gears are not fully in mesh. Thus there is no danger of stripping. The arrangement of steering wheel and levers is such

that only one man is required to handle the boat when running under propeller or cable power.

When a "shore hold" is not available, a 250-pound patent anchor is used. The engineer will run approximately 2,000 feet from his tow, drop anchor, return and couple tow to tow post, then wind in on cable at whatever speed he considers advisable.

It will be seen that this "motor-headworks" is of great value around a mill boom. Its chief advantage is the relatively low cost of operation, as compared with "horse-headworks and anchor boat."

A "motor-headworks" only requires four men; an engineer, two logmen and a cook. When a rapid has to be passed it can run any that are passable or it can portage itself if necessary. It is of light weight and can be loaded on a tote sleigh and taken into the head waters or small lakes at very light expense. Its crew consists of one engineer, one fireman, one wheel man, four logmen and one cook. Its advantages briefly stated are that it requires less stores; needs no wood barge; involves no time lost in "wooding up;" is lighter to portage; can be carried on a tote sleigh and involves no lost time in getting up steam.

Small Lumber Cut on the Nashwaak

The lumber cut on the Nashwaak River in New Brunswick this winter will be the smallest in half a century, according to reports from the camps. In years gone by the cut on the Nashwaak has ranged all the way from eighteen up to thirty odd million feet of logs, but this year it will not exceed four million feet. Alex. Fraser, who has operated on the Nashwaak for years, will take out upwards of half of the total cut this winter, while Justus Manzer and Angus Urquhart will cut the balance. The curtailment of the Partington Company's operations on the Nashwaak this winter is due to the fact that practically their entire cut of last year was hung up last spring in the streams and did not reach the mills. Mr. Fraser reports said that conditions for carrying on operations had been favorable so far this season.

Inspecting Stanley Park Timber

Mr. G. H. Edgecombe, a British Columbia provincial forestry expert, has commenced an inspection of the trees in Stanley Park, as a result of the representations made by the Park Board to the provincial department, seeking a report on the diseases affecting the trees, as exposed by Dominion tree pest inspectors recently. The Dominion forestry department also intends to send out an expert on tree diseases in a short time, who will make a report to his department. The Park Board expects to be able to take decisive steps in dealing with tree pests, upon receipt of these two reports.

One of the largest lumber cargoes ever shipped from Victoria, B.C., has been placed under charter for the American ship Aryan for February, loading at the Inner Harbor mills of the Canadian-Puget Sound Lumber Company. The Aryan will load 1,750,000 feet of British Columbia lumber for Delagoa Bay, South Africa. There has been an extensive movement in lumber in recent months from Victoria to South Africa. The announcement of the charter of the Aryan comes almost simultaneously with the departure of the American schooner Inca, which completed loading 1,250,000 feet of lumber at the Inner Harbor mills for South Africa.

The B. Grenning Wire Company, Hamilton, Ont., have sent out an attractive calendar containing a colored illustration of their large plant and offices. The calendar pad is large and the type is especially suited for office purposes.

THEIR ORIGIN, VALUE AND
USE—COMMENT AND VIEWS
ON AN IMPORTANT BRANCH
OF THE TRADE.

Foreign Veneer and Panel Manufacture

By J. B. B. Stryker*

I have been asked to make a comparison of American and European methods, as applied to the veneer and panel manufacturing industry. While not a manufacturer of these products myself, I have come more or less closely in personal touch with factory conditions, etc., in America and certain European countries, namely, England, France, Austria-Hungary and Germany. So I will give the conclusions on this subject which I have reached as the result of observation on the ground.

I fear that, in one respect at least, this paper will not afford the help which I desire it to. This refers in particular to the fact that in my visits to veneer, panel, furniture and kindred plants in Europe I observed but little having to do with mechanical methods or preparation of veneer, stock, etc., or of construction which I can present as being an improvement on the methods of American manufacturers.

When it comes to the question of the finished product we must admit that much of it shows up exceedingly well, in fact, better than ours.

The cutting of veneer and the manufacture of panels, tops, etc., in Europe, dates back much farther than it does in the United States, and this is only natural, the age of our country and theirs being considered. However, to-day, the United States leads Europe in the number of plants in operation, the amount of output and the general magnitude of the business. In France, for instance, veneering has been done for hundreds of years, but instead of being carried on as they are now learning to do it, it was done in a very small way indeed. Where veneered lumber was desired, the small cabinet maker would cut his own veneer; the product he then obtained should be more properly called by the name of thin lumber. Two men were employed in the operation, the log being placed with each end on a high saw-horse or platform, and the veneer sawed off by hand, one man under the log and one above, pulling the saw up and down much after the fashion in which two-man cross-cut saws are operated in our timber camps to-day. This method may even yet be seen in use in remote localities over there.

To-day there are some veneer and panel plants in almost all the countries of Europe, Russia undoubtedly leading the list in the number of plants being operated and the amount of production, followed by France, Germany, Austria-Hungary and England in the order named. Italy, Belgium and some of the other smaller countries do something in this line also, but little is being done in Spain, I believe. Russia ships her product to the other countries of Europe, large quantities going to France, and to England particularly. Although I did not see the plant myself, I was told on very good authority that one Russian concern had nine American veneer lathes in operation in its plant. Speaking of shipments being made from one European country to another, as freight rates are considerably higher over there than they are in the United States, it occurred to me that England should offer a good market for American manufactures. That country being a free trade country, except on a very few commodities, and with no duty on the commodities under consideration, it seemed to me that a plant on the United States seaboard might be able to do a considerable amount of business in England. Bear in mind in this connection that all timber products consumed in England must necessarily be imported from abroad, there being no native timber supply in that country. I was greatly impressed in Liverpool when I saw the immense stocks of mahogany logs which were carried by the dealers in that city. For six or eight blocks along the river front mahogany logs were piled to a height of twenty or thirty feet. These were in the yards of different dealers and the logs were auctioned off piecemeal to the highest bidder, the idea being that in disposing of them in this manner the best prices would be obtained, as each log would bring the most it was worth.

I judge the American manufacturer is most interested in methods for obtaining better veneer and panels, or cheaper methods of manufacturing them, or both, when they can be both obtained in combination. While much that is produced in these lines in Europe shows up very well, it is not produced as cheaply as it can be produced here, this in spite of the fact that labor over there is much cheaper than here. The average European workman, while steady and conscientious in the carrying out of his work, does not seem to admit of the speeding-up that the American does.

As evidence that the American manufacturer is in advance of the

manufacturers of Europe, I would cite the fact that in the largest and most progressive plants over there machinery of American design and manufacture is in evidence almost everywhere—veneer lathes and appliances, trimmers, dryers, taping machines, glueing appliances, sanders, scrapers and much machinery of a kindred nature. I have been in a plant in England, for instance, which is engaged in the manufacture of phonograph and talking machine cabinets, and in furniture factories in Vienna where I have seen so much American machinery on all sides that it made me homesick. The hydraulic press has heretofore been used to a large extent over there than here, but they are now adopting it as time goes on, and those of American make seem to again have the preference. Furthermore, in many instances where machines are not American made, they are such a good imitation that it seemed to me they were modeled as closely after our own as it was possible to make them.

Naturally with so much American made machinery and appliances in use in their plants their methods must rather closely conform to our own. During the past few years I have known of numerous instances where Europeans have come to us for ideas and methods, but I believe it is a rare thing for us to go to them with the same object in view. Although American made or modeled machinery is so largely employed by them, the production of the average plant, comparable with ours as to size, equipment and number of men employed, falls considerably short of the production turned out here. In addition to veneer and panel plants, I visited several factories engaged in quite different lines of manufacture, and my impression gained thereby was that the American manufacturer, given an equal investment of capital, will generally turn out a considerably larger production. The European manufacturer, regardless of the particular line of work in which he is engaged, is very apt to give more attention to details, and there is more time spent on details than usually prevails in the average American plant.

They prepare their logs much as we do, usually boiling or steaming them. The cutting of the veneer is the same, as is the subsequent drying also. In Austria-Hungary and Germany the alder is largely used for core stock. Five-ply work is usually laid up in the same manner as here, but in Vienna, which in Austria is considered as the home of fine furniture (and some beautiful work they certainly turn out), I saw Circassian and mahogany tops laid up three-ply, the veneers being laid on three-fourths-inch or seven-eighths-inch alder cores, sometimes with the grain and sometimes across the grain. I believe that the American manufacturer usually considers that high-class work of this nature can be done only by the use of cross-banding. I should say that the preparation of the veneer and the building up of same into panels, tops, etc., in the white, was no better than here, but the finish they put on their work in many cases excels ours. Labor being cheaper, they can afford to spend more time on this part of their operation. As one Austrian long in the business expressed it to me, "It takes the human touch to get the right finish." While I am unfamiliar with the materials generally used for finishing purposes, both here and abroad, I understand that at some points in the finishing process they use materials little, if ever, used in this country. The deep appearing finish which they obtain, I consider, is very pleasing to the eye. Beech is used largely in France in the making of panels, as it is a comparatively cheap wood in that country. To-day three-eighths-inch veneered panels are in demand there for use in places where they before have been in the habit of using thin, solid lumber, as much trouble was encountered with the latter on account of splitting.

In Germany quite a business is maintained in the manufacture and sale of "wood plates," as they call them. These are made up three, five and seven-ply, being about three-fourths, one and one-fourth and one and three-fourths inches thick, respectively. These are made up to as large as six by twelve feet and sold for various uses, such as beds of printing presses, billiard tables, etc. The large sized plates are oftentimes bought by the users without regard to the particular purpose for which they are to be used, and they are then cut up into different sizes as required.

In London there is a panel factory which struck me as being unique. In this plant there is not a single power driven machine, the reason being that there is a law prohibiting the use of any power driven machinery in the district in which the factory is located. In making panels they place the centre stock on the floor and the glue is applied by hand with a large brush. This plant presented an instance of modern and obsolete equipment in that it had several hydraulic presses which were worked by a hand pump, while, on the other hand, the glue was kept in condition by placing the bucket in

Montreal West, P.Q.

which it was contained over a gas flame. The method of handling resulted in a great deal of blistered work, which was repaired by placing a wet cloth over the blistered portion and then running a hot flat-iron over the wet cloth until the veneer was stuck down.

In Germany I saw a veneer clipper, a description of which may be of interest to some of you. It is built along the lines of an ordinary veneer clipper, but it is very much more powerful than those ordinarily used in the United States; the knife comes down very slowly on an angle of somewhat less than forty-five degrees. This machine clips the ends off from a whole flitch of sliced veneers at one time and leaves so clean a cut that the ends can be spliced into a perfect joint. It is used for cutting the veneers to proper length and width, and also for jointing veneers ready to splice. The splicing is done by young girls who tack the edges of the veneer to a board and then stick a strip of gauze tape over the joint. On the tops turned out by this concern cross-banding and back veneers used are nearly all one-twenty-fourth-inch poplar, with a very small proportion of such sliced oak veneers as are not good enough for face stock. The face veneers used are sliced one-twenty-eighth-inch black walnut and plain sliced one-twenty-eighth-inch oak. All five-ply work is glued in two operations, that is, the core is first veneered with the cross-banding and when this comes out of the bales in which it sets over night it is put on sticks and left to dry out for six days. It is then taken to the sander where one-half of the cross-banding is sanded off, thus leaving the cross-banding about one-forty-eighth-inch thick when the face and back veneer are put on. When this is finished it is left on sticks another six days before the face and back veneers are sanded. Upon inquiry it turned out that the main reason for glueing-up this five-ply stock in two operations, and giving it the twelve days' drying out, was that, inasmuch as the operators wished to lay up the veneer slightly damp on the theory that it would lay flat, and cause less trouble in splicing, there would be less likelihood of the finished work drying out and checking afterwards.

In Austria I saw a machine which to me was something new. This was a miniature lathe, specially constructed for the purpose of turning down the cores from the large lathes. These cores, of an original diameter of from five to six inches, were placed in this small lathe, or "coffee grinder" as the owner of the plant called it, and turned off until a core of only about one and one-half or one and three-fourths inches diameter remained. The veneer produced by this small lathe was naturally not of a quality suitable for anything outside of core stock, to be used on the cheaper grades of panels, etc., but for this purpose the veneer thus recovered, and which ordinarily would have gone to waste as cores, answered the purpose just as well as veneers cut from the original log.

In making any sort of comparison whatsoever between American manufacturing plants and methods and those of Europe it should be remembered that, generally speaking, manufacturing operations are carried on in this country on a much larger scale than they are in Europe. Of course manufactured products of all kinds are consumed in Europe, as a whole, in great quantities, but these commodities are usually turned out from factories having a smaller output than ours, the result being many factories with a small output rather than a relatively smaller number of factories with larger outputs. This has a tendency to allow of much closer supervision, wherein the personality of the workman or operator can be made to enter. The wages paid in Europe vary more or less for the same class of work in the different countries. England undoubtedly heads the list in this respect, followed by France, Germany, Austria-Hungary and Russia in the order named. It is no uncommon sight over there to see the father and mother and all the children working together in the same plant, but it struck me as entirely new and novel to see women working as hod carriers and railroad track laborers.

We are very apt to complain of high taxes, but as compared to taxes in the most of Europe ours are exceedingly reasonable. For instance, I was told by an Austrian manufacturer that the government expected ten per cent. in the way of taxes, based on the net profits yearly realized from his business, and that they were supposed to pay 25 per cent. yearly of the gross income realized from any property owned and rented by them to other parties. In answer to my inquiry as to whether or not this excessive rate of taxation was actually collected, and if not, what was done about it, he smilingly replied that in Austria the citizens paid their taxes the same as they did in America. As this gentleman had visited America on several occasions, I had nothing more to say on the subject. I cite this instance in regard to the rate of taxation simply in order that, when things seem to go wrong, you may have the satisfaction of remembering that there are other people who are not so well off as we are.

The sum total of the impressions which I received by reason of coming in contact with the European conditions and manufacturers was that they would follow the lead of American manufacturers so far as the veneer and panel business was concerned, and they are quite willing, I believe, to acknowledge this fact. Furthermore, it behooves us to remember that they are very apt pupils.

Beech Becoming Important As A Veneer Wood

The use of beech as a veneer wood has been very largely confined to the production of material for various kinds of baskets and for plain veneer work. It has not entered into veneer proper as extensively as it might and has not been regarded as a face wood to any appreciable extent, although at times it should prove quite attractive if properly finished. A bulletin, recently issued by the Department of Agriculture at Washington, states that beech ranges from the Gulf of Mexico into Eastern Canada and that the estimated quantity available for use is between 10 and 20 billion feet.

Beech is one of the hardwoods that the pioneers did not find much use for because it would not split readily into rails, more plentiful than the supply of other woods, and practically everywhere it has been held in low enough esteem that beech logs are purchasable at cheap prices as compared with other timber. Since the extensive development of creosoting wood to preserve it, there has been more demand for beech for railway ties and this has taken out some of the stumpage. There is, however, quite a supply of beech available for basket and veneer work and it is used in fairly good quantities in basket making but not to the extent it might be for veneer making. Neither do the manufacturers of veneer from beech seem to realize that there should be a chance to use it for face work now and then.

Here and there one can find some solid beech lumber used for house trim and it finishes off beautifully. It shows up well enough and it seems remarkable that we have not had more of it used in table tops and flooring. Also for paneling and in millwork because curly beech is pretty closely related in appearance to curly sycamore, and the sycamore is sometimes sought after for the beauty of its figure in face work. In the matter of plain veneer and panels, beech is said to be particularly good for drawer bottoms. The best drawer bottoms these days are from three-ply veneer built up, and in this work experienced veneer and panel men say that beech gives splendid results—indeed some have expressed the opinion that it is the best wood for drawer bottoms available.

Good for Drawer Bottoms

There are some specific reasons for the good quality of beech for drawer bottoms and other panels, and one of these is that it is hard, firm and stiff. It is one of the stiffest woods going, therefore a comparatively thin panel of it will strongly resist bending. This makes it a splendid wood for chair bottoms and it is one of the things that makes it valuable for drawer bottoms. Also it should make it a very desirable wood for the large three-ply thin panels used in the packing cases in the east. Another important quality in beech is that after it has once been thoroughly dried out it will not absorb much moisture. Stating it another way, this means that it will do but very little shrinking, swelling or warping after it has once been thoroughly dried. This is a very desirable quality in all cabinet wood, and it is especially desirable for certain kinds of work. That is why beech is extensively used for table slides and wherever slides are called for in furniture or cabinet work. It is hard and smooth and is not inclined to absorb moisture and swell.

That is one of the reasons it is a valuable wood for drawer bottoms. It will keep its shape and retain its dimensions and just fit snugly into its groove and give satisfaction in service as well as in appearance when first put up.

It will be seen from the above that basket manufacturers have attractive opportunities for developing markets for beech veneer products and thus getting more profit out of their lumber. The basket manufacturer who has a greater cutting capacity than is required for the factory itself, should be able to develop a market for beech veneer to be used for panels or for building up into panels and also for drawer bottoms. Some beech veneer is quite attractive enough to be used as a face wood in cabinet work and it seems likely that a recognition of this fact could be secured, if those interested would submit some good stock and have it finished in such a manner as to show its attractions.

The wide market for beech veneer for boxes, baskets and cratings is remarkable. In the city of Maine for instance, a thin veneer of beech is made especially for the Sicily, orange and lemon box trade. Beech, while a little heavier than some woods is so stiff that it can be used in comparatively thin woods and give good results in light baskets. Beech is used for drum hoops, embroidery hoops and rims of various kinds, many of which can be made by a veneer process. It is an excellent wood for picnic plates and for various uses in wooden ware. The public is commencing to realize this fact and the time is opportune for basket manufacturers who are using beech to realize that there is probably more profit to be secured from beech to-day than in the past. Makers of filing cabinets and sectional book-cases appreciate beech perhaps more than the average furniture manufacturer. The principal fact brought out by the bulletin referred to above, is that, as a veneer wood, beech should have a much more important place in the future than it has in the past.

Read that phrase in the circle again,
and remember it because it makes a big
difference in regard to your belting expenses.

Estimating and Making Prices for Millwork

By John P. Larson*

Perhaps one of the greatest evils and one least understood by the different estimators is the pernicious habit of basing their bids on a low grade lumber, with a corresponding price, without taking into consideration the great amount of waste which must be cut out of such lumber on the one hand, and the greatly increased labor charge on the other. No. 1 shop lumber is bought to cut 60 per cent. clear for shop purposes. If the price of shop is \$30 per thousand, and you require one thousand feet clear cuttings for sash and door purposes, it would be necessary for you to bring in 1,670 feet of this lumber, which would cost you \$50. You can get the same amount of cuttings out of one thousand feet clear lumber, which will cost you less than the 1,670 feet shop lumber costs you. Of course you may be able to get something out of the 670 feet waste in the shop lumber, but to offset this it will cost almost twice as much for labor to work the 1,670 feet shop as it will the 1,000 feet clear.

For two-sided work, such as sash, doors, panels, etc., the price of clear lumber should always be used in estimating, because even if it is cut out from lower grades, it will cost as much in the end. For casings, base, mouldings and other lineal stuff, nothing below a grade of lumber which is clear on one side the full length of the piece can be safely used.

Then, too, it must be remembered that even where clear lumber is used, there is a large percentage lost in cutting. Here is one of the pitfalls of estimating. It is doubtful if under the most favorable circumstances it is safe to figure less than 15 per cent. waste in soft woods of good quality. Of course, this waste is greatly increased in the case of hardwoods, where both lengths and widths are less desirable, and here the waste will probably average from 25 to 35 per cent., based on a clear grade of lumber. This, of course, does not take into account, when lumber is selected with a special purpose in view, where waste in cutting may be eliminated altogether. But in such cases either the selection will cost more money, or it will depreciate the remainder to such an extent, that it will not affect the general result.

Waste As An Element of Danger

To show just how dangerous this question of waste really is, I will cite you a case in our own experience not very long ago. We had an order for a lot of casings, in plain red oak. It was a special order, and looked very innocent and very desirable. It was all to be run of one pattern, one width, and nearly all of it of one length. There were five or six hundred pieces altogether. The dimensions were $\frac{7}{8}$ x 8-6. The net amount of lumber in the order, as I remember it, was about 3,500 feet. We had to bring in between 7,000 and 8,000 feet of lumber to complete that order. Of course, there were some cutting left over, but you can draw your own conclusions as to their value.

You will therefore readily see that the initial cost of the lumber while important, is not more so than the question of waste. If an article after being manufactured contains a certain number of feet of lumber, it is surely a dangerous thing to base the price of such an article on the net feet of lumber it contains. Rather it should be ascertained how much lumber was required to do the job, before the waste was taken out of it.

The average mill man (either estimator or owner) is the original optimist. Were this not so, they could not expect to get through with the prices that are being put out—and live. Someone has said that his idea of an optimist is the man who thinks he can make a living out of four hens and a back yard 10 feet square. But I want to tell you in all seriousness that this man has a better show to make good than we have at the prevailing prices of millwork.

Estimators Have Much to Answer For

As estimators you have much to answer for. Did it ever strike you that your particular mission here is to make money for the boss? You are not doing it. Are you preserving what he has? I doubt it. If the millwork industry was ever entered upon for the purpose of making money, it has been forgotten long ago. Everybody connected with it seems to have gotten out of the habit. That gain should have any place or be reckoned with in any way in our business seems to have been overlooked altogether. Your efforts at the present time are not directed to making money for your house, but to prevent the other fellow from getting the business. If your concern would turn over to you its cash-box and bank account amounting to a few thousand dollars, very likely it would be taken care of, conserved, and a strict account of it given. When that same concern turns over to you its lumber yard, its factory and pay roll amounting to say \$50,000 to \$100,000, or even upwards, a year, are you ready at the end of the year to render an account of your stewardship? And will your master be in position to say, as did the master of old, when his servant brought back to him the pound originally entrusted to him with two pounds added there-

unto,—“Well done thou good and faithful servant; you have been faithful in small things, I will make you ruler over many things.”

But you are not to be blamed for all of our ills. The employer is equally guilty. The man who allows his business to be carried on at a loss is a poor manager. However, it is a part of your duties as estimators to prevent the taking on of unprofitable business. You should know whether or not a certain job is profitable. If it is not, then you should oppose with all your might the submitting of a bid which, in your opinion, is too low, and I doubt very much if your employer will persist in putting out a bid over your protest. You can often make more money for your concern by refusing business than by accepting it, and yet how many of you have the courage to do this? In fact, there is no courage anywhere. It is craven fear at every turn, and you fear each other, most of all. You suffer the agony of fear every time a bid is submitted, either because you fear you are not low enough to be lower than every body else, or that you are so low as to make yourself ridiculous. Profit has no place in the calculation. Alas! how often after a long hard struggle and much scheming, you have been enabled to find out the lowest bid on a certain job, and your standing was such with the contractor that he allowed you to put in a revised bid below the lowest and you “brought home the bacon,” and swelled up with pride and self-satisfaction because you have put one over on the other fellow. But did you really put it over? Could it be positively known, the chances are that you were the fellow that was taken in, and that instead of bringing to your institution a live thing, you have brought a corpse—a deadhead, whose gruesome visage grins in derision at the efforts of foolish men.

I have seen within the past few weeks the two highest officers of one of our mills go together to plead for the securing of a contract which they themselves admitted would yield no profit, and which in the opinion of many was below cost. Conditions like these are deplorable. It lessens the dignity of our business and robs us of our self-respect. These conditions have not only been created by ourselves, but are being perpetuated and intensified.

It is up to you to change and better these conditions. The employers must co-operate with you. It is nothing less than a crime, with millions of dollars invested, men employed and families dependent for their daily bread on the success of the enterprise, that we allow conditions to remain as they are. To say there is no remedy is idle talk. There always was and is now a chance to make money in the mill business. It is fear and greed that stand in the way. Fear of your competitor and greediness in yourself. You must change your methods. Instead of destructionists, you should become constructionists. Your own future depends upon it. Are your salaries increased from time to time? I will answer that question myself by saying that they are not. The reason is plain. The mill owners cannot afford to raise salaries. The blame for this must to a large extent be laid at your door. A salesman (and you are the salesman for your output) fixes his own salary. If he can show that he is making money for his house, he can dictate his own terms.

More Than Salesmen

Then, too, you are more than salesmen. In some cases you are the sole representative of your house. This should be borne in mind. You should fit yourselves to take the places, some day, of the men you now serve. This you can only do if they succeed. Their success means your success.

Many of you have endured long years of service, have made many sacrifices in the line of duty, have given liberally of your own time and effort, and yet you have not materially bettered yourself financially from year to year, nor have you advanced the fortunes of your employers to any marked degree. The reason you have not bettered yourself is that you have not put your employer in position to do so. Both have failed to reap the fruit of their labors. You have, indeed, sown, but from the seed put forth you could not expect to reap benefits either for yourselves or others.

I have indicated some of the evils in our business and have hinted at their remedies. If some things have been said which seem harsh and which should be laid at the door of the owners and managers, rather than at yours, they have at least been said in the spirit of kindness. I am convinced that our troubles are due largely to a lack of education, true insight and grasp of the situation.

At a meeting of the Council of the Montreal Board of Trade, held on January 7, a communication was read from the Montreal Lumber Association, calling attention to the fact that, although the Transcontinental Railway is almost completed, Montreal has as yet no direct connection with that railroad, and asking the Council once again to take up the matter with the Government. It was pointed out that Montreal interests have suffered and will continue to suffer serious disability until a connection has been secured by the most direct route possible. The Council, which has previously pressed this matter upon the Government, will again take up this question.

* Address delivered before the Estimator's Club of St. Louis.

One Key to Success is Action

A concern may have all the attributes and yet fail in obtaining their full measure of success.

The Dominion Box & Package Company, Limited

owned and controlled by

William Rutherford & Sons Co., Limited, Montreal, Que.

listened to the story of the Linderman Dovetail Jointer, recognized its possibilities, investigated its daily performances and then acted. After five months' trial they acted again.

So that each day in the week they are saving over ten dollars for each machine.

Read what they say—

DOMINION BOX AND PACKAGE COMPANY

LIMITED

MONTREAL, CANADA

June 25th, 1913

Messrs Canadian Linderman Co., Ltd.
Woodstock, Ontario

Gentlemen :—

Answering yours of June 23rd. regarding the matter of Economy in the use of your machines would say that it is pretty early yet to make any definite statement as to the ultimate saving by this process. The gross saving in our case amounts to about \$4.00 per day in labor and about \$4.00 or \$5.00 per day in lumber per machine, not to mention of course the very superior job which we secure and the fact that we can have solid stock of any size at any time. What our net saving would be considering the repairs necessary as against the groovers and squeezers heretofore used, we are of course not in a position to say at this time. If the 8' machine operates as continuously and satisfactorily as the 4' machine has done we are inclined to think that the repairs and replacements on the Linderman Machine would be about the same as upon the groovers and squeezers replaced by them.

We are sorry that we cannot give you more definite information, but you will realize that it is a little early to quote exact figures. In any case, however, we are well pleased with the process and the results and intend to make these figures safe or better them by eternal vigilance in the matter of maximum output and minimum repairs.

Very truly yours,

C. B. FULLER, JR.

Superintendent.

Skepticism is a good thing when used in moderation but when kept up too long prevents real success.

You can increase your profits ten, twenty or even thirty dollars a day. May we show you how?

Canadian Linderman Company, Limited

Muskegon, Mich.

OPPORTUNITIES

WE own and offer for sale on attractive terms a few especially well selected tracts of timber running from 50 million to one billion feet that are ready for immediate operation, having a good local demand at high prices.

The timber on the Pacific Coast is the last stand of the great forests. Well selected timber in British Columbia is the best investment on this Continent and offers especially attractive inducements for manufacturers.

For further particulars, address

Board of Trade Building, MONTREAL

MERRITT MFG. CO., Lockport, N.Y.

Veneer Machinery

THE "MERIT" LINE of Veneer Cutting, Dimensioning and Drying Machinery is designed first, for veneer mills cutting high grade furniture and commercial veneer from expensive timber, and second, for basket, crate, box and barrel factories using cheaper veneer cut from the less expensive woods.

Merit Veneer Lathe

In addition to Lathes, Clippers, and Driers, the line, includes Knife Grinders, Log Hoists and Trolleys, a set of Crate Head Machinery, a set of Barrel and Basket Hoop Machinery, Basket and Hamper Bottom Rounders, Nailing Forms, etc.

EDGINGS

Ontario

The National Furniture Company, Limited, of Berlin, Ont., has secured a license to carry on business, as furniture manufacturers, in the province of British Columbia. The provincial office of the company is at 837 Hastings Street, Vancouver, B.C.

The Sims Lumber Company, Sault Ste. Marie, Ont., who lost their mill by fire early last fall report that they do not intend to rebuild this season. They find that they can buy their stocks all manufactured much cheaper than they could manufacture them themselves.

The Goderich Milling & Lumber Company, Goderich, Ont., will soon commence work upon the erection of a planing mill. They are at present negotiating with the town council for tax exemption. The building will be one storey, 200 x 60 ft., of concrete and brick construction.

M. D. Seaman & Son, Sauble Falls, Ont., report that the timber on their limits is almost finished and they will soon be closing their mill. They intend to go into the manufacturing of sand lime brick. They report that if they have good sleighing this winter they may take out a very small stock of logs.

The Wood Mosaic Company, Inc., New Albany, Ind., report that they have been delayed in their plans for rebuilding the plants which they recently lost at Louisville and New Albany by fire. It will therefore be February or March before they will commence operations upon their proposed plant at Stratford, Ont.

The Lakes Timber Company, Limited, has been incorporated with a capital of \$50,000, with head office at Fort Frances, Ont., to carry on business as lumbermen. The provisional directors are: W. J. Law, auditor, and A. A. D. Rahn, lumberman, of Minneapolis, U.S.A.; O. Herman Diercks, lumberman, Rainy River, Ont.; A. B. Colburn, lumberman, of International Falls, Minn., U.S.A.; and W. F. Zauke, accountant, of Spooner, Minn., U.S.A.

Tenders are being received by W. H. Hearst, Minister of Lands, Forests & Mines, Parliament Buildings, Toronto, for the right to cut blown down and standing timber on McGregor Island, Georgian Bay. Parties making tenders are required to state the amount they are prepared to pay per thousand feet board measure in addition to the Crown dues of \$2 per thousand feet B.M. Also the rate they are prepared to pay per tie for any timber made into railway ties, in addition to the Crown dues of 5c each. The blown down timber is to be cut and removed by the 1st of July next. The green standing timber to be removed by the 30th day of April, 1916.

A despatch from Port Arthur, Ont., states that Mr. J. P. Bertrand of that place is organizing a new company under the name of the Bertrand-Lockhart Lumber Company and has applied for a charter. The provisional directors are A. G. Seaman, lumberman; W. Marrigan, director; J. H. McLennan, lumberman; H. A. McKibbin, financial agent, and J. P. Bertrand, lumberman. The company intend to erect buildings and make improvements to the yard at the corner of Hesther and Ontario Streets. Arrangements are also being made for establishing a yard in West Fort William. The company will do a retail and wholesale lumber business and will operate a small planing mill.

A lot of valuable timber and pulp wood land operated by the MacLaren Lumber Company, of Buckingham, and others, was involved in the transfer recently announced of the Thirty-One Mile Lake watershed in Quebec and an area of 150 square miles surrounding it from the Quebec Government to the city of Ottawa. Ottawa is purchasing it in connection with its scheme for obtaining pure water from Thirty-One Mile Lake and the others in its chain. It has obtained the land at a nominal price from the Quebec Legislature, but the latter body has retained the timber rights. Lumbermen and paper mill owners will be able to carry on their operations throughout the watershed as usual, though not in such a way as to cause pollution of the waters therein.

The Canon Lake Lumber Company, Limited, which was recently incorporated, has its head office at 734 Somerset Block, Winnipeg, Man. The company has a license to carry on business in the province of Ontario. Its capitalization is \$100,000. The president and manager is Mr. Porter P. Elliott, Winnipeg, and the secretary-treasurer is Mr. W. L. McIntosh, Winnipeg. The company's mill is situated on the main line of the Grand Trunk Pacific, 160 miles east of Winnipeg in the province of Ontario at McIntosh Station. They propose to carry on the manufacture of lumber, ties, piling, etc., and have contracts with the Grand Trunk Pacific, for ties, piling, bridge timber, etc. The company is shipping lumber at present into the Minneapolis market. Mr. Porter P. Elliott is still carrying on his timber and tie business as formerly under the name of P. P. Elliott.

Eastern Canada

Edgar Caron & Cie, sash and door manufacturers, Montreal, P.Q., have been registered.

The MacArthur Hee Company, Limited, have sold out their woodworking factory at Stellarton, N.S.

S. E. Desmarais & Company, Richmond, P.Q., recently lost his saw and grist mill by fire. No insurance was carried.

Dawson & Brothers, lumber manufacturers, Newport, P.Q., have been registered. The members are A. Dawson and M. L. Dawson.

The St. George Pulp and Paper Company, South Street, St. George, N.B., are considering plans for enlarging their pulp mill and may also erect a paper mill.

The Papineauville Lumber Company, Papineauville, P.Q., have decided to erect a mill for the manufacture of hardwood veneers for cooperage and cheese boxes.

Under the winding-up of the Wotton Chair and Toy Manufacture, Limited, Wotton, P.Q., the liquidators are selling the property, including a saw mill and machinery, by tender.

Larue & Trudel, 126 St. Peter Street, Quebec, P.Q., have been receiving tenders until January 15th for the purchase of license 110, Callieres South,

17 square miles, and license 111, Callieres North, 28½ square miles, together with a sawmill equipped with machinery and 132 acres of freehold land at Port aux Quilles, P.Q.

Mr. John H. Crandall, of Moncton, N.B., has sold his mill and lumber lands at Notre Dame, Kent County, to Mr. W. D. Gunter of Fredericton. Mr. Crandall will continue operations at Stilesville.

The Davison Lumber Company, of Bridgewater, N.S., is building a tramway by which lumber from its upper mill will be carried across the river and placed on cars for shipment. The company is making extensive improvements to facilitate the shipment of lumber.

Mr. Chipman McFarlane, of Salisbury, N.B., has resumed lumbering operations at the head of the Cocagne river, parish of Moncton. Sawn lumber is being hauled from his mill to Catamount Siding, on the I. C. R. Mr. McFarlane is lumbering this winter on an extensive scale.

The Partington Pulp and Paper Company have considerably enlarged their plant during the past year, and are now completing a new warehouse and a conveyor to carry the pulp from the mill to the warehouse, beside the railway siding which they have also had constructed for their use.

A syndicate of English, French and Canadian capitalists, with Capt. B. A. Scott at its head, is reported to be working on a proposition for establishing a large pulp and paper plant on the Saguenay River, in Quebec, and developing water power on the Grand Discharge Rapids. It is said that the development will yield 350,000 h.p. and that over \$4,000,000 will be spent on power plant, dam and pulp and paper mills.

In a despatch from Antigonish, N.B., it is stated that the Colonial Lumber Company of that place has completed the equipment of a plant for the manufacture of hardwood flooring, veneering, wainscoting, etc. They have timber areas in Antigonish and Guysboro counties that will assure a supply of 4,000,000 feet annually. The company will commence operations in the early spring. The plant represents an investment of over \$200,000.

The Grand Falls Company, Limited, will begin work very soon upon the erection of large pulp and paper mills at Grand Falls, N.B., on the St. John River, where immense power can be developed, and where it is proposed by this company to build up a very extensive industry. It will be possible to develop electric power at Grand Falls and transmit it long distances to towns and villages along the river. Sir William Van Horne is associated with this enterprise. The proposal also includes a power development of about 80,000 h.p. The cost of the pulp and paper mills will be about \$2,500,000 and the whole undertaking is estimated to involve about \$8,000,000.

Western Canada

Fire recently destroyed the plant of the Lee Lumber Company, at Wigwam, near Revelstoke, B.C. The loss was \$30,000.

Ten thousand dollars' damage was done recently when the dry kilns of the Lulu Island Shingle Mills, containing a full load, were destroyed by fire.

Jacob Kaufman, Berlin, Ont., states that his cut this winter will be about the same as last winter, viz., 125,000 feet of logs, principally hemlock, with only a few thousand feet of hard wood.

Harry C. Moore, Blairmore, Sask., is looking into the feasibility of establishing a wood distillation plant at Vernon, B.C. He has also been considering a similar plant to be established at Cranbrook, B.C.

M. M. Boyd, Bobcaygeon, Ont., who has large timber holdings on Vancouver Island, B.C., will build a mill to operate upon them. He is as yet undecided whether to build on the Island or Burrard Inlet, since he owns water frontage there.

The Rat Portage Lumber Company has established a logging camp at Ford Harbor, B.C., and will put about 1,000,000 feet of timber a month into the water. The Dempsey Logging Company, Limited has also opened a new camp at Canish Bay, Valdez Island.

P. Welch, 325 Howe Street, Vancouver, B.C., has completed plans for the erection of a sawmill with a daily capacity of 50,000 feet to be erected at Chemainus, B.C. The machinery has been purchased. The engineers are J. B. Wier & Company, 737 Pacific Street, Vancouver.

Timber berths No. 554 and No. 557, located near Pitt Lake, B.C., were auctioned off at the government timber office, New Westminster, recently. The former was bought by A. Barnett, Renfrew, Ont., for \$7,570, the area being 2,428 acres; the latter brought \$1,700, it being 753 acres in extent.

The Empire Lumber Company, which owns extensive timber lands in the neighborhood of Cowichan Lake, Vancouver Island, is about to erect a tide-water mill at Crofton, B.C. This concern is a constituent company of the American Finance & Security Company of New York City. W. C. Marsh is president, C. C. Young is vice-president and will be the resident manager. The capital stock of the company is \$7,000,000, and the timber purchased a few years ago from the Canadian Pacific railroad comprises part of the E. & N. railway grant. It is about 100,000 acres in extent.

The British Canadian Lumber Corporation has organized a bond issue of \$3,500,000, secured by an 8 per cent. note issue for three years to the amount of \$3,600,000. The directors asked for a minimum subscription of \$1,000,000, and this was over-subscribed by the shareholders. The company paid \$700,000 on timber limit purchases November 15, and will pay another \$500,000 January 1. With the money available, all liabilities may be paid off, and a working balance of \$700,000 left. This concern has a large mill at Coal Harbor in Vancouver, a new plant at New Westminster, and a mill on the Little Slokan River, Kootenay.

The Kootenay Mills, Limited, head office Moose Jaw, Sask., has been formed to take over the property of the W. E. Cooke Lumber Company, including a mill and a sash and door factory at Kaslo and 5,400 acres of limits in the Duncan River and Lardo River district. J. Wright Sifton, Moose Jaw, president of the Executors and Administrators' Trust Company, is president of the new company and the secretary is Mr. R. H. Fulton, of Moose Jaw, general manager of the Bank of Saskatchewan. The new company will rebuild the Cooke mill at Kaslo and install modern machinery. The old mill will be used to cut the lumber for the new one. Work will commence, it is reported, about the end of January. When the Cooke mill was formerly operating there were two other mills on Kootenay Lake, the Watts mill at Proctor, and the Yale-Columbia mill at Nelson. These two were destroyed by fire.

Kent's Cordwood Splitter

1. Conveyor of logs to saw.
2. Steam hold down.
3. Cut-off saw.
4. Conveyor from saw to splitter.
5. Steam piston.

7. Steam head block.
8. Can be used as friction drive to carry wood out.
9. Vertical splitter.
10. Adjustable horizontal splitter.
11. Delivery table.

THE expensive operation of splitting cordwood has been reduced 50% in cost. Every kind of timber no matter how crooked or knotty can be easily split by the Kent Cordwood Splitter.

Cut-over limits may be turned into good profit. The splitter can be set up in the woods and while your Winter operations are in full swing—roads made and equipment running—you can send all logs unfit for lumber to the Splitter where they will be quickly made into cordwood ready for shipping.

If the splitter is used in the woods a boiler of the 35 h.p., 90 lbs. or more working pressure will supply ample power. If in the yard a 2" pipe line from boiler plant will run the Kent Cordwood Splitter.

Send us your inquiries

Kent Cordwood Splitter Company
MEAFORD, ONTARIO

"WAKE UP"

Rip Van Winkle slept for twenty years while the world moved on.

Of course, Rip never did anything of the kind literally. Irving used him to typify a class of New Yorkers who were direct descendants of the founders of New Amsterdam, who never progressed and of whom he was very fond of making fun.

To us Rip Van Winkle typifies a-Behind-the-Timer. You will find him in every business and in every walk of life. You'll find him in the lumber business—but he never uses a 77 Model 5 unless he "wakes up"

The new book on Model 5 will prove to you that no other Planer and Matcher equipment is so quite up-to-date as the American.

Let us send you a copy of the book.

Brake Your Load and Save Your Horses

Besides avoiding accidents and eliminating sand hilling this braking device can greatly reduce your hauling costs. Larger loads may be handled and fewer men employed.

Barienger Braking Device for letting heavy loads down steep hill and mountain roads. Saves horses and expense of sand hilling.

GOODHUE BELTS

"Acme Waterproof" Leather Belting

This brand is especially well suited to the wet places in a saw or pulp mill and will run true as long as it is in service. When you are overhauling your mill equip it with "Goodhue Belts" and you will never regret it. They are honestly made of solid leather—every inch a good belt and they won't stretch.

Get our details and prices.

DANVILLE - QUEBEC

GET 20 PER CENT. MORE LUMBER FROM YOUR LOGS

Results from logs of given dimensions cut on Breeze, Denison & Co. pat. band mill.

Diam.	Log Length	Feet Lum.
8 in.	16 ft.	45
10	12	51
10	16	69
11	15	96
14	16	171

by using our Patent Steel Band Mill and Carriage

This result was attained by different users of our mills during the season of 1912. We can prove to your satisfaction that this mill will cut more lumber and superior lumber than any other Band or Circular Mill on the market.

Special features of Mill

Concrete foundation not necessary. Frame constructed with brace bolted to same timbers which support base of mill. This prevents any movement of mill foundation throwing mill arbors out of cross line. Supporting timbers attached to track which prevents variation in cutting of boards.

Roller Bearing Carriage

designed to do away with lost side motion which is quite necessary for successful work in double cutting bands.

Double Action Friction Set Works

working on thin steel disc, which can be successfully used in place of usual foot friction in receding knees. This cuts down weight in pinion shaft, therefore reducing momentum, so that it is beyond speed of setter to over set by rapid work. Carriage can be changed from high to low speed instantly and can be operated without passing saw more than six inches either way. Knee opening to 44 inches. Guide prevents any binding motion to the gip and will automatically raise when coming in contact with knot in timber. Guides adjustable when mill is running.

A Canadian Built Mill of superior manufacture.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

December 20th, 1912.

Higher Grade Mouldings at a Lower Manufacturing Cost on a 305

Mr. Moulding Manufacturer, are you aware of the advantages the man who uses The ^{FAY-EGAN} "Lightning" No. 305 has over the one who uses any other method of making Inside Mouldings? Almost any Inside Moulder will produce fine work on clear stock but with the knotty and cross grained stuff it takes a 305 to turn out the whole lot grading A-I.

There's a reason for the perfectly smooth work that comes thru a 305—extra heavy construction throughout entirely eliminates mis-manufacture of patterns, profile jointers for knives keep cylinders working up to their highest efficiency. Moreover, the 305 is designed after the most modern Matchers, wide open construction, cut gear drive, independent drive to each cylinder, etc.

As the first step towards increased efficiency in the Moulding department—Bulletin 2-F—Write for it today.

J. A. FAY & EGAN CO.

Potato Scale Boiler Cleanser

This compound is a deadly enemy to scale and not only removes scale from tubes but if used regularly in the feed water prevents the formation of scale.

It contains no ingredients that can in any way harm metal.

Potato scale is sold under a guarantee—thousands are using it and are perfectly satisfied. Write for sample keg.

Tested in the Laboratory of Time

For scores of years Disston Saws have been tried out under all sorts of conditions. They have successfully stood up to all natural requirements, and passed through many an ordeal for which they were never intended.

This has inevitably led to increasing demand. Today they are used in a majority of the lumber mills and camps of the world.

DISSTON SAWS

are distinguished for the highest grade of material and workmanship—which includes hardening and tempering, tensioning, etc.—that is the natural result of generations of saw-makers working with similar ideals, under the guidance of men who have the accumulated experience of nearly three-quarters of a century to draw upon. The facilities and experience of this plant make possible the production of these unequalled saws—the excellence of the saws have made this plant the greatest saw works in the world.

COTTON BELTS LEATHER BELTS GANDY BELTS CAMEL HAIR BELTS BALATA BELTS RUBBER BELTS ROPE DRIVES

Here is one more proof—an unbiased recommendation through the January Woodworker:

"Have had in use for fifteen months on a 5 kw. dynamo, a 5 in. three-ply cotton belt which has proved very satisfactory.

"Before putting belt to work I stuff it full of Cling-Surface and find I have a belt which handles the load in even better shape than a first-class leather belt and at just about one-third the cost.

"I also use the same kind of belt and method of treating in light feed belts on various machines with perfect satisfaction."

The man who wrote the above, (name unknown to us) certainly thinks well of Cling-Surface, but so does every body who uses it.

Notice, he said, "I stuff it full of Cling-Surface." That's the proper way to treat a belt. The outside is of secondary importance. Reach the inside of the belt.

All belts are improved by Cling-Surface treatment. Even good rubber belts, as we have repeatedly proved in

All Need Cling-Surface

actual installations, always do better with this treatment properly used.

Investigate Cling-Surface personally and you will find it a real essential to efficient belt management.

Let us have a trial order and if the Cling-Surface doesn't make good the trial won't cost a cent. Ask for our literature and let us quote f.o.b. Toronto.

THERE'S A BERLIN BAND FOR EVERY PURPOSE

On Berlin Band-sawing machines are improvements that cannot be bought elsewhere at any price.

And in the Berlin line of Band Rip and Resaws there's a machine especially adapted to whatever work you want to do.

For resawing cants or planks or slabs, or ripping any kind of stock there's a Berlin to do it at the lowest cost to you.

Equip your mill with Bands of one make, head mill to Ripsaw. Install machines of similar design with similar operating devices. Then any operator can work well with any Rip or Resaw in your mill without any "breaking in."

Each Berlin Band is adapted to certain work. The close-coupled resaw with short, stiff blade and powerful feed works will take all the cants dropped to it by two Band mills.

Low Production Cost

The Twin Horizontal with hopper feed, with its continuous cut, has a daily output of 45,000 board feet.

The Band Rip combines quick, accurate operating with fast feeds and lowers production cost of ripping molding, flooring and special stocks.

There's a Berlin Band working near you, under conditions similar to yours. See it in operation. Talk with the owner. Ask for his name and address.

This Band Saw catalog illustrates and describes the line complete.

Write for it Today

THE BERLIN MACHINE WORKS, LTD.

Hamilton, Ontario

United States Plant, Beloit, Wis.

Horizontal Slab Re-Saw

A Horizontal Slab Re-saw will increase the capacity of a saw-mill from 15 to 25 M ft. at a less cost for equipment and a less cost for operation, than can be accomplished in any other way.

One customer in Canada has purchased 7 of our Re-saws, another 4 and another 3. Catalogue gladly furnished without obligation to you. It also illustrates many special Box Factory Machines.

LOGGING LOCOMOTIVES

The locomotive illustrated was built for MacKenzie, Mann & Co., Contractors, Montreal, Canada, and represents the latest development in this type of locomotive.

It is suitable for logging contractors, quarries, mines and industrial service. It will haul 1,875 tons on level, and 160 tons on 3 per cent. grades.

Consult us when in the market for new locomotives. Let us help you select the locomotive best suited to your needs.

Logging Locomotives

Mikado Type Locomotive, Polson Logging Co.

The Mikado is a good type for heavy hauling, where runs are fairly long and high steaming capacity is needed. The locomotive illustrated traverses 30 degree curves, and can be used on rails weighing 45-50 pounds per yard. It is simple in construction, strongly built, and rides well on uneven tracks.

When in need of a logging locomotive, consult

The Baldwin Locomotive Works

Philadelphia, Pa., U. S. A.

**ECONOMY IN LOGGING OPERATIONS**

FIFTY years experience has taught us how to build logging and industrial locomotives that will give the greatest amount of power for the lowest fuel consumption.

The simple and sturdy construction of our locomotives is also a notable feature. They are easy to control and economical in repair.

Our Logging and Industrial locomotives are specially designed to meet the conditions under which they are expected to operate. *Send for Specifications.*

No Mountain Pass too Steep for
the Horse shod with

Red Tip Calks

Nowhere are surefooted horses more necessary than in the dangerous mountain passes and steep slippery hills encountered daily by the lumberman.

Red Tip Horseshoe Calks

here prove their value, and their cost is but a slight premium to pay as Horse Insurance.

The horse shod with Red Tip Calked Shoes is fearless and capable and can do the work required of him without danger to life or limb.

WHY you should install the **Mahony Blower** System in your Planing Mill

Fifty per cent. higher efficiency than any other on the market to-day, uses $\frac{1}{2}$ less power, costs less to install, no cyclone required, eliminates back pressure on the fan. I will undertake to increase the capacity of any system now installed 50 to 100% by the application of the Mahony Back Pressure valve on your fan, without using a scrap more of horse-power.

THAT FUNNY STORY!

IF anybody tells you that funny story—that the Waterous Company are selling Sawmill Machinery solely on the strength of a reputation—that we are building machinery that is behind the times; in other words that we are trying to hand the Canadian Sawmill trade a fossilized product—*don't you believe it.*

We have been in business 60 years, it is true,—we are proud of it and say so wherever we can—but that doesn't mean that we are building Sawmill Machinery that

is sixty years out of date. On the contrary, just because of that experience, we are in closest touch with Canadian sawmill conditions, and in the best possible position to build the right machinery to keep abreast—or a little ahead—of those conditions.

Every new idea that is likely to improve Canadian sawmilling is given consideration in the designs we place on the market. No matter what success we may have with any machine we get out, we are willing to change it if it will do the work better or cheaper when altered.

As an illustration. In 1909 we placed a new Band Mill on the market that was a success from the start. It is being used in place of other makes in many of Canada's largest sawmills to-day. We issued a catalogue in the same year to describe the working and construction of this machine. Just now we are reprinting this catalogue—and we are spending more than \$300.00 to buy new cuts to illustrate the improvements we have made in this new Mill since it was put on the market less than five years ago. *Is that letting a reputation sell machinery for us?*

And remember this—our motto is "Up-to-date machinery for up-to-date mills"—and our machinery is built to conform to this motto. When you specify Waterous you specify machinery that is modern in every way—and that is backed up by a reputation that is sixty years old.

The Waterous Engine Works Co., Ltd.

BRANTFORD, CANADA

Agency—H. B. Gilmour, Vancouver, B. C.

Branch—Winnipeg, Man.

"FROST KING" METAL

Our thirty five years experience in metal mixing enables us to place on the market a babbit that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock this, write us and we will take pleasure in making you a shipment of a 25 lb. box.

\$5,000,000.00

worth of mixed metal
sold annually.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 16-ft. Slash table. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 2 Lath Trimming Saws. | |
| | POWER PLANT |
| | 1 24 x 36 Slide Valve Engine with 40-in. x 12-ft. extra heavy double arm split fly wheel. |
| | 2 Double Duplex, high pressure Water Pumps. |
| | 5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam. |
| | 2 125 h.p. Water Wheels. |
| | 1 Upright Engine for sawdust conveyor. |
| | 1 10 h.p. Engine. |
| | 1 Mitts & Merrell Hog. |
| | 1 Wood Machine for 22-in. wood. |
| | 1 Wood Machine for 16-in. wood. |
| | 1 Edger for ripping dry lumber, installed. |
| | 1 Edger for ripping dry lumber, not installed. |
| | 1 30 h.p. Generator, 250 volt. |
| | 1 30 light arc generator. |

FILING ROOM

- | |
|--|
| 1 Automatic Filing Machine for 12-in. D.C. band saws. |
| 1 Automatic Grinding Machine for 8-in. S.C. band saws. |

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and rails and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

"Noted for their Thoroughness of Construction and Quality of Work."

That is what our hundreds of satisfied customers say of

"Defiance" Woodworking Machines

Especially do we wish to call your attention to our new
No. 6 AUTOMATIC BELT POLISHING MACHINE
as illustrated herewith.

It is especially designed for rapidly and accurately polishing carriage and wagon spokes to a high finish. By this method the exact shape of the turning is maintained, smoother and better work secured with the employment of unskilled labor. The polishing belt is 18" wide, 16' 8" long, made endless. It is strained outward by two convenient hand screws with sufficient adjustment to accommodate a variation of two feet in the length of the belt. The work is rotated automatically, leaving both hands of the operator free to place in and remove the finished stock.

Upon request we will be pleased to furnish you with further information and price.

The Defiance Machine Works, Defiance, Ohio, U.S.A.

No. 6 Automatic Belt Polishing Machine.

MAPLE LEAF SAWS

MAPLE LEAF SAWS, **"THE PROVEN BEST,"** absolutely guaranteed. Be sure and specify Improved Racer Cross Cut Saw when ordering your camp supplies. They are made of Razor steel and tempered by our secret process, which gives the best results under actual working conditions in the bush.

Knight Pony Lath Mill

This mill is built for use with a 10 to 15 horse power engine and as single mill only. It is specially suited to the requirements of thresher and saw mill men operating in small tracts of timber, as both husk and carriage are of a size which will permit of easy loading between the standards of a wagon when moving from one setting to another.

Write for the catalogue of the Knight line of saw mill machinery.

Size "S" Single Mill with 16-foot Carriage

Size Husk ... 3 feet by 6 feet 3 inches
Diameter and Length Mandrel . 2 3/16 by 55 inches
Size Drive Pulley ... 20 by 10 inches
Feed per Revolution of Saw ... 0 to 3 1/4 inches
Feed Belt ... 4-inch Gandy
Largest Diameter Saw ... 56 inches
Length of Carriages ... 12, 16, 20 or 24 feet

Width of Carriages ... 33 inches
Trucks ... 7-inch wheels and 1 1/4-inch axles
Length Track ... 32, 40, 48 or 56 feet
Style and Opening of Blocks ... C1-36 inches
Style Mill Dogs ... Pony Excelsior
Style Set Works ... No. 1 Single Ratchet

With each complete size "S" mill we furnish one saw, wrench, cant hook, feed belt, pulley with boxes for tightener and foundation bolts for husk

SAW MILL OWNERS

Have your Filers send into the office, specifications of the saws they will require for starting next spring. We can arrange to have orders for Simonds Saws made up so you will have them when they are required, to be shipped on any date you may mention in the spring. In case of an early spring this precaution may save delay in your mill.

SIMONDS CANADA SAW COMPANY, LIMITED

St. Remi St. and Acorn Ave., MONTREAL, QUE.

VANCOUVER, B. C.

ST. JOHN, N. B.

B.B.L. DOORS

In the manufacture of B. B. L. Doors only thoroughly well seasoned lumber is used.

Our plant is new and modern so that we are able to make prompt shipment on all orders.

Special prices quoted on large orders or shipments from stock.

We will be pleased to send you particulars and prices of B. B. L. sash, doors and trim.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, \$2.00 per year in advance; other foreign countries embraced in the General Postal Union, \$3.00.
 Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 34

Toronto, February 1, 1914

No. 3

1913—What It Teaches for 1914

This issue of the Canada Lumberman contains statistics telling of the course of trade during the year 1913. Some of our readers may think that the less said about the trade of last year the better it will be for all concerned, but others are not of the same opinion and feel that the lessons of the past year are nearly as valuable to them and to the trade in general as would have been a more general earning of cash profits. Taking things in general, we have been forcibly taught during the past twelve months that the lumber business depends not only upon business conditions throughout the country, but also upon the methods followed by those who are engaged in it. This is brought out forcibly by the contrast between the course of trade in eastern and in western Canada respectively. In the east, thanks to a natural combination of circumstances, lumbermen were unable to over-produce during the winter of 1912-13. In fact the year commenced with stocks greatly reduced, both in the yards and at the mills, while the stocks of logs for 1913 sawing were much smaller than in previous years. During the year, the output of Eastern Canada was further reduced, by strikes at St. John, N.B., and by an unusually large number of serious fires at sawmills. Many of the largest mills in the country were out of commission last year. Thus it happened that, although business depression was general throughout Canada and the United States, the lumbering industry and trade of Eastern Canada did not actually suffer to anything like the extent that would have been the case had there been any over-production. In Western Canada a different story is told. One needs only to read the report of the annual meeting of the Mountain Lumbermen's Association, published in this issue, to be convinced that the lumber industry and trade of British Columbia is in a practically hopeless condition, so far as its ability to protect itself in times of business depression is concerned. The capacity of the mills is in excess of the natural consump-

tion of the markets which have to be supplied, and, in addition, the manufacturers of the Western States have found their way into these same markets and are making matters still worse. These are conditions which may be of little importance in times of pronounced business activity, but whenever depression sets in they become vital. The contrast between the results of the depression in the two parts of Canada, east and west, illustrates the evil of over-production and the advantages of curtailment at one and the same time, and brings them home in a very forcible manner.

There were many events of unusual interest to the lumber trade of Canada during the year 1913 which might be mentioned in review. They are discussed in detail, however, in other parts of this issue. Probably the most important of these was the removal of the duty on lumber entering the United States. This opened to Canadian lumber a wide and varied market. Practically every kind of Canadian lumber which has sufficient value to stand the cost of freight to the United States, will feel the effect of this change. We may count upon this widening of our markets being a decided benefit to the industry during 1914 and future years. Along the same line, a new influence has come into effect in connection with the lumber industry, namely, the approaching opening of the Panama Canal, which will make it possible for the lumber of the Pacific Coast to be delivered in Eastern Canada, the Eastern States, and Great Britain in competition with the products of mills situated much closer to these markets. This influence is already making itself felt, although the actual opening of the canal is still some distance in the future. Enquiries about prices of west coast products delivered via the Canal to eastern points are already being made, and are affecting purchases of other stocks which formerly were not affected by competition from the west. Lumber manufacturers of eastern Canada will be affected equally with those of the eastern and southern States. New Brunswick, Nova Scotia, Quebec and Ontario manufacturers are commencing to discuss the effects of this development upon their markets. The opinion is frequently expressed that British Columbia products will soon be a much greater factor in connection with eastern markets than they have been in the past.

From the reports which are published in this issue and which deal with the situation in all parts of Canada, it is evident that events are shaping themselves for improved trade during 1914. The people of the west are not so hopeful as those of the east, but they were among those who went furthest in the direction of over-confidence last year. They were more active in discounting the country's future. The east sinned quite enough in this respect to deserve all it got, but the west went much further and may be expected to recover less quickly. It is evident, however, that a feeling of encouragement has commenced to spread over the country. It may be a little premature, and it may take us longer to throw off the ill effects of our recent trouble than we think. The next few months, even weeks, will probably show us whether this is the case or not, but it does seem reasonably certain that the question is now simply one of time, as the process of readjustment has gone far enough to show that the financial, commercial and economic situation in Canada is entirely sound and has been suffering only from a temporary, although violent, indisposition.

It has been estimated that the forest revenue of British Columbia for 1913 will amount to \$3,000,000, an increase of \$400,000 over the revenue of 1912. It represents about 28 per cent. of the gross provincial revenue and is said to be nearly three times as great as that of any other province in Canada. The total expenditure for 1913 on the forest branch will approximate \$350,000, of which \$150,000 has been expended on permanent improvements. The number of men on the staff during the height of the season was 460, which included 340 guards and patrolmen, 30 rangers, 25 forest assistants and members of the technical staff of the force, and 11 district foresters. Collections for the forest protection fund are made at the rate of 1½ cents an acre from areas of 8,500,000 acres under license, 1,000,000 acres under timber lease, and 1,500,000 acres of privately owned timberlands. The Dominion Government contributed this year \$167,000. Adding to this the contributions of timber holders and owners and railway companies, there is available a total fund of \$347,000.

Lumber Trade of Ontario During 1913

Manufacturing Statistics Show an Increased Cut in Georgian Bay District—Financial Stringency Affected Trade—Outlook Improving

Looking back upon the lumber trade of Ontario during the year 1913, one is struck, probably more than anything else, by the fact that the course of trade followed very closely along the lines which were expected by those who studied trade conditions closely. For some time previous to the first of January, 1913, many shrewd business men were sounding a warning in connection with the great extension of speculative building and speculative business development in general. The year opened with a very strong trade for nearly all varieties of lumber. The market was already wide, varied and brisk and continued so until the month of March. Then, when the spring trade should have been opening up and making business even more lively, circumstances developed which had been predicted by careful observers for some months previous. The banks of Canada, with practical unanimity decided that the time had come to cry a halt in the unlimited extension of credits. The money stringency immediately commenced and the lumber trade of Ontario, along with that of all the other provinces of Canada felt the effects immediately. For a time the situation seemed doubtful and it appeared as though a short period of rest would clear the air and bring business conditions back to a normal basis, but it was soon found that the financial situation was far less satisfactory than was at first believed. The country, in fact, was seriously crippled for want of money, which had been tied up in real estate in practically every part of Canada. It took many months for this situation to be remedied. In fact the process is still under way today, although such progress has been made as to make it certain that the corner has been turned and that sound business expansion may now proceed.

Although the lumber business felt the money stringency greatly, the actual effect upon the lumber trade of Ontario was not really disastrous. There were many reasons for this. In the first place, the lumber industry was better situated probably than many others, because it had entered the year with greatly reduced stocks. The year 1912 had seen such an active demand for lumber that stocks were depleted to a greater extent than had been the case for many years previous. The winter of 1912-13 was a poor one for logging operations and the output in the woods was far below the average. Manufacturers were thus prevented from over-producing, and, as the season advanced, stocks were depleted almost to the vanishing point. Moreover, before the money stringency set in, a large amount of construction work of various kinds was already under way, so that the demand from this quarter was greater than it would have been, had the scarcity of money developed a few months earlier. The actual amount of lumber moving during the last nine months of 1913 was much smaller than usual, but on account of the circumstances above outlined, there was a fair enquiry and prices were maintained remarkably well.

The above conditions apply more particularly to the lower grades. The intermediate and upper grades of white pine moved very slowly, owing to the strong competition of California sugar and white pine, Mexican white pine, Idaho white pine and long leaf and short leaf yellow pine from the Southern States.

The intermediate grades of white pine were more seriously affected by yellow pine than by any of the other foreign stocks. "B and better" could be laid down in Toronto at prices very little in advance of the mill prices of white pine. The better grades of Ontario white pine suffered from the competition of Idaho, Mexican and California white pine. These were laid down at Toronto at prices from \$2 to \$4 per thousand less than the manufacturers' prices for the Canadian article of a similar grade. These foreign woods, although not quite so good as our native products, fill the bill fairly well, and the consumer is being educated to accept and use them, so that there is a strong possibility that they have now obtained so strong a hold in our markets that it will be a long time before our white pine in "shop and better" will regain the position which it occupied in the early part of 1913. It would be unsafe to predict that this is certain to be the case, yet the indications at present are strongly in that direction.

Culls and box pine reached the peak during 1913 and kept about the same level throughout the whole season. These grades did not meet with the same competition from foreign stocks, owing to the freight charges being the same upon poor stock as upon high grade and having a greater relative bearing upon the cost.

One of the important events affecting the lumber trade during the year 1913 was the removal of the duty upon lumber entering the United States. Eastern spruce during 1912 and 1913 had been successfully increasing its market in Ontario and had become a strong competitor of hemlock and white pine strips. The removal of the

duty upon lumber entering the United States, however, gave to the spruce of Eastern Canada a much wider and more convenient market in the State of New York and the New England States, where large quantities of it are being marketed at present. Unless the United States market fails, it is likely that the manufacturer of eastern Canadian spruce will turn more naturally to it in future than to Ontario. Nevertheless the hold which this stock secured upon Ontario markets during 1912 and 1913 was such that a good market for it will continue under normal conditions.

The market for shingles fluctuated considerably. At the first of the season, there was a very strong demand on account of the large consumption created by the heavy storm during the month of March. After this demand had been satisfied shingles commenced to sag and kept on sagging until manufacturers and dealers were nearly driven to despair. Toward the latter part of November, prices stiffened a little and continued fairly firm through December. There is a fair prospect now that, before the month of June, shingles will have got back to their normal level. The stimulation in prices which occurred in November and December was largely the result of the removal of the duty upon shingles entering the United States.

Lath were firm throughout the whole of the season of 1913 and prices were fairly satisfactory to the manufacturer. The year closed with practically no visible supply of lath in manufacturers' hands.

Stocks of lumber in the retail yards throughout the province of Ontario at the present time are much below normal. This has been brought about chiefly by the money stringency which has prevented retailers from making speculative purchases or from securing large quantities of stock on credit. For many months, the retailer has been able to purchase only such stocks as he had immediate requirement for. Wholesalers throughout the latter part of 1913 exhibited extreme caution in their business method and did not push sales unless they were sure of the ability of the buyer to pay. Frequent requests for renewal of credit, by the trade throughout the country made a marked change in the methods of business followed by wholesalers. Many retailers sought renewals last year, who for years past had been in the habit of taking advantage of the discount for cash.

The course of business during 1914 is still a sealed book to the trade. There are signs, however, which point already in the direction of steady improvement. Some of these have been mentioned above. An important factor is, that in spite of the extensive amount of speculative purchasing of real estate during the last few years, Canada is still only on the threshold of its development, and so long as its growth is confined within reasonable limits, extension of a very satisfactory nature is certain. Had it not been for the speculation and consequent depression of 1912-13 the present year would have been the greatest for building operations that Canada has ever known. The demand for houses, factories and warehouses is still great, however, and the only necessary factor, which is still wanting, is confidence in our financial ability to provide for such rapid growth as is required. This confidence is returning today. It has been increasing since the turn of the year. The retailer, through whom the demand for lumber is expressed will probably continue doing business on a cautious basis, at least until the volume of the spring trade is more clearly indicated. The cost of money is the key to the whole situation. It is still difficult to secure, although easier than it was a month ago. If it becomes reasonably cheap, the other factors are already in evidence for making the lumber trade of 1914 active and profitable.

At the beginning of the year 1913 a material increase occurred in the prices of hardwoods in eastern Canada. From the lumber manufacturer's point of view, this was a pleasant situation, but from the point of view of the wholesaler, as soon as the tightness in money developed, the higher prices were the cause of some uneasiness. These two factors combined to act as a drag upon the movement of stocks. Fortunately, however, only the movement was affected to any extent. Prices were well maintained and at the present time there is no indication of any easing off in hardwood prices in Ontario. The export market in Canadian hardwoods fell off considerably at the end of 1913 and nothing has been heard from it as yet during 1914. Stocks to-day are reduced considerably and even a falling-off in the demand would not be likely to make much change in prices.

Weather conditions in eastern Canada have not been favorable for hauling this year. The season for cutting was good. Similar conditions have prevailed in northern Ontario. Reports received during the third week in January stated that the swamps were not yet

frozen. Many of the roads had to be broken down and built up afterwards in order to obtain good hauling.

Indications at present are that the cut of hardwoods in Ontario and Quebec this year will be light. The most noticeable feature of the market during 1913 was the increase in the demand for one inch first and second birch. The demand for this line was greater than for any other. This class of birch is being used quite extensively for interior trim and the demand for thicker than two-inch seems to be dropping off.

Ash was very scarce during the season of 1913, and the demand for it was greater than the supply. It commences to look as though this is a situation which may be expected to continue in Canada in the future.

Ontario Production Shows Slight Increase

Contrary to the general opinion among lumber manufacturers in Ontario, the production in Georgian Bay and Northern Ontario, as shown by reports received by the Canada Lumberman, was greater during 1913 than during 1912. The total production, as shown in the following table, during 1913 was 818,367,455 feet, as compared with a production of 793,178,072 feet during 1912, showing an increase for 1913 of 25,189,383 feet. Although this increase is slight, it is important in view of the fact that a decrease was expected by many of the Ontario manufacturers. The output of the year 1912, however, had shown a large falling off as compared with 1911, when the production of the same district amounted to 831,472,640 feet. When one recalls the poor weather conditions which prevailed during the winter of 1912-13, it is reasonable to suppose that the small increase shown during 1913 would have been much larger. If better weather had prevailed, the output for the year would probably have approached that of 1911. Among the more important increases for the year 1913 are the following:—Blind River, 5,500,000 feet; Keewatin, 6,800,000 feet; Kenora, 15,500,000 feet; Little Current, 11,000,000 feet; Otter Lake, 4,000,000 feet; Spanish Mills, 8,400,000 feet.

Ottawa Valley Lumber Production

Output for 1913 Decreased by 37,000,000 feet—Details of the Operations—Better Outlook for 1914

Ottawa, January 22nd (Special to the Canada Lumberman): Like every other branch of business the lumber trade in the Ottawa Valley was disadvantageously affected by the financial stringency which prevailed all over the country almost throughout 1913. Opinions gathered from some of the leading lumbermen concur that last year, though a fairly good one for business, was not so good as 1912. The appended figures, show that the cut for 1913 was not so large as it was in the previous year by 37,668,201 ft. Last year opened with promise of good things ahead, but the year had not advanced very far before the money market began to show signs of weakness and, by spring, the signs became ominous. Business in general was affected. There are brighter days ahead though for 1914. Every lumberman interviewed admits this, and the statements recently published by the leading bank officials in their annual reports bear out the lumbermen's predictions. Bank officials agree that the worst is past in regard to tight money.

The recent amendment to the United States tariff is expected to bring more business from the south of the line than has come to the Ottawa Valley before. So far, no beneficial effects of that tariff have been felt here, but it is generally agreed that it is still rather early to look for results. While the changes in the tariff were being considered by Congress, United States buyers were not placing any more orders for lumber here than they were absolutely obliged to fill. The value of the lumber exported in 1913, according to the figures given out by the United States Consul in Ottawa, was \$185,425.88 less than in 1912. The total value of the export in 1912 was \$2,494,120.97, against \$2,303,695.19 in 1913. Had the tariff question been settled earlier in the year, there would probably have been a substantial increase in the value of the exports for 1913 over the previous year.

Another factor which militated against business locally last year, was the long period of dry weather, which caused a scarcity of water in the rivers and streams throughout the district, consequently hampering operations at some of the sawmills. The Hawkesbury Lumber Company had to shut down for several weeks during the summer owing to low water with the result that their cut last year was 42,000,000 feet against 61,000,000 in 1912. Given good conditions the cut last year would have been as large if not larger than in 1912 says Sir Henry Egan, the managing director of the company. The Estate James Davidson had their mills handicapped by low water and, consequently, their cut was 1,500,000 less last year than the year before. The destruction of the big saw-mill at the plant of J. R. Booth was the reason why their cut was not so large in 1913 as it was in 1912. The mill was destroyed by fire in the spring. Shepard and Morse cut 26,564,000 in 1913, against 18,118,000 in 1912 and report that general business was good. W. C. Edwards Company cut 75,000,000 feet which was equal to the cut of the year before.

The Golden Lake Lumber Company, Eganville, was not operating its mill last year, which accounts for a decrease of 11,350,000 feet in the output of 1914. Other decreases included the following: Gilmour & Hughson, Hull, 2,000,000 feet; Fraser & Company, Ottawa, 1,200,000 feet; Fassett Lumber Company, Fassett, 7,437,641 feet; Rideau Lumber Company, Ottawa, 500,000 feet; Colonial Lumber Company, Pembroke, 8,000,000 feet; R. & T. Ritchie, Aylmer, 1,000,000 feet. The increases included the following: Shepard & Morse, Ottawa, 8,446,000 feet; Riordon Pulp & Paper Company, Hawkesbury, 3,973,000 feet; Petawawa Lumber Company, Pembroke, 1,000,000 feet; Gillies Brothers, Braeside, 3,705,440 feet; Dennis Canadian Lumber Company, 6,000,000 feet.

The export business to England was poor throughout the year, a result again, of the general depression of business due to the scarcity of money. Though the export firms shipped more lumber to England in 1913 than in 1912 the figures do not mean that business was better.

There was comparatively little demand for high grades and a big demand for medium and low grade stock. Prices were firm and in several cases somewhat in advance of those which prevailed in 1912. With the demand for medium and low grades increasing and the sup-

ply none too good there is a probability of an increase in prices before long. With conditions as they now are in the lumber trade the speculator finds little attraction to busy himself.

Labor was plentiful all through the year, yet the wages paid remained up to the high standard.

Ontario Stocks Depleted

Stocks of lumber are now very low. As soon as money matters loosen up and the demand improves, we think that the light stocks now held will disappear quickly. Lumber from the Southern United States is likely to affect trade in Ontario. On account of their unsatisfactory banking system, large United States manufacturers are forced to sell in times of panic at slaughter prices. Their free trade policy is bound to stagnate business there, as is shown by the history of the low tariff in the United States, we are likely to be affected adversely by conditions that are in prospect there. Nevertheless, we should have a good trade next year. We would have better trade and would keep more Canadian money at home, employing Canadian labor, if the government would give Canadian lumbermen the same tariff protection as is afforded to other Canadian industries employing less labor.—Chandler, Jones Lumber Company, Snow Road, Ont.

Reports From Readers Upon Trade Conditions

A Note of Optimism Prevails

Mr. J. A. Currie, president of Wilson Bros., Limited, Collingwood, Ont., visited Toronto recently on business. In conversation with the Canada Lumberman Mr. Currie said that the company's business during 1913, up to the month of July had been better than during 1912. In fact, the first six months were the best the company ever had. After that, of course, trade slackened off, but taking the year as a whole, its business was just about as large and profitable as that of 1912. The tightness of money brought about a decrease in the volume of orders during the last half of the year. Collections were very good throughout the year, but not quite as good as they had been during the previous year. The outlook at present according to Mr. Currie's view, is quite encouraging. Orders are increasing and the indications are that the improvement will continue. In regard to logging operations, Mr. Currie reports that they did not look very promising up to the end of December. A great deal of fallen timber, which was blown down in the storm of Good Friday was cut and skidded and ready for hauling in December, the lack of snow at that time looked rather discouraging. However, plenty of snow is now on the ground and no further difficulty is expected in connection with logging operations.

In our opinion hemlock will hold its price during 1914. We do not expect pine to be so strong. Hardwoods should be "O.K." if the log cut during the present winter is not so large. Labor conditions are improving. Men were none too plentiful during the early fall, but since December 31st there have been plenty offering. Wages are the same as last year and the cost of supplies is also about the same. This year we will increase the quantity of our cut somewhat, owing to depletion of our stocks and fairly good prospects for the coming spring and summer trade. Prices will doubtless depend to a considerable extent upon the total production. If not overdone, prices should at least hold steadily, if based upon the cost of logging, etc.—The Pearce Company, Marmora, Ont.

United States buyers played a waiting game throughout most of the year 1913, particularly in the white pine trade and we do not expect much speculative buying from that quarter in the immediate future. We believe, however, that the outlook for the general trade during 1914 promises good fair business. Good conditions prevailed in the export trade to Great Britain last year. The markets for shingles and lath were strong. The volume of trade was greater than in 1912 and profits were also larger. Stocks are now considerably smaller than they were a year ago. Lumber prices were higher last year than in 1912. In some classes of low grades the prices advanced from \$2 to \$6 per thousand.—Shepard & Morse Lumber Company, Ottawa, Ont.

The volume of trade during 1913 was greater than during 1912 and profits also showed an improvement. Prices were better all around. We now have large stocks than we had a year ago. Shingles and lath have been slow. In our opinion the trade during 1914 will not be as active as during 1913.—J. Austin & Sons, Kinmount, Ont.

The volume of trade during 1913 was about ten per cent. less than during 1912 and profits were also about ten per cent. lower. Prices were not quite so high as in the previous year. Our stocks are about the same as they were a year ago. The demand for shingles during 1913 was fair and the demand for lath was good. We expect that the trade during 1914 will be about similar to that during 1913.—The Knight Bros. Company, Limited, Burks Falls, Ont.

A large manufacturing company in the Ottawa Valley report that they expect as good conditions and prices during 1914 as during 1913. During 1913 prices were considerably better, they state, in all grades, particularly in spruce and the higher grades of clapboards. Shingles, however, declined towards the end of the season. At the first of the season shingles sold at a better price than in 1912, but, on the removal of the duty by the United States, prices declined. The volume of trade last year was about 8 per cent. better than in the year previous. Exports of spruce were about double those of 1912 and prices were considerably better. Exports of birch were smaller, but the prices were higher.

Our trade during 1913 was greater than during 1912. Profits and prices were about the same. Stocks are now a little heavier. There has been a good market for shingles and lath. The outlook for trade during 1914 is fair.—The John Carew Lumber Company, Lindsay, Ont.

The volume of trade during 1913 was less than during 1912. Profits were about the same as in the previous year. Prices on mill culls,

dead culls, etc., were better. Stocks are about the same as they were a year ago. The markets for shingles and lath were good. Export trade to the United States and Great Britain was fair. The outlook for 1914 is for better trade than during the past six months.—Colonial Lumber Company, Pembroke, Ont.

The volume of trade was greater than in 1912 and profits were better. Stocks are now about forty per cent. less than they were a year ago. The demand for shingles and lath was active all through the year and prices were good. There has been an active demand all season for No. 1 and 2 cull pine, spruce and hemlock, also lath and shingles. White pine strips have been active at an advance over last season of \$2 per thousand. Cutting-up lumber is slow selling, with prices about \$3 lower than last season. Stocks at mill points and in retail yards are, we think, about thirty per cent. less than a year ago. We expect good trade during 1914, unless adverse financial conditions prevail.—Wm. Milne & Son, North Bay, Ont.

During 1912 the best price of hemlock was \$16. During 1913 it was \$20, but owing to the slight increase in wages and the much advanced cost of provisions, the increase in profits is only about fifteen per cent. There is practically no hemlock lumber in the manufacturers' yards today and retail yards have light stocks. The slackening off of the trade is really a benefit to our industry, for, were it otherwise, the trade would have to seek substitutes for hemlock and a drifting of trade from its natural channels is more or less detrimental.—Hocken Lumber Company, Limited, Otter Lake Station, Ont.

The outlook for the Canadian lumber trade looks good. We can see no reason for a poorer trade than during 1913. We think that the United States trade will hold about the same. Possibly it may improve by spring. The volume of trade was greater during 1913 than 1912. Medium and low grade stocks have been higher in price. The quantity of lumber on hand today is about the same as a year ago. Lath were higher throughout 1913.—The Cleveland-Sarnia Saw Mills Company, Limited, Sarnia, Ont.

Our sales were about double those of 1912, but our cut was smaller. Profits have been about the same as during 1912. Prices have been from twenty-five to forty per cent. higher than in the previous year. The demand for lath has been below the average and the demand for shingles above the average. We expect that trade during 1914 will be less active, owing to the general tightness of money.—G. T. Knight, Meaford, Ont.

As stocks are low, we think that the market will not be flooded during 1914. We also believe that there will be a good general demand for all classes of lumber, especially for hemlock and hardwood. We found profits on hemlock during 1913 about twenty per cent. better and on hardwoods ten per cent. better than during 1912. Hemlock prices have been about \$5 per thousand higher. The market for shingles and lath has been good.—Utterson Lumber Company, Utterson, Ont.

We did a slightly larger trade in 1913 than in 1912. Our profits and our prices were also better. Our stocks are now about the same as they were a year ago. Although we have had better prices than in 1912, expenses have also increased considerably. The movement of stocks has been fairly rapid and payments have been good, considering the tightness of money. We expect that during the early part of 1914 trade will be quiet, but that conditions will improve when spring opens.—Shortreed Lumber Company, Kearney, Ont.

The volume of trade during 1913 was about the same as during 1912. Prices were lower, with the exception of the box and cull trade, which were higher. Stocks are now about the same as they were a year ago. Lath are strong and well shipped up. The trade with the United States has been fair since the removal of the duty. We feel that the outlook for 1914 trade is merely fair.—Fraser & Company, Ottawa, Ont.

There was a greater volume of trade for the year 1913 than for the year 1912 and profits were better. Prices were about ten per cent. higher than during the previous year. Our stocks are about the same as they were a year ago. There was a good demand for lath during 1912. The export trade to the United States was good during the past year. We believe that the outlook for 1914 trade is fair.—Muskoka Wood Manufacturing Company, Limited, Huntsville, Ont.

The volume of trade during 1913 was greater than during 1912. Profits were better than in the previous year and the average price of lumber was about one dollar higher. Stocks are about the same as

a year ago. There has been a good market for lath during 1913. The export trade to Great Britain was fair. The outlook for 1914 trade is fair.—Pembroke Lumber Company, Pembroke, Ont.

Ottawa Valley camps in a number of cases are short of supplies and are suffering for want of snow to make roads. Unless more snow comes soon, the cost of hauling logs already cut will be greatly increased. Manufacturers' stocks today are about one-third less than they were a year ago. The outlook for 1914 seems to be bright.—M. N. Cummings, Westboro, Ont.

Shingles were in great demand during 1913 as a result of a large number of buildings being wrecked and unroofed during the storm last spring. This year we will put in a heavy stock of maple and beech. We expect that there will be a good demand for quartered maple and that beech will be a little lower, but in fair demand. We look for a heavy run of custom sawing, owing to the large quantity of timber blown down last spring.—Orrie Taylor, Massey P. O., Ont.

We did a larger trade during 1913 than during 1912. Our profits were about the same as in the previous year. Prices were about nine per cent. better. Our stocks are about the same as they were a year ago. The demand for shingles and lath during 1913 was good. We do not feel that the outlook for 1914 is very bright.—Laurence Bros., Canonto, Ont.

The price of good lumber during 1913 was low as compared with 1912. Mill culls, however, were high. Stocks are now about the same as they were a year ago. There has been a good demand for shingles and lath. The export trade to the United States was quiet and to Great Britain fair. The outlook for 1914 trade is fair.—Gillies Bros., Limited, Braeside, Ont.

The volume of trade during 1913 was less than 1912. Profits and prices were about the same as in the previous year. We have less stock on hand this year than a year ago. There has been a good market for lath. The export trade to the United States was about the same as in 1912. The outlook for 1914 trade is not very promising.—Spanish Mills Company, Limited, Spanish Mills, Ont.

We believe that the outlook for 1914 trade is fair. We do not anticipate any further decrease in prices. Stocks of logs will be much

lighter this winter. Several mill men in this section are not taking out any stock. We do not think manufacturers of lumber need worry.—Reid Bros., Lavant Station, Ont.

The outlook is that our trade during 1914 will be better and brighter than it was during 1913. Our profits last year were better than in the previous year and our volume of trade greater. Our stocks are now lower than they were a year ago.—Herman Weismiller, Bala, Ont.

The volume of trade during 1913 was greater than during 1912 and profits were better. Prices also were a little in advance. Stocks are now heavier than they were a year ago. The outlook for 1914 trade is favorable.—The Clyde Forks Lumber Company, Caldwell's Mills, Ont.

We believe that hardwoods will be lower in 1914 than in 1913. Hardwood logs are now selling on the Bruce Peninsula at \$3 per thousand lower than last year. Stocks of hardwood lumber are heavier to-day than they were a year ago.—Chas. Pedwell, Lions Head, Ont.

In our opinion the prospects for 1914 are not encouraging. Most of the mills are now carrying over large stocks and the amount of timber which must be taken out this winter or spoil, will be a serious handicap from the millman's point of view.—J. E. Murphy & Company, Tobermory, Ont.

Hemlock prices were \$2 higher during 1913 than during 1912. Basswood and elm were also higher. Other hardwoods and pine were selling at about the same price as in the previous year.—W. B. Davidson, Brighton, Ont.

We think that the lumber trade during 1914 will be good. During 1913 the trade with Great Britain was good. Stocks today are about 20 per cent. less than they were a year ago.—Georgian Bay Lumber Company, Waubaushene, Ont.

The outlook for 1914 trade is only fair. So far this year, we have had only about one inch of snow. Unless we get snow soon the log crop will be short.—Keewatin Lumber Company, Limited, Keewatin, Ont.

The better grades of hardwoods must advance in price during 1914. There is a good outlook for 1914 and the markets in the United

States are quite promising. Stocks are lower than they were last year.—The Stone Lumber Company, Marksville, Ont.

There was a greater volume of trade during 1913 than in the previous year and profits were better. Prices also were slightly higher. We have not so much stock on hand as a year ago. The outlook for 1914 trade is good.—Alfred Mitchell, Powasson, Ont.

We look for a fair season in 1914 with prices unchanged. Our trade during 1913 was better than the trade in the southern part of Ontario.—McCamus and McKelvie, New Liskeard, Ont.

We do not expect the lumber trade to be quite so brisk during 1914 as it was during 1913. There are indications of a scarcity in hemlock stocks.—Jacob Kaufman, Berlin, Ont.

Local trade conditions are fair, but we are unable to say anything about the outlook for 1914.—Estate A. McDonald, Peterboro, Ont.

Sales of Ottawa Pine Cuts

The Timber Trades Journal, London, England, in its issue of January 10th, says:—We understand that the usual annual contracts for the purchase of the Ottawa Valley cuts of pine have been concluded for next season's shipment at slight concessions in price for the first and second qualities, and on the same basis as last year for the thirds and fourths. As usual, J. R. Booth's cut has been purchased by J. Burstall & Company and Robt. Cox & Company, and the Edwards production has again gone to Watson & Todd. We learn that the over-wintering pine deal stocks are the lightest on record, especially in first and second qualities, and holders of these latter goods on this side should therefore stand out for a fair profit. Quebec spruce is held by shippers for higher values, but the reduction in freights will counterbalance the increase, and City St. John spruce is quoted at £9 for 7 and 8 in. The square timber selling season is close at hand, and within a few weeks we may expect the usual an-

nual visits of Canadian shippers, though unfortunately there are very few of the old brigade now left.

Ottawa Exports to the United States

The declared value of lumber exports, from Ottawa, to the United States during the calendar year 1913, as furnished by the United States Consul General's office was as follows:—
Lumber and Log products:—

Ash	\$2,904.97
Basswood	3,375.66
Birch	947.90
Cedar	692.28
Elm	246.00
Hemlock	10,841.06
Lath	106,602.04
Match Blocks	1,540.93
Mill Buttings	14,060.84
Pickets	36,492.87
Pulpwood	77,378.27
Railway Ties	15,603.44
Red Pine	9,394.32
Spruce	394,164.24
Spruce plank	23,884.32
Telephone and telegraph poles	937.95
White pine	1,511,422.86
White pine deals	41,482.04
White pine plank	1,667.46
White pine timber	4,278.16

Trade of Quebec Province During 1913

Business Favored the Manufacturer Rather Than the Wholesaler—Montreal Shipments Show Decrease—Encouraging Outlook for 1914—The Pulp and Paper Trade

Montreal, January 26th; (Special to the Canada Lumberman).—Last year might be well called the lumber manufacturers' year, 1912 having been the wholesale dealers' year, as far as profits were concerned. Strong advances in prices occurred during the fall and winter of 1912-13, and as a result manufacturers took advantage of this when selling their 1913 cut in the early part of that period. On account of light stocks and the good demand, business was profitable during the first five or six months, especially in spruce, hemlock and the lower grades of white pine, although good pine and square timber declined in value. About midsummer there was a falling off in sales, tight money being an important factor in this connection. Dullness characterized the remainder of the year. Hemlock and spruce dealers also began to feel the keen competition of yellow pine, which was dumped in large quantities and at very low prices into Ontario, Quebec and New Brunswick. Prices were so low, in fact, that they represented a heavy loss to the manufacturers.

In spite, however, of this decline in trade, quotations of spruce, hemlock and the lower grades of white pine held up very well, which was accounted for by the heavy shrinkage in the output of the lumber referred to, in Ontario, Quebec and the lower provinces. In these provinces alone, it is estimated there was a shrinkage of 200 million feet of spruce compared with the output of 1912. There was also less hemlock manufactured than in the preceding year. The cause of this reduced output was the late and rainy fall of 1912 and the early break up of the winter in 1913, which prevented the usual number of logs being made. The snow, too, disappeared very rapidly, with the result that the streams and rivers were very low, causing poor driving and the holding up of many logs.

The strike at St. John, N.B., was also another cause of the smaller output. Then the loss of mills by fire was the worst for many seasons. These mills could not be rebuilt in time to turn out lumber during 1913, although many will be ready for operation during the present year.

The manufacturers who were fortunate to get a normal cut during 1913 had a profitable period. Although some wholesalers complain that the past year was not as satisfactory as 1912 (which was a boom period), it will compare favorably, for the wholesalers, with 1911.

The tariff legislation in the United States had some effect on business in Montreal. While legislation was pending, many shipments were held up, with a view to getting the benefit of the new schedule, and after its enactment there was a decided revival in this section of the trade.

The following expresses the views of one of the oldest wholesalers in Montreal: "Taking the provinces of Quebec and Ontario and the Maritime Provinces, last year was a satisfactory and profitable period. During midsummer there was a time of dullness in the United States, which affected our market and shipments to the United States. It also caused, for a short time, weakness in prices in some lines; but this loss was recovered towards the end of the shipping season. Stocks of both spruce and pine at the mills are lower than for many years past, and should the spring and early summer demand for dry lumber be good, there will be a further advance in prices."

Local Trade Good

The activity in building operations was reflected in the retail lumber trade, and there were few firms that did not increase their turnover as compared with 1912. The building permits, a pretty sure index of the condition of the trade, showed a gain of \$7,623,406, this being for Montreal only, not counting the outlying districts which have separate municipal government. Many of the more ambitious schemes were postponed, owing to the financial situation, and some of these will be proceeded with this year. The chief demand in Montreal is for flats and residences, a demand which is not fully met, and it is in this direction that the great consumption of lumber must be looked for during 1914. At times, it was difficult to secure certain lines of lumber, particularly of dry stock, although prices ruled high, especially for spruce, hemlock and shingles. White pine perhaps was not in quite so strong demand, in consequence of the high figure it commanded, which led to other lumber being substituted. Yellow pine and B. C. fir took its place, while hardwoods have also come more into use for interior finish.

At times, collections were rather poor, this being the one serious drawback. But easier money is looked for, and should the financial condition improve to any marked extent, there is almost certain to be a very heavy demand for lumber during the present year.

The hardwood trade was brisk throughout the year, the great feature being the demand for plain oak.

Door and sash factories were steadily employed almost throughout the year, while box factories were well supplied with orders.

The Outlook for Future Business

With regard to the present year, prospects are undoubtedly bright. There are hopes of a let-up in the money stringency, and if the cut should be as small as indications point to, the market should have a decided upward tendency. Last year, at times, the orders for dry stock were far greater than could be supplied, and if this be repeated, quotations are certain to harden. Then, too, there is likely to be a good demand from the United States as the result of the removal of the duty, so that events tend towards a satisfactory year's trade at profitable prices.

Exports Showed a Decrease

Following an increase of 5,897,544 feet in 1912, exports from the port of Montreal fell away by 3,551,595 last year. It will be seen from the following detailed statement that the decline was more than accounted for by the smaller shipments of Mr. E. H. Lemay, who is understood to have very largely decreased his exports of birch. In other respects the amounts did not vary very largely.

	1913	1912
	Ft., B.M.	Ft., B.M.
Watson & Todd, Limited	34,596,642	33,217,881

Cox, Long & Company	1,878,741	2,211,896
Railways, steamship lines and small shippers	13,795,180	13,736,236
	105,819,167	109,370,762
Decrease, season 1913	3,551,595	
The following was the destination of the lumber:		Ft., B.M.
South Africa		4,011,701
Australia and New Zealand		264,074
Great Britain and Continent		101,543,392
		105,819,167

The year was not an eventful one in this branch of the lumber business. The high prices which ruled and the increase in freights were adverse influences, and sales in Great Britain showed a falling off. Firms on the other side hold very large stocks, and unless there is a drop in freights, the probabilities are that exports will be curtailed next season. Shipping is by no means as brisk as it was, and it is possible that with less cargo generally offering, rates may come down.

At the commencement of the past season, the shipping companies put on an additional 7s 6d per standard, but the exporters simply declined to send any cargo, on the ground that it was impossible to do business at a profit. The companies were thus forced to reduce the rates, and as a compromise knocked off 5s of the 7s 6d they attempted to impose. The action delayed shipments, which proceeded rather slowly all the summer, until near the close of navigation, when there was an unusual rush to get cargoes across. For a time, business was slightly interfered with owing to the Dublin strike.

Advices from Great Britain are not very optimistic as to next season. The great bulk of the shipments consist of white pine, and for the better grades of this lumber, and also for spruce deals, manufacturers are asking higher prices. One firm of exporters are holding off the market for certain lines, being of opinion that the prices quoted are too dear. The increase in values, of course, tends to a lower consumption, but this may be offset by lower freights. Canadian red pine continued to meet with great competition from Baltic pine.

A number of spruce deal cuts for next season have been sold at an advance on 1913 of one dollar and up per 1,000 feet.

Harbour Facilities Inadequate

Although the congestion at the docks was not bad during the past season, some Montreal shippers are of opinion that the Harbour Commissioners could make more provision for the trade. Following is the view of one of the exporters: "The Commissioners have failed

to give any facilities to unload C. P. R. cars at Windmill Point, having leased the land to the G. T., and as the Commissioners have not made arrangements to get C. P. R. cars over to this point, exporters must cart their goods from the foot of McGill street, a distance of about three-quarters of a mile at inconvenience to themselves and at a greatly increased cost. The Commissioners in their annual reports claim that they are cheapening the cost of handling freight at the Montreal docks, but what have they done for lumber exporters? Take the sheds and piers on the barbour as an instance. Instead of the exporters getting their cars placed alongside the sheds, they are compelled to hire carters to unload their cars from the different sections at considerable cost and inconvenience, losing much time in bad weather. The Commissioners' traffic department state that they are quite willing to place the cars alongside the sheds if we can get the railway companies to order the cars to the different sheds, but the sheds are too small and not equipped in an efficient manner. I believe that another storey should have been put on to the sheds, making three storeys instead of two, with the conveyors for the grain placed at the back of the sheds on the top, and with the front equipped with movable electric hoists or cranes, the same as Liverpool and other ports are equipped. The whole of the piers should also have been roofed over to protect any goods that are placed outside the shed, exposed to all kinds of weather. The dock wall running along Commissioners street should be put back to the harbour line, as it was shown in 1912 that the Commissioners had not enough trackage. This past season a different state of things existed, owing to the hay shippers shipping their products to the United States; but may not 1914 again show the want of more track room? 'Be ye always ready' is a good motto for all concerned. Suppose a lumber exporter is shipping 300 to 400 standards of deals for one steamer and the goods happen to be all rail goods, what is he up against? the exporter must allow some time to get the cars to the port; and if the steamer is delayed he has to face car demurrage, through no fault of his own. Surely some one is to blame? Either it is the Commissioners or the government who went over the plans of construction.

Further down the harbour, section 20, once alive with ocean steamers, is now deserted except for ferry steamers, and Hochelaga, once a thriving place for tramp steamers loading full cargoes of lumber the whole season through, is only used for coal boats. At Tarte Pier there is plenty of dirt and mud. The pier stood idle for some years, before it came into general use, but has not yet been paved. The sheds are too small, being only one storey high. They cannot hold half a steamer's cargo, and needless to say the lumber exporters have to put valuable lumber outside the shed exposed to the weather or else pay car rental. Steamers are becoming greater carriers every year, and larger steamers are being built for the St. Lawrence trade, and the Commissioners should be fully alive to the claims of all trades coming to the port. The grain trade is always to the front urging its wants, but the lumber business has also its claim to be considered by the Commissioners."

The Pulp and Paper Situation

The past year was one of the most important in the history of the Canadian pulp and paper trades, due to the tremendous new tonnage of news print which came on to the market through the increase in construction of mills. The quantity of new production was so large that some fear was felt lest it should seriously affect the market. The actual result, however, was that all tonnage was satisfactorily placed, in some cases it is true at somewhat lower prices, to meet conditions of general business. Naturally the mills had to seek markets outside the Dominion, and the production was largely placed in the United States, but it is interesting to note that a growing market for Canadian news has been found in South America. The sale of large quantities of Canadian news print in the United States placed manufacturers of that country in an awkward position. For a time they were almost in a panic, but they soon found that the situation was not as bad as they feared, and that there is likely to be business enough for all the machines in the United States, provided they run on paper in other lines which can be made on news machines. This is being gradually accomplished, and it is understood that one of the large syndicates will manufacture 400 tons of paper other than news print.

The tariff changed the whole aspect of news print manufacture in Canada. Under the reciprocity measure unless paper were made from farmers' lands' wood it was dutiable. In the fall the Underwood tariff admitted news print free of duty from the world without restriction. It is a question yet to be determined whether this is an unmixed blessing for the Canadian mills, because, unless good judgment is exercised mills may be constructed which would place so much paper on the market that it could not be absorbed, and it would then become a question of the survival of the fittest. It is generally recognized that this will be the situation in a comparatively short time, but it is hoped that the mills in existence who have cheap wood, power, and modern machinery will continue to find profitable

business for many years to come. The investment of capital in foolish enterprises which would tend to wreck such an important industry should be avoided.

As compared with 1912, the ground wood market last year was not satisfactory. Three mills were unable to dispose of their usual output, which was not surprising in view of the fact that about 450 tons per day of new production came upon the market. In considering the erection of pulp and paper plants in this country, the question of lumber and power have to be weighed, but the first consideration is as to whether the product can be sold this year or in the future. Undoubtedly some of the concerns floated have been over-capitalized, to the detriment of the legitimate pulp and paper enterprises of the country.

In the chemical pulp section there was a good deal of development. The explosion at one of the large mills resulted in rigid inspection of other mills by insurance companies and government officials, and the adoption of measures, at a great cost, on the safety first principle. Digesters were put out of commission in some mills and in other instances important repairs were made. A feature of the year was the installation or coming into use of new plants, such as the Wayagamack, at Three Rivers, P.Q., the Dryden, at Dryden, Ont., and the increased production of the La Tuque mill, for kraft; the enlargement of four other mills manufacturing sulphite fibre; with two new sulphite mills under construction—one in Gaspé and the other at Shawinigan Falls, P.Q. It is estimated that some 350 tons per day will be added to the production, and the completion of these plants will furnish amply sufficient capacity to cover all the demands of the Canadian market and to export a large quantity to the United States.

In fine papers, new mills at Beauharnois, St. Adele and Thorold have added very largely to this class of goods. In coarser papers business has been dull owing to over-production by one of the large mills.

Some splendid news print plants were erected during the year. These include one at Thorold by the Ontario Paper Company, one at Donnacona, by the Donnacona Paper Company, and one at Fort Frances by the Minnesota and Ontario Company.

Looking at the situation from a general viewpoint, there is a feeling that Canada, with her valuable lumber resources, and the largest water powers on the continent, has advantages which can be turned to very profitable account, and that, in the pulp and paper trades, some substantial advances will be made during the present year.

Timber Measured at Quebec

Quebec, December 31st, 1913.

The following comparative statement of timber measured and culled during 1913, 1912 and 1911 is furnished by the Supervisor of Cullers, Quebec, P.Q.

	1911	1912	1913	1913
	Cubic feet	Cubic feet	Cubic feet	No. of pieces
Waney white pine ...	836,840	1,172,720	244,280	4,517
White pine	10,680	1,760	7,560	261
Red pine	27,720	12,200	960	25
Oak	133,280	113,840	177,240	3,133
Elm	221,680	313,640	284,880	6,457
Ash	120	520	1,000	39
Birch	71,560	42,920	47,680	2,393
Total	1,301,880	1,657,600	763,600	16,825

In addition to the above, the 1913 returns show 83 pieces of walnut, measuring 1,320 cubic feet, and 10 pieces of hickory measuring 360 cubic feet, making the 1913 total 765,280 cubic feet.

Stocks are now much lighter than they were a year ago. We now have nothing on hand. Prices showed little variation during 1913 as compared with 1912, although the local market was rather better. The trade with the United States has been rather disappointing and the benefits expected after the removal of the tariff were largely discounted in advance. Trade with Great Britain was good until near the end of the season. We expect only a fair export trade, but a very good local trade.—J. D. & P. A. McGregor, Limited, New Glasgow, N.S.

The annual statement of the traffic of the Lachine Canal at Montreal, which connects the upper and lower St. Lawrence, shows that pulpwood and pulp for Great Lake ports was the largest tonnage up. There were 126,938 cords of the former, equal to 380,814 tons, and 13,100 tons of pulp. Two cargoes of pulp from Norway passed through the canal, totalling 2,731 tons.

Mr. T. J. Rutherford, president of William Rutherford & Sons Company, Limited, Montreal, has been elected a member of the committee of management of the Western Hospital, Montreal.

Quebec's Exports to United States

**Pulpwood, Pulp and Paper All Show Extensive Increases—
Exports Decreased—Analysis of the Trade**

The following analysis of the export trade of the province of Quebec with the United States was secured by the Canada Lumberman from the American Consular Office at Quebec, P.Q.:

The Quebec Consular District, by virtue of the annexation of the vast territory heretofore known as Ungava, and now designated as New Quebec, has become probably the largest Consular District in Canada. Roughly speaking, it is bounded on the west by the 73rd degree of longitude from the state line of Maine north to Hudson Strait, on the east by Labrador and on the south by the Gulf and River St. Lawrence and the northern boundaries of the States of Maine and New Hampshire.

This great territory, it is freely predicted, will in time become the greatest pulp and paper producing district on this continent, if not in the world. These industries are as yet in their infancy, but the vast spruce and balsam forests still available, despite the many and disastrous fires that have swept over them, are bound to develop rapidly, and to an extent hardly realized at present.

Though many of the best limits have already been secured for pulp and paper mills now in existence, there are equally good and extensive ones left, awaiting development. Numerous waterpowers, some of great magnitude, are capable of furnishing power for the largest of mills, that can be economically built, and with ready means of transportation by water and rail also at hand, besides climatic conditions which insure plenty of snow in the winter, hence a good water supply in spring, and favorable labor conditions, there is no reason why the prediction mentioned should not be realized.

That these great natural advantages of this section are being more and more appreciated by intelligent people at home and abroad, there can be but little doubt. The Government of the Province has awakened to the fact, that it is the part of an enlightened policy to make every effort to protect its public domain from devastation by fire, which has already consumed infinitely more of its forests than ever has the axe of man. Fewer fires have been the gratifying result. A more rational method of timber cutting has been enforced, and some beginning at reforestation has been made.

Pulpwood Exports Still Increasing

It has also been considered desirable to stop exportation of the raw wood from all lands over which the Crown has retained control, in order to insure its use in manufactures of pulp or paper at home, and to force, if possible, pulp and paper manufacturers elsewhere to locate in this province. This measure, however, does not seem to have had the desired effect so far, for as will be seen from a subsequent table, as much pulpwood is exported from this Province as ever, owing no doubt to the fact, that the privately owned timber lands, though a relatively small portion of the total forest area of the Province, are nevertheless capable of supplying the demand, and unquestionably will do so for a considerable number of years to come. These wood exports, nevertheless, have not retarded the development of the paper and pulp industry in the least. In fact it is perhaps far better, that these industries should have a gradual and normal growth, rather than receive a sudden impulse from adventitious conditions. The pulpwood paper industry of Quebec is bound to expand gradually, naturally yet enormously, because all conditions favor such growth. This is best illustrated by the statement of a few figures, which in this instance do not lie, because they represent values of shipments actually made and exported. Thus it appears that the exports of newsprint paper from this district represented the following values: 1905, \$640; 1906, \$8,018; 1907, \$29,228; 1908, \$44,643; 1909, ———; 1910, \$173,561; 1911, \$211,618; 1912, \$270,081; 1913, \$1,059,597. To come up from practically nothing to over a million dollars in eight years, is certainly doing something, and this is but the beginning.

Pulp also shows a remarkable growth in exports, and during the same period presents the following values: 1905, \$29,704; 1906, \$22,951; 1907, \$209,538; 1908, \$230,362; 1909, \$264,558; 1910, \$765,131; 1911, \$1,273,868; 1912, \$1,807,958; 1913, \$2,256,336. divided in almost equal proportions between mechanically ground, and chemically bleached, or sulphite pulp. These figures certainly bear eloquent testimony to the growth of the pulp industry, which also is bound to continue, though perhaps not as rapidly as that of paper, which from now on will make record leaps, stimulated, as it undoubtedly will be to some extent, by the removal of the American duty, though the exports by months during 1913 since the date of the removal of the duty do not indicate an appreciated increase in the exports of either pulp or paper, on account of the removal of the duty.

It might now be gratifying to some to read, that in the face of the foregoing figures, there has been a corresponding falling off in the exports of pulpwood. This, however, has not been the case, for these exports during the same years were valued as follows: 1905, \$281,819;

1906, \$239,726; 1907, \$385,941; 1908, \$636,186; 1909, \$1,160,029; 1910, \$1,702,644; 1911, \$1,290,500; 1912, \$1,480,862; 1913, \$1,691,775; from which it appears, that the exports in 1913 almost equalled those of 1910, when the fear of an impending shortage of this wood was largely responsible for an increased exportation. The fact, that the New National Transcontinental Railroad has tapped the lower tier of counties of this province to the south of the St. Lawrence River, with great timber resources, hitherto cut off from a good market, is more likely to keep up the supply for years to come, though the wood exports generally are not on that account likely to increase in the same proportion as those of paper and pulp.

Decrease in Lumber Exports

The lumber exports on the other hand in 1913 from this district show an actual decline, small though it is. The following table will show best the relative values for the last two years of forest products including timber:

Articles	1912	1913
Balsam fir	\$4,567	\$5,038
Cedar poles	2,035	751
Deals	100,089	17,632
Laths	44,920	38,314
Lumber	1,087,386	1,063,125
Railroad ties	10,324	10,461
Shingles	848
Total	\$1,250,170	\$1,135,221

From this it will be seen, that the lumber exports declined by about \$25,000 and the miscellaneous exports of forest products, aside from pulpwood, pulp and paper to the extent of nearly \$115,000. The total value of all products of the forests from this district in 1912 was \$4,817,574, out of a total of all exports of \$6,219,423 and in 1913 \$6,143,032 out of a total of exports valued at \$7,471,113. This represents an increase for the year 1913 over 1912 of \$1,325,457 in exports of forest products and of \$1,261,690 in the total values of all exports from this district.

Unique Year for the Lumber Trade

Editor Canada Lumberman: Montreal, January 12th, 1914.

The year 1913, with regard to the lumber trade, has been unique in many instances. Although money was tight and building operations decreased, the price of spruce advanced steadily; a rather strange situation, since all other commodities decreased in value. However, this is easily explained, when one considers that the lumber operations last winter were very unfavorable and the output was far below the usual production. The supply never overran the demand and manufacturers had at all times the upper hand.

This is further emphasized since spruce did not come down in price when the duty was taken off. At first, prices fluctuated but they soon settled to where they were before the tariff reductions.

Shingles suffered a reduction because the market was over supplied. This seems to be always the case with shingles. When prices are good manufacturers try to increase their usual production and soon again crowd the market. Then the mills will curtail their output or cut it out altogether and one fine day the trade finds no shingles to buy. If manufacturers always tried to be on the short side of supply, they would be able to keep prices high and steady at all times.

The demand for lumber in Canada has not been nearly as good as across the line. The last three months of 1913 were particularly poor. Tight money was the main reason for this. Retailers were forced to turn their stock into money. Necessary items only were bought, and the result today is that nearly all retailers have the lowest stock on hand they ever had, some of them have reduced it sixty per cent. This will have its good effect this year.

Dry spruce lumber this winter is very scarce. Few mills are wintering stock, but the conditions are very advantageous for the new cut and the outlook seems to indicate an over-production compared with previous years. On the other hand, money promises to be easier soon. Some expect it to be normal within a few months. With the monetary market normal, building operations will resume their activities and the demand for lumber will be stimulated. Any surplus which may be produced will be devoured by the hungry retailers, who have only pile bottoms to look at this winter.

Shingles, we expect, will be the only commodity, with perhaps lath, which will come down in price and this because mills have not curtailed this year's cut. Several new mills are starting throughout the country for the sole manufacturing of shingles. It is deplorable, but it cannot be helped.

In conclusion, with the tariff question settled for shipments across the border and with the present prospects of easier money soon, general business will brace up, lumber business will respond quickly, and 1914 will show a marked progress.—U. E. Germain, Manager, Saw-mill Owners Sales Company.

New Brunswick Output Shows Decrease

Stocks on Hand Also Below the Average—Prices Steady During 1913—Tariff Removal by U.S. Causing Important Industrial Change

St. John, N.B., January 22nd (Special to the Canada Lumberman): Outside of the city of St. John and throughout the province of New Brunswick the year just passed has been to the manufacturers and shippers of English deals one of the most successful which could be wished for. Practically from beginning to end there has been a steady market in Great Britain, with only a slight easing of prices in the early fall, which did not in any way influence the market on this side as about all the deals had been placed ahead. All the mills through the province had only a fair supply of logs. Last winter being exceedingly mild, the lumbermen were unable to get out an average cut. Hence it is felt that, when all statistics are completed, the shipment of deals to Great Britain will not be much greater than in 1912.

The prices of deals remained good all the year through. City cut deals, or deals manufactured from the large stationary mills with the most modern machinery were sold in the early spring at about \$16 to \$16.50 per M. for specifications running 50 per cent. 9 in. and up, balance 7 in. and 8 in. x 3 in., with 3 in. x 4 in.—5 in. at \$14, 3 in. x 6 in., \$14.50, 7 in. x 2½ in., \$15 to \$15.50, ends, \$12 and 4th quality, \$14. These prices were the ruling ones until about July, when a further advance took place and deals were sold at \$17 for above specifications, with a like advance in scantlings, ends and fourths. The year 1913 was a record breaker, in as far as the prices for English deals were concerned. In no year has the prices been as high or the demand any better. All the benefit of the high prices did not, by any means, go into the pockets of the manufacturers, which is usually the rule. The middleman, or broker, has in about every case gathered the cream, having had the deals practically all bought in the early season. The markets in Great Britain kept climbing and it is said that 1913 was one of the most successful years in the history of the lumber broker. We must say here, that he is many times entitled to all he gets, as he takes very heavy risks in both buying and selling.

The years which are profitable, are not so unpleasant as the years which are not profitable, of which the lumber brokers in this province have had a number. Practically all the deals throughout the province of New Brunswick are handled from the brokerage houses of Mackay, McKean and Moore, with offices at St. John and branches in Great Britain. These are all reliable houses and we hope that prosperity shall continue with them during the coming season of 1914.

The Course of Freight Rates

Freights, at the beginning of 1913, were very high. Nearly all the summer charters, which were made during the winter and early spring were made around 55 shillings, but during the summer they began to be easier, until to-day, charters for 1914 business are being made around 38 shillings and 9 pence, which the shipping brokers claim to be as low as they can be had for future business. The shippers of English deals, of course, had the benefit in some cases of the fall in freights, especially during the autumn, when a slight drop came in the prices in Great Britain and he did not feel this drop in many cases, as he had the advantage of the drop in freights.

One of the causes of the increase in shipments from St. John to Great Britain was the state of trade in the United States, which was practically at a standstill, and therefore much lumber which would have gone into the United States had to be sawn into English sizes and shipped over to Great Britain. Another factor was, that, at the time of the strike, a good quantity of deals were purchased at outside points and diverted through St. John.

As to the outlook for trade with the United Kingdom during the coming year, it is as yet impossible to see very far ahead. The stocks for shipment from the province of New Brunswick are, in some cases, lighter than at this time last year. In other sections they are about the same. On the Restigouche, about 10 millions are being wintered; on Miramichi about 10 millions; at St. John about 20 millions, which is a little more than held here last year, but northern New Brunswick is below the stock held last year by a large quantity. Only a fair cut of rotary deals is being put out along the railways and at interior water points. Many of the portable mill men did not start cutting as the buyers were hesitating during the early fall when the portable mill man has to form his plans and get into the woods. So, there will not be any over-production, so far as they are concerned. Only an average cut of logs will be taken out for the mills over the province, and if forecasts are worth anything, much of this will be turned to the United States, where it is expected that prices will increase for 1914. So, as far as New Brunswick stock is concerned, the effect it should have upon the English deal trade should not be above normal. Of course, stocks of Baltic goods are fairly heavy and may have some

effect upon the spruce trade, as they are, and have been, one of the greatest factors in keeping the prices of spruce down.

Logging Costs Advancing

So far as the cost of logging is concerned, it will be higher in 1914 than in 1913. Men have been exceedingly scarce, in fact have never been so hard to find in this section for logging purposes. Operators are paying from \$5 to \$10 per month more for men than in 1913, and it is felt that the cost of putting up the logs this year will be from 5 to 10 per cent. higher than in 1913. Although the winter has been very favourable, with the exception of the early fall, the quantity of logs put up, to date, is not as great as in 1913, caused largely by the poorer class of labor and its scarcity. No great quantity of deals will be shipped by liners, and although stocks are now very heavy in London, Glasgow and Manchester, should the consumption keep up, a large quantity will be worked off. Money, of course, is loosening up to some extent, and if trade in general should improve and no labor troubles arise in Great Britain, there is no reason to doubt that the year, or early part of the year at any rate, will bring forth good business and good prices.

As to the trade at St. John during the past year, the manufacturers have had a very discouraging season, all on account of labor asking too much and the closing of the mills for three months, when practically no work was carried on, and overhead charges were going on just the same. The operator, on closing his books for the season, finds in many cases that, if he broke even, he was very fortunate indeed. The trade started the year with a grand outlook. The plans made here for a great quantity of building would use up all the low grade material as fast as it was manufactured and at good advances in price. Also, the prices for English deals were good. A fair stock of logs had come forward or would come forward through the summer and all would be well, but a stop was put to all this when labor stepped in and said no, and all plans were turned aside, and mills closed. Lumber was brought in to the city from interior points, at good prices to the sellers. All the mills here could do was look on and see someone else benefit by what should have rightfully belonged both to employer and employee. This state of affairs went on for fully three months, and when the mills started again, the bottom had fallen flat out of the building trades, and the mills therefore received no benefits, no advance in wages was given to the operators as it was felt that the mill men were paying all the wages they could afford for some time to come, as, for the past few years, the mills have not been making any money, the result largely of the increased cost of labor.

The stock of deals here totals about 20 millions for the English market, and from 5 to 8 millions of American; laths about 5 millions. All spruce boards and low grade lumber have about been cleared up. Stocks of dry pine are very scarce, having all been shipped at the time of the strike. While quite a stock of green pine is on hand it will not be ready for shipment until about July. The market for pine is dull, with the outlook for 1914 uncertain, but the stock of pine logs will be very light.

Light Stock of Logs at St. John

The stock of logs on hand at St. John is not by any means heavy. It would total about 20 millions and these are in the hands of a very few mills. The woods operations are doing fairly well but have been handicapped very much by the wet weather of early fall and the scarcity of labor. Up to the present time only a fair quantity of logs have been put up. Good quantities of snow have fallen and hauling is now well under way. About 60 to 65 million logs are being cut for the St. John mills this winter. This is a smaller cut than usual, owing to a late start being made on account of the strike. So it is to be seen that the year 1914 will be a short season for largely all the mills in the city of St. John. About 54 millions of logs were rafted through booms in 1913, with a cut of about 15 million of bank logs below Fredericton. The sawing season was short. Quite a stock was held from 1912 to 1913, about 40 to 45 millions, which meant a cut of about 100 million in 1913, but, the mills being shut down only about 80 millions were manufactured, leaving about 20 millions held over to 1914 or less than half the stock held from 1912 to 1913.

The trade with the United States was about as unprofitable as it could be, from beginning to end of the year. The New York market was dead. It was not a question of prices, but it was almost impossible to find buyers for long lumber. Occasionally some sales were made but it was simply a hand to mouth business. Sales of random were made at about \$21 per M. for good fair specifications of lengths and widths. In New England, the market also was very uncertain.

During the early part of the season the base price was about \$25, but it only held for a short time, when it dropped to \$24 with buyers scarce. A great deal of the trouble in the American market was traced to the scarcity of money for building purposes, the banks having about withdrawn their support from the builders and refusing to advance money to buy land or build houses. This, along with the uncertainty of the tariff and its effects, with all the railroads practically out of the buying, reduced the United States market for eastern lumber to a very bad state. Laths were about the only stock that kept at good prices. They netted the manufacturers about \$3 at the mill for the whole season. Shingles were hard to sell, especially the high grades. Of course, the low grades are being used largely by the people at home, as they are much cheaper, and at present the consumer is frequently looking for something which may serve the purpose at a lower price. Large quantities of shingles are being held at the present time over New Brunswick, and throughout Maine. One of the greatest competitors which the eastern shingle is brought face to face with is the British Columbia shingle which is now coming on the market very freely since the tariff has been removed, and here let me say that one of the greatest competitors which the eastern manufacturers, both Canadian and American, will have to face in the near future will be stock from British Columbia. This applies especially to the woodworking factories, which are now buying all kinds of doors, trim and interior finish from British Columbia, bringing it right across the continent and selling it in the provinces of New Brunswick and Nova Scotia. What will happen when the Panama Canal is opened?

As to the outlook for the United States market during 1914, it is felt that it will be much better, now that the tariff questions are settled. The money question is being put on a better basis than before, and the railroads will undoubtedly be allowed to increase their rates, and if they do so, the much needed repair work will be taken up. So there is no reason why we should not at least come back to a normal market in New York and New England, with at least an advance of from \$1.50 to \$2 per M. In fact, some offers are now being made by American purchasers here, but they are not finding the sellers ready to do business as yet.

Very few changes are being made in the milling plants in this section, and no new plants are in the process of erection. No sales of deals have taken place as yet, and sellers feel that it is much better to await developments. The stock of logs will not be any more than will take care of a poor market. So if there is any business at all prices must stiffen.

North Shore Operations During 1913

The lumber shipping season during 1913 on the North Shore of New Brunswick was an active one, many of the ports showing a good increase. Among these the following totals show the results of the year's operations:—

Year	Dalhousie		
	Vessels	Tonnage	Sup. Feet
1912	33	43,324	15,909,671
1913	41	52,258	16,000,000
	Bathurst		
	Vessels	Tonnage	Sup. Feet
1912	10	11,319	7,615,378
1913
	Newcastle		
	Vessels	Tonnage	Sup. Feet
1912	20	24,898	33,494,529
1913	16	15,056	22,103,758
	Chatham		
	Vessels	Tonnage	Sup. Feet
1912	31	32,243	45,623,040
1913	22	36,580	52,384,955
	Richibucto		
	Vessels	Tonnage	Sup. Feet
1912
1913	3	2,672	1,594,990
	Buctouche		
	Vessels	Tonnage	Sup. Feet
1912	1	246	287,556
1913
	Campbellton (British Ports only)		
	Vessels	Tonnage	Sup. Feet
1912	19	30,047	35,152,226
1913	26	39,556	54,351,943

Sixteen professional trained foresters, nearly all of whom secured their training at the forest school at Laval University, Quebec, are now employed in the Forest Service of Quebec province. During the summer of 1913, the Forest Service had fourteen parties in the field, each in charge of a technically trained forester. Ten of these parties were engaged in valuing unlicensed Crown timber lands, of which there are approximately 125,000 square miles in the province. The Crown lands under license totalled approximately 70,000 square miles. During recent years, the revenue from these lands has been about \$1,750,000 annually. Four parties were also engaged last year in an

examination of licensed lands, to determine the boundaries of permanent forest reserves. The Quebec government is working out a policy of segregating non-agricultural forest lands into permanent forest reserves.

St. John Shipments Showed Increase

The annual review of the lumber shipping trade of St. John, N.B. with trans-Atlantic ports, published by the Daily Telegraph, states that these shipments were fairly heavy and showed an increase over 1912. During 1913, 155 vessels loaded lumber at St. John and the cargoes totalled 86,538,622 superficial feet; while in 1912, 161 vessels loaded 82,040,963 superficial feet—an increase of 4,497,659 feet for last year, although there was a decrease of six in the number of vessels. Timber shipments for the year 1913 show a slight reduction. The decrease in sailings is principally due to the fact that there were ten more Liverpool boats and five Australian boats during the previous year.

The following table shows the comparative shipments during 1913 and 1912 to the various trans-Atlantic ports:

	No. of Vessels	Tons	Deals, S. Ft.
Liverpool, 1912	43	279,103	19,178,393
Liverpool, 1913	33	217,214	16,885,275

Shipments from the port of Dalhousie were:
Forty-one vessels, 52,258 tons; 16,000,000 superficial feet of deals, etc., 33,000 cords pulpwood; 8,000,000 laths; 2,500,000 shingles.

Shipments to the United States

More than a million and a half dollars worth of lumber was shipped from St. John to ports in the United States during 1913. The quantity exported during the first quarter was considerably smaller than during the other quarters. The long lumber shipped amounted approximately to 45,486,000 feet, while the shipments of laths and shingles totalled about 113,155,000 and 8,248,000 respectively. The values of the different kinds of wood products shipped during the year, as furnished by the U. S. Consul's office, were as follows:—

Product	Jan.-Mar.	Apr.-June	July-Sept.	Oct.-Dec.
Lumber	\$159,717.89	\$198,789.59	\$259,712.29	\$155,058.54
Wood Pulp	89,482.09	70,794.41	62,812.44	105,097.56
Shingles	982.50	13,743.62	..	6,748.50

Total	\$297,539.34	\$453,432.61	\$405,647.40	\$370,140.34
Grand total for year	\$1,526,759.69			

St. John Trade's Markets Not Promising

A St. John, N.B., correspondent, writing to the Canada Lumberman says:—

In the early spring of 1913 prices were obtained that were higher than for many years past, although the prevailing high rate of freight reduced the f.o.b. value of the lumber. Then, later on in the season, when the English market had slumped, freights took a turn upwards, but only temporarily. At the very end of the season, freights were much below those of any other time during the year. The production last year was moderate, owing to the poor hauling conditions and the short season, but the manufacturers undoubtedly had a prosperous year, as they all sold their stocks at good paying prices.

The United States market was exceedingly disappointing. Early in the spring everything pointed to good business, but owing to money stringency, and pending United States legislation, the market disappeared entirely.

We are having good seasonable winter weather here so far, with sufficient snow to make good fair hauling, and if these conditions continue, the production will, perhaps, exceed last year's.

As to this coming season's market, it is quite impossible to say anything at present. The large United States handlers of spruce apparently have little faith in any volume of business. In the United Kingdom, as usual at this season of the year, business is very quiet, and buyers are hard to be found for the small parcels going forward by liners, and prices for the spring and summer, will undoubtedly be very much lower than last year.

A Manufacturer's Review of New Brunswick Trade

Editor Canada Lumberman: Bathurst Village, N.B., Jan 17th.

The lumber trade in New Brunswick is not as active as it was twelve months ago. We are affected here, much the same as in other parts of the world, by the general tightness of the money market. This has interfered seriously with all kinds of development and consequently there has been a slackening down all along the line. This will ultimately work out for our general good, as there was no doubt at all that the pace was a little too fast, and at least some doubtful enterprises were being launched, which were better deferred. On the whole, however, trade for 1913 was satisfactory except, of course, that collections were not as good as in 1912, but this is now coming all right.

The cut of lumber falls considerably under that of 1912 and much below the average for the past few years. The stocks on hand are considerably less than usual and most of what is on hand has been sold by the manufacturers to the wholesalers and is now in process of being shipped out. This, of course, refers to mills situated so as to ship their lumber out by rail. Mills that can only ship by water cannot load out their remaining stocks until navigation opens up next spring. With anything like an ordinary demand there will be practically nothing left on the yards by the time the sawing season opens up next spring. Prices have ruled steady throughout the year, which is remarkable in view of the general slackness in most lines of trade. The short cut, of course, influenced this, and further, the removal of the American duty was a great boon to the Canadian lumber trade in general and especially so for the Maritime Provinces. This affects not only the lumber trade but also benefits every line of trade and industry. Many of the old time saw mills built for making 3 inch. deals for the British markets are being replaced by more modern plants adapted for sawing for the American trade. The time is not far distant when the marking of 3 in. deals in this part of the world will be a thing of the past, unless a very radical improvement is made in British prices, and this does not seem likely. The result is bound to be that all badly located mills will go out of business shortly unless they can modernize and locate where they can ship by rail as well as water.

The Timber Lease Situation

One very important matter affecting all lumbermen in New Brunswick, settled during 1913, is the matter of the Crown Land leases, which expire in 1918. The provincial government enacted a law permitting all holders of leases to renew their licenses for another term and as practically all holders have accepted the terms, it must be taken for granted that the law is, at least fairly satisfactory to them.

So far as conditions for 1914 are concerned, it is a little too early yet to say much as to how the markets may rule. There is no doubt at all that money is easing and confidence generally is being restored. If this continues for another thirty days or so, trade will begin to improve and we will very soon be back again doing business full swing. Basic conditions are sound and with anything like normal money rates, we should have a good year's trade. Businessmen generally are optimistic and they have every confidence in the outlook. The opening of the American markets for so many of our products is bound to have a great influence on all Maritime trade, owing to our proximity to these markets.

The present federal government of Canada is greatly improving

and extending the harbor facilities at important shipping points in the Maritime Provinces and showing a great interest in our shipping trade. At Halifax and St. John, tremendous developments are taking place in the building of piers and wharves and in dredging, and at Bathurst very important dredging work is in progress, which, when completed, will make Bathurst a splendid harbor. Ocean going vessels, both steam and sail, will take full cargoes from this port to any part of the world. Large pulp and paper plants are locating there and these improvements are absolutely necessary for the business of the place.

Lumbering conditions to secure the new logs for 1914 sawing have been quite favorable up to the present, and indications are that the cut will be larger than in 1913. Practically all the new logs are now cut and yarded, and the hauling off work is in progress. Hundreds of men and teams are busy drawing the logs out of the woods all through the province, and placing them on the rivers where they will remain until the spring freshets float them down to the mills where the sawing is done between the 1st of May and 1st of December. A great deal depends upon the success of our drives in this country, so far as the cost of the logs delivered at the mills is concerned. During the past two years, conditions were unfavorable and the drives very expensive. We are hoping for better things this year on the driving end.—Angus McLean.

New Brunswick Trade Conditions

A prominent New Brunswick manufacturer, discussing trade conditions during 1913, states that the volume of the lumber trade was less than during 1912, but that prices were somewhat better. Stocks on hand at present are not over a quarter of what they were a year ago. The markets for shingles and lath during 1913 were better than they have been for years. The export trade with the United States was quiet during the early summer, but improved when the duty was removed. In connection with the export trade to Great Britain, freight rates opened high during 1913 and the quantity exported was less than formerly. Prices on the British market, started out, based very largely on the same f.o.b. value as in 1912. Later in the season freight rates eased off giving shippers from New Brunswick something of the benefit. New Brunswick shippers are the speculators in the trade market and in this instance derived the benefit. It more frequently happens that they are the losers on account of the advancing freight rates instead of the gainers.

Contracting for 1914 stocks has hardly commenced as yet. British buyers are talking about lower prices and United States and Upper Canadian buyers report that trade is dull and the future uncertain. The quantity of logs being taken out in New Brunswick this winter will show a reduction and the cost of production will be from \$1 to \$1.50 per thousand more than it was last year, as a result of increased wages for the men and increased cost of provisions. The writer believes that the markets will respond to this additional cost.

Partington Company's Operations

Lumbering conditions in the Province of New Brunswick are excellent at the present time, according to Mr. Sydney M. Jones, of the Partington Pulp & Paper Company, St. John, N.B. The cut of the Partington Company will be smaller, owing to the fact that there was a two years' supply on hand last year. The cut this year will be less than half the usual amount. The plant consumes about 18,000,000 feet of pulp wood in the manufacture of its product each year. A new spur track from the Canadian Pacific Railway to the mill has just been completed and is about a quarter of a mile long. Heretofore the company has used automobiles for transporting the pulp over this distance to the cars, but now that will be done away with. There has also been a new storehouse erected, which is 150 feet long and 35 feet wide. A conveyor connects the mill with the loading platforms at the storehouse.

The receipts for 1913 from the lease of New Brunswick timber limits and from stumpage amounted to \$501,554.05. This is about \$20,000 less than the receipts in 1912 and \$27,000 less than in 1911; but the falling off was due to a reduced cut of logs because of dull markets. The growth of revenue from the crown lands is indicated by the fact that the total receipts in 1890 were only \$140,291; in 1895, \$151,263; in 1900, \$175,818; and in 1908, \$343,291. This year's receipts, in addition to the \$501,000 for stumpage included also \$255,335.76 in bonuses on timber leases being renewed for a new term of years.

The export trade to the United States showed lower prices during 1913 than in the previous year, but after the removal of the duty, results were equally as good as in the former year. The volume of trade during 1913 was greater and profits and prices were better than in 1912. Stocks are now about the same as a year ago. Favorable conditions have prevailed in the markets for shingles and lath. The export trade to Great Britain has shown no change. The outlook for 1914 trade is fair.—W. W. H. Miller Company, Ltd., Campbellton, N.B.

Nova Scotia Lumber Trade During 1913

Home Market Steadily Increasing—Prospects for Present Year Still in Doubt—Shipments from Parrsboro, Windsor, Liverpool and Other Important Ports

It is not an easy matter to get accurate figures concerning the lumber output of Nova Scotia. The large shippers, of course, keep correct account of the quantities they handle, and their figures are easily available for statistical purposes, but there are many small operators who are more interested in getting out all the logs they can "while the sledding lasts" than they are in keeping a record of the exact number of feet in their winter's cut. This being the case, it becomes necessary for those who prepare lumber statistics to estimate a portion of this output, and, no matter how well qualified they may be to estimate correctly, experience has shown that they are as likely to disagree as the proverbial doctors. For instance, one gentleman, who should be an authority, as he is Deputy Crown Land Commissioner, estimates the cut of last year at "about 450,000,000 feet," which, he says, is "a decrease of 50,000,000 feet on the cut of 1912." He also says that "for many years the annual timber cut has been in the vicinity of 500,000,000 feet." Another gentleman, who should also be an authority on the subject, estimates "that the lumber cut of this province for 1913 would total about four hundred million feet, which is a fairly average cut." It will be seen that one of these estimators not only places the cut of last year about fifty million feet below the figures given by the other, but also reduces the annual cut of the province about a hundred million feet below the estimate first quoted. This wide divergence, which has a tendency to lessen the value of the estimates, may possibly be explained by the use of different standards in reaching the conclusions, but it is probable that both authorities were too conservative in their calculations, and that they failed to make sufficient account of the vast and rapidly increasing quantities of lumber used every year for pit timber, railway ties and barrel shooks.

The estimates of the value of the lumber output differ much more widely than those concerning its quantity. The valuations of last year's cut, as published in the provincial papers, range from \$1,800,000 to \$6,000,000. The first of these estimates is simply ridiculous. Assuming that the total output is four hundred million feet, which is the lowest estimate, the price, according to that showing, would be only \$4.50 per thousand feet. The price of lumber last season would probably average about three times that amount, and some grades were quoted in the early summer at \$18.00 per thousand, f.o.b. Some manufacturers of statistics are evidently poor guessers.

Presumably the records of all lumber shipments are kept at the custom houses of the various ports, and it should not be difficult to obtain correct returns. It would seem, however, that some newspapers prefer to deal in generalities rather than take the trouble to collect definite statements of fact. The result is a large amount of guess work and very little reliable information.

Shipments From Port of Parrsboro

The shipments of deals, scantlings and battens from Parrsboro to the United Kingdom last season totalled 18,186,656 superficial feet, valued at \$278,910. The corresponding shipments in 1912 amounted to 17,578,550 feet, valued at \$233,621. The exports of spruce and hemlock boards and scantlings to the United States amounted to 8,130,071 feet, valued at \$122,895. The figures in 1912 were 16,511,762 feet, valued at \$214,077. This big falling off was due in part to the slump in prices in the American market, and in part to the lack of water last spring, which left many logs in the woods. The laths exported this year numbered 5,043,800, with a valuation of \$11,269. The pieces of piling exported numbered 38,353, valued at \$69,871. The total valuation of the lumber shipped from Parrsboro last year was \$482,945. This, however, does not include the output of the Jeffers Manufacturing Company which consists of barrel shooks, dimension lumber and shingles. Nor does it cover all lumber shipments from Cumberland County, for about twenty million feet of deals went from Pugwash, on Northumberland Strait, to the British market, and large quantities were shipped by rail from the eastern part of the county.

The output of Hants County is placed at 42,500,000 feet. The shipments from Windsor, Hantsport and several other ports amounted to 29,000,000 feet. Shipments by rail totalled 7,500,000 feet, and included 3,000,000 feet shipped to Hudson Bay, via Halifax, while 6,000,000 feet will be held over.

Lumbering is an important industry in Queen's County, and Liverpool is one of the busiest ports of the province, but the only information available concerning last year's output is that it was "fully up to the average." Probably few remember what the average was, or is, but it should be large, for there are many operators in the county. One concern—the Davision Lumber Company—starts the

new year with seventeen camps, employs nine hundred men, and has 250 horses and oxen. The county also has a pulp and paper mills, which, like some others in the province, are said to be doing a prosperous business.

Large shipments are made from Annapolis and Digby Counties to South America and the West Indies as well as to the United States. Pictou County has four firms which cut about four millions each, and also has a number of smaller operators. Colchester County has a number of successful lumbermen, but the greater part of their output is shipped by rail. Nearly all the cut of Cape Breton is required at home in the mines and in the rapidly growing cities and towns. Halifax County ships the most lumber, but is not the largest producer.

Outlook For the Present Year

Prospects for the coming season are not considered very favorable, but there is always a chance that things may turn out better than expected. The home market is steadily increasing, and is likely to reach pretty large dimensions. It is quite possible that the opening of the Panama Canal may, in time, bring new competitors, but Nova Scotia will always have the advantage of her comparative nearness to the markets of the United Kingdom and the Eastern States. The demand for barrels for the shipment of apples and potatoes is increasing very rapidly, and this new branch of the lumber industry bids fair to assume large proportions, and will have the advantage of utilizing material unsuited for the manufacturer of merchantable lumber.

Lumbering, although by no means one of our largest industries, has always been of great importance to a large number of our people. It affords employment at a time when little or nothing is being done in some other lines of work, and it puts large sums of money in circulation at a time when it is much needed. It furnishes cargoes for our ships and freight for our railways, giving additional employment at every turn; and, best of all, the marvellous recuperative power of our forest heritage prevents any danger of it ever becoming a lost or exhausted industry, so long as reasonable care and judgment are used. Providence evidently intended that lumbering should be a permanent industry in this province, for a recent survey has demonstrated that fully two-thirds of its area are suitable only for timber growing, while the natural reproduction which usually follows lumbering operations practically makes our forest wealth a permanent asset.—Elihu Woodworth.

Hants County Lumber Shipments

Details of the shipments of lumber during 1913 from Hants County, N.S., not including stock cut along the I. C. R., shipped to Shubenacadie and Milford, etc., are as follows:—

Place of Shipment	Shipped	On hand
Windsor	10,000,000	2,000,000
Hantsport	3,000,000	1,000,000
Walton	3,000,000	2,000,000
Noel, Maitland, Selma, etc.	11,000,000	1,000,000
Total	27,000,000	6,000,000
Shipped by rail to United States..	1,500,000	
Railed to Halifax for shipment to U. S. and Great Britain and Hudson Bay	6,000,000	
Local consumption	4,000,000	
Total	38,500,000	
On Hand	6,000,000	
Total cut	42,500,000.	

Stocks are much lower than they were a year ago, being less than 50 per cent. of the former total. Good average export trade has prevailed with the United States, but most of our business is done locally. The prices we received during 1913 were the highest we have obtained. The outlook for 1914 is quite good. Thirty years ago Great Britain and the British West Indies took all our export. During 1913 we did not send them anything. Any offers we got for lumber or ground wood pulp were only at ruinous prices. The Dominion Government have removed Weymouth bar, opening a channel to accommodate ships of any size. One of the reasons why we do not ship to the English markets is that our harbor is open to all shipping the year around.—Campbell Lumber Company, Limited, Weymouth, N.S.

Nova Scotia's Trade Felt the Depression

A prominent lumber merchant of Halifax reviewing the market conditions of Nova Scotia during 1913, writes as follows:—Late last winter and early spring the market in the United States was inordinately high, or as it can be described, "away up in the air." The American commission merchants offered fabulous prices and the local people had to follow suit. The first thing that followed was the money stringency, and then the inevitable bad times, after which the New York market went to pieces, forcing prices away down. There was a clear drop at one time of from five to seven dollars a thousand in some cases. To make matters worse, small schooners, by which we generally ship lumber, were scarce, and freights high, all of which operated against us. Schooners found more profitable employment elsewhere, such as in fishing, etc. As a consequence the American market has remained depressed ever since and the outlook for next year is not any too encouraging. Prices for winter and early spring shipments will be at some considerable advance over those that prevailed during the past season. In the spring and summer the prices will probably decline again. Southern pitch-pine is selling on the American market today at less than the cost of production, and one of my firms writes me to say that he is surprised that spruce and hemlock have held up as well as they have.

Fortunately, to offset the conditions of the American market, the winter, spring and summer trade was good in England and prices were extremely high. Things were booming in the Old Country, but late last fall, owing to strikes, the tightness of the money market and bad times generally in the United Kingdom, spruce deals dropped one pound per standard, and the prices ruling at the present time are considerably lower than they have been for the past year. Lately there was one bad failure in the lumber trade of Liverpool. "Things look pretty tricky for 1914, with dangerous times ahead," was what one man wrote me. These exceptionally good times of recent years which Great Britain has enjoyed are causing a reaction in some quarters, and the lumber trade is feeling it. This reaction is sure to be felt in Canada under present conditions.

Hardwood in England is as low as it can be, in fact lower than spruce, which is almost at the lowest limit of the market.

For a number of years the annual timber cut has been in the vicinity of 500,000,000 feet, 400,000,000 feet for export trade and 100,000,000 feet for the home trade. This year it is estimated that the cut will only be about 450,000,000 feet, or a decrease of 50,000,000 feet on the cut of 1912. The causes of this decrease are many. Some have arisen during the year. The stringency in money has tended to curtail operations of some of our larger lumber firms. The lack of suitable timber lands, has reduced the output to some extent. And lastly, a number of small operators have gone out of business, either because they could not get the land or else were bought out by the larger firms.

The year 1913 has seen a good number of forest fires, and a large acreage of forest land destroyed. No accurate figures are at hand as to the number of acres burned, nor as to the value of the standing timber destroyed, but from general reports received, the losses have been heavy. Lunenburg County seems to have suffered most through forest fires, and perhaps the least affected was Pictou County. The amount of money expended by the various municipalities and the Provincial Government to prevent forest fires was \$9,000.

Nova Scotia Trade Review in Brief

Good prices prevailed in the English and United States markets for Nova Scotia lumber at the beginning of the year 1913, says an exchange. Ordinary spruce specifications for the United States sold at \$16 to \$18 f.o.b. vessel at shipping point. Hemlock scantling and boards brought \$14 to \$16. Laths were selling at \$3 per thousand. Spruce deals for England brought as high as \$18 per thousand feet f.o.b. steamer at Halifax. These prices continued fairly steadily until the month of June. In June and July the United States markets fell off rapidly until the price for spruce was from \$4 to \$5 lower. The demand for hemlock boards, however, continued and the price held at about \$14. The demand for lumber for local consumption in Nova Scotia was good throughout the year and quite a quantity was sent to Hudson Bay for construction work, some three million feet alone being shipped to that point from Hants County.

Prosperity Prevails at Bridgewater, N. S.

A special article dealing with the lumbering industry at Bridgewater, N.S., published in a recent issue of the Halifax Morning Chronicle, contained the following:—While money has been tight in the Upper Provinces, our lumbermen found no difficulty in obtaining all the money they wanted to operate their plants. It is safe to say that more lumber was moved this year than in any former year in the lumbering trade. Old stocks that had been piled up for some time were moved off, and turned into money, and everything pretty well cleaned up for the year 1914. Some difficulty was experienced at

the beginning of the season in securing the proper sized tonnage for removing stock, but eventually what was available was used, and the River LaHave was a busy hive of industry, and the loading wharves literally a sea of masts. The present low condition of stock is generally conceded as an omen of unsurpassed energy in lumbering circles.

The outlook for next year's business is good, prices promise to be higher, and they cannot afford to drop, on account of the increased cost of logging, manufacture and freight. The Davison Lumber Co. began the present season with seventeen camps, comprising nine hundred men, and two hundred and fifty horses and oxen. The lumbering industry in this part of Nova Scotia is flourishing. The demand for lumber shows no diminution, and the year 1914 promises to be very successful.

Nova Scotia's Unique Position

In taking a general view of the lumbering situation in Nova Scotia for the year 1913, there are several points to be noted and while they are not very prominent as yet still they can be taken as indicating the trend of conditions that are developing, writes J. B. Whitman, Deputy Crown Lands Commissioner for Nova Scotia, in the Halifax Chronicle. Lumbering has been one of the fixed staple industries of the province for some years but conditions have changed very materially and signs are not lacking that still further and important changes will occur. Within comparatively few years prices for about all grades have shown a very marked advance but operating expenses have fully kept pace with receipts in the rising scale. In all the industrial trades in Nova Scotia, except perhaps in the mining of coal, there is none that has been of more real and substantial benefit to the great majority of the people than lumbering. It has meant the distribution annually of about six million of dollars of money which was earned when many other industries were either slack or at a standstill. The story that 1913 tells us is that our forests are not to be treated as a matter of course but must be taken as a great national asset of marvellous and increasing economic value.

Nova Scotia has, during the past years, had a world-wide market for her lumber product without having any competitor enjoying the same shipping facilities. One of the results of such easy shipping facilities and world-wide markets has been the cutting and marketing of timber that was not mature for present profits looked better than future ones notwithstanding future ones might be very much larger. The present outlook for export lumber is not very encouraging as prices have declined and stocks are fairly plentiful both in the Old Country and the United States. The best feature of the whole situation is the increased demand with good prices for domestic consumption. There is a steady and growing market in this direction, a market and demand that is increasing year by year and it is up to Nova Scotians to see that their own forests are made to produce as much as possible of what is required for domestic use.

The Eastern Provinces of Canada have had practically a monopoly of the Atlantic markets, but there can be no question of doubt that the linking of the two great oceans is going to establish a new order of things. Eastern Canada lumbermen are going to realize in the very near future that they have a competitor for the sale of their product in the great markets of the Atlantic, a competitor that has immense sources to draw from, sources in comparison of which the forests of Nova Scotia sink into insignificance. Easy accessibility and unsurpassed shipping facilities render the position of Nova Scotia almost unique and it only remains for Nova Scotia timber owners to cease from trying to get as much land as possible, but to develop and cultivate reasonable areas for the time is here when timber areas require cultivation and care the same as any other crop and the year 1913 has contributed its lesson to teach us these facts.

Lumbering in Antigonish County, N.S., received quite an impetus recently on account of the arrival of the Colonial Lumber Company, a Boston concern of which the local manager at Antigonish is Walter F. Dixon. This company has bought a large number of lumber lots throughout Antigonish County. It has cleared up several of the rivers converging at or near the town and is erecting a large mill below the town of Antigonish. The company intend to devote special attention to the manufacture of hardwoods.

We are naturally optimists. Our view is that if the money stringency passes during the next three months and building operations are resumed in the United States, creating a normal demand, prices will be on a paying basis. Our volume of trade during 1913 was greater than during 1912. Profits were fully equal to those of the previous year and prices showed little alteration. Stocks are now smaller than a year ago. There has been a good demand for shingles and lath and prices have been good. The export trade to the United States was very bad after June. As stocks are now small we ought to get fair prices with a normal demand.—Clarke Bros., Limited, Bear River, N.S.

British Columbia Needs Curtailment

Reduction of Lumber Output During 1913 only 35 per cent. of Reduction in Consumption—
Per Capita Requirement Likely to Diminish in Future

THE annual meeting of the Mountain Lumber Manufacturers' Association was held at Nelson, B.C., on January 12th and was chiefly important on account of the very complete analysis of trade conditions contained in the annual reports of the president and secretary. The attendance at the meeting included the following:—W. A. Anstie, Forest Mills of British Columbia, Revelstoke, B.C.; George E. Quance, Quance Lumber Company, Nakusp, B.C.; H. H. Ross, Ross-Saskatoon Lumber Company, Waldo, B.C.; E. L. Staples, Otis Staples Lumber Company, Wycliffe, B.C.; J. P. McGoldrick, B. W. Sawyer, Walter F. Lammers, Adams River Lumber Company, Chase, B.C.; A. G. Lambert, A. G. Lambert Company, Nelson, B.C.; W. C. E. Koch, Koch's Siding, B.C.; J. S. Deschamps, Rossland, B.C.; G. R. Lawrence, Forest Mills of British Columbia, Revelstoke, B.C.; C. D. McNab, Baker Lumber Company, Waldo, B.C.; C. M. Pennock, Crow's Nest Pass Lumber Company, Wardner, B.C.; A. K. Leitch, East Kootenay Lumber Company, Jaffray, B.C.; W. Mark DeCew, Western Pine Lumber Company, Grand Forks, B.C.; O. I. Archibald, Kootenay Shingle Company, Salmo, B.C.; Fred C. Robinson, Western Canada Timber Company, Gerrard, B.C., and the Summit Lake Lumber Company, Summit Lake, B.C.; Charles O. Rodgers, Canyon City Lumber Company, Creston, B.C.; T. S. Richardson and A. E. Johnson, British-Canadian Lumber Corporation, Crescent Valley, B.C., and A. E. Frank, Secretary-Treasurer, Mountain Lumber Manufacturers' Association, Calgary, Alta.

The president, Mr. W. A. Anstie, in his annual address said:—It is not my intention to refer at any length to the work of your association since the last annual meeting, as I regard this as the special province of the secretary, who no doubt will deal with this question exhaustively. 1913 has proven possibly the worst of a succession of disappointingly unprofitable years for the lumber industry of the mountains, the principal causes for which are still fresh in our minds. Apart entirely from the fact that the world-wide financial conditions have been so stringent as to result in a tremendous check to the rapid development of western Canadian cities and towns, it has been forced upon the conviction of all observant lumbermen that the industry has been over-exploited to an unfortunate extent; so much so that it has been said with certain truth that the chief reason for the unsatisfactory state of the lumber trade of British Columbia is the over-producing capacity of our saw mills, which is out of all proportion to the existing market facilities. In this connection it will be of interest to consider the relation of producing capacity to the consumption of previous years; bearing in mind that we enjoy practically no tariff protection against American lumber and have been, and will continue to be, for years subject to the inroads of enormous quantities of low-grade lumber from the States of Washington, Oregon, Idaho and Montana, where over-production exists to even a worse extent than in British Columbia. The following table illustrates the condition very clearly:

Annual producing capacity mountain mills ...	1,000,000,000 ft.
Annual producing capacity coast mills ...	1,600,000,000 ft.
Annual producing capacity pine and spruce mills ...	600,000,000 ft.

Total annual producing capacity ... 3,200,000,000 ft.
During the year 1912 the consumption of lumber in the four western provinces of Canada, which constitute the present market for 95 per cent. of the production of the mills just mentioned was as follows:

1912 sales mountain mills (less than 50 per cent. of actual capacity ...)	488,000,000
1912 sales coast mills (less than 60 per cent. of actual capacity ...)	935,000,000
1912 sales pine and spruce mills ...	404,000,000
	1,827,000,000
1912 sales American mills in four western provinces of Canada ...	300,000,000

Total consumption of four western provinces ... 2,127,000,000

Trade Conditions Analyzed

It should be recalled here that the year 1912 provided the largest consumption of lumber ever experienced in western Canada, and the per capita consumption established what I believe to be the world's record. I mention this fact because signs are not wanting that our per capita consumption of lumber, which has been abnormally large, will decrease from this time on, and we shall sink to about the level of the western and middle-western States. The majority of our prairie cities and towns have been over-built, and for a few years at any rate will be

forced to go very slowly in the matter of future extensions. We shall witness a change from past conditions where we have been accustomed to seeing the largest proportion of our shipments going into city and town buildings, and will have to depend more on the country trade. The removal of the American tariff will bring us at once a small additional outlet for upper grades of lumber, but on the great bulk of our product we cannot hope for any market in the United States for some years to come. Looking into the immediate future it is difficult to see where we can hope for any marked improvement, or any prospect of placing our business upon a permanent plane of prosperity; but I do feel strongly, that upon the degree of judgment displayed by the manufacturers of this country in regulating production, will depend largely the amount of success that will attend their labors. It would be idle, of course, to lay all the blame for our unsatisfactory conditions at the door of over-production, but I emphasized this phase of the situation because I believe it admits of certain improvement if we exercise intelligence and co-operation in dealing with the problem. We are suffering from a combination of unfavorable circumstances in this business, which I should enumerate in the following order:

1st. Over-production of our plants.

2nd. Lack of tariff protection upon our product, while forced to pay for all machinery and supplies entering into the cost of our production, upon a high-tariff basis.

3rd. The excessive carrying charges and taxation our provincial government demands for the low-grade and thinly timbered licenses of the mountains.

The president referred briefly to the financial condition of the association affairs, and—while no large balance remains in the treasury—commended the conduct of this fund. He recommended that some action be taken regarding a grading inspection bureau, stating that it is most desirable to have such a department in connection with the association work.

Trade Returns For Three Years

Mr. A. E. Frank, acting secretary, presented his report, which contained the following interesting reference to operations during the last three years:

	1911	1912	1913
Manufactured			
Mountain mills ...	462,778,494	420,176,434	385,828,521
Coast mills ...	739,000,000	910,000,000	820,000,000
Pine mills ...	180,000,000	150,000,000	140,000,000
Spruce mills ...	192,000,000	198,000,000	170,000,000
Total manufactured ...	1,573,778,494	1,678,176,434	1,515,828,521
Shipments			
Mountain mills ...	430,719,292	488,659,304	335,794,326
Coast mills ...	708,000,000	935,000,000	800,000,000
Pine mills ...	120,000,000	200,000,000	200,000,000
Spruce mills ...	97,000,000	204,000,000	195,000,000
Total shipments ...	1,355,719,292	1,827,659,304	1,530,794,326
American importation into four western provinces ...			
... ..	264,413,000	300,000,000	133,146,000
Consumption ...	1,620,132,292	2,127,659,304	1,633,940,326
Stocks at end of year			
Mountain mills ...	255,000,000	188,000,000	216,941,531
Coast mills ...	225,000,000	200,000,000	225,000,000
Pine mills ...	150,000,000	100,000,000	75,000,000
Spruce mills ...	127,000,000	121,000,000	100,000,000
Total stocks end of year ...	757,000,000	609,000,000	616,941,531

In reviewing the result of operations for the year, the most striking fact is the enormous decline in the consumption of lumber in the four western provinces. During 1912 we find that the market consumed over two billion feet, whereas during 1913 the total consumption was one billion six hundred million feet, making a reduction of 463,000,000 feet. The production of lumber in the four western provinces has not at all declined in proportion to this decreased consumption. During 1912, mills manufactured 1,678,000,000 feet, and during 1913, 1,515,000,000 feet, making a net reduction of 162,347,000 feet. In other words, the curtailment in production has only been 35 per cent. of the lessened consumption. It is therefore clear that the only hope of better conditions in the lumber business is a substantial reduction in the output, which policy it is hoped will be generally followed by all manufacturers.

On referring to the figures showing the consumption of lumber in our market, we find that western Canadian mills have shipped about \$23,000,000 worth of lumber, of which mountain mills supplied

\$5,000,000—or 23 per cent. Adding to this amount the importations of lumber from the United States, we find that our market has consumed \$25,000,000 worth of lumber, or \$17 per capita population.

The Outlook For 1914 Trade

The outlook for this year has many encouraging features, but it is admitted that the bulk of trade will be confined to country points, rather than the larger centres of population; this by reason of the extensive programme now in preparation to attract bona-fide settlers, which is being carried on by three transcontinental railways of Canada. During 1913 there entered into western Canada 402,432 immigrants, as compared with 354,237 during 1912. I may say that during this year the Canadian Northern and the Grand Trunk Pacific will enter actively into this matter of settling along their respective lines, this campaign having been confined heretofore entirely to the Canadian Pacific. It is estimated that the figures of immigration this year should increase by about thirty per cent.

It is admitted that Canada—and particularly the western provinces—have developed abnormally during the past five years, and the time has come when retrenchment is the word of the hour. Curtailment of production is in vogue in all lines of business, and a similar policy will have to be followed by the lumber manufacturers, when, it is to be expected, business in general will settle down to a more normal advance—and should bring with it greater confidence and prosperity. The financial stringency has about come to a close, and the return to normal conditions in this respect is already noticeable. Loans are being made for building purposes, but it is not to be expected that large sums will be available for the development of speculative building in the larger cities. The inflated values established during the boom are a thing of the past, and bankers generally predict that an abundance of money will be available for industrial and other developments of the country.

The association has endeavored to be of the highest efficiency to all members, and in reviewing the year's work, I wish to call your attention to the order which was issued by the Board of Railway Commissioners for Canada early last year, allowing the application of your secretary for a 33 cent rate to northern points, where the mileages involved do not exceed those to Winnipeg. This order was strenuously contested by the Canadian Pacific Railway, and it was deemed advisable to compromise on a fair basis—which was done. I may say that this compromise effected a saving to the association of a large amount of expenditure in legal fees, etc., as well as bringing about the immediate publication of reduced rates, as contained in tariff W-2866. Reductions, thus obtained, while they do not represent any saving in money to ourselves (owing to reductions in delivered prices of lumber made) have opened up a much wider market for our product. The western freight rates case is being watched with interest, and the Golden rate case instituted by your secretary, has been made part of this rate inquiry. From the information which I have, I feel that a decision in this matter will be reached within the next two or three months and it is predicted that further substantial reductions will be made on all commodities.

The election of officers then took place with the following results:—President, Mr. Charles O. Rodgers, secretary-treasurer of the Canyon City Lumber Company, Creston, B.C.; vice-president, Mr. A. K. Leitch, managing director of the East Kootenay Lumber Company, Jaffray, B.C.; executive committee, W. F. Lammers, secretary-treasurer of the Adams River Lumber Company, Chase, B.C.; C. D. McNab, managing director Baker Lumber Company, Waldo, B.C.; W. M. DeCew, managing director, Western Pine Lumber Company, Grand Forks, B.C.; W. A. Anstie, managing director, Forest Mills of British Columbia, Revelstoke, B.C.; secretary-treasurer, A. E. Frank, former acting secretary.

A sales circular department was formed, with the view of distributing to all manufacturers promptly records of sales made. This is a department similar to that now being conducted by the Western Pine Manufacturers' Association of Spokane.

A motion was carried to move the head offices of the association to Nelson, B.C., at as early a date as possible.

A motion was also carried that the association establish a grading bureau at the head offices.

One of the features of the 12th annual convention of the Hardwood Manufacturers' Association which is to be held in Memphis, Tenn., on January 21-22 will be a discussion of logging and logging problems, considered from the standpoint of operations both in the hill country and in the lowlands. Results of practical experience as to methods and costs will be given, and an open discussion will follow. Excellent arrangements are being made for the success of the convention and a very large attendance is assured.

The seventeenth annual meeting of the National Hardwood Lumber Association will be held at Buffalo, N.Y., on June 18th and 19th.

Business Swinging Back to Normal

Editor Canada Lumberman:—

Vancouver, B.C., Jan. 9th.

The year 1913 opened up fairly well, and while we were at no time able to map out our way very far ahead, yet in the early months of the year a good volume of business was handled, though at no time did the prices obtained justify the transactions. The log supply in the early part of the year was light, and prices were very firm, ranging from one to two dollars higher than the prices prevailing in 1912. This worked a very great hardship on those mills which were solely dependent upon buying on the open market for their supply, and made it possible for mills operating their own logging camps to do business when the others could not. The year was ushered in amidst a blinding storm of optimism which prevailed pretty generally throughout the province, but in no place was it more noticeable than amongst the men who had logs to sell, or who expected to have. Plans were laid by them for the carrying out of a year's business quite unparalleled by anything in the history of the province, and some went so far as to predict a \$14 level for logs before the end of the season, and in consequence of these predictions many new operations were opened up, only to find the conditions altogether changed before their first boom was made up. With the mills it was different. We tried hard to appear optimistic, but it was of no use, there was a condition which must be met. We had gloomy forebodings of something that seemed to be in the air. We knew not what it was, but it was there, like Caesar's ghost, and we could not get away from it, and even at this date it is impossible to properly describe it. On the whole, my observations are that the lumber business in this province for the year 1913 has been very disappointing.

The year 1914 is stepping in very cautiously, and so far as logging and lumbering operations are concerned, indications are that it will tread lightly until a feeling of greater security prevails throughout the land. There seems to be nearly as much uncertainty existing at the beginning of this year as there was at the same time last year, but it is of a different kind. Last year it seemed as though some impending calamity was coming upon us, and we worked the whole year through under the disagreeable feeling which one experiences when it is believed that the worst is yet to come. With the opening of this year no one seems to have the temerity to predict anything worse than what we have already experienced, but rather the feeling seems to be that we have passed the worst, and are even now ascending the grade back to better times.

My own opinion is that while a certain amount of curtailment may be necessary, yet a reasonably good volume of business will be transacted in the last nine months of 1914, and I believe that, on the whole, the results of the year's business will prove quite satisfactory. I base this opinion upon several things, some of which I will mention. My information, so far as I have been able to gain anything of an authentic nature, is that stocks generally are light, or at any rate much below normal. Consumption has been light for the past year, owing to the prevailing feeling of uncertainty, and this does not apply alone to those consumers who were depending upon obtaining loans with which to carry out their projects, but also to the man with money. He wanted to see what was going to happen before going ahead with the contemplated building. The latter will now go on with his undertaking just as soon as the building season opens up, and this will give a stimulus to others, and pretty soon things will swing back to normal, or better, and we will be left to reflect upon the past year, and wonder how it all happened. Then, too, it is not unlikely that, during this temporary lull, many readjustments will be made in the methods employed which will prove beneficial, and help the wheels of progress to move more smoothly. Again, immigration has not ceased, but is still flowing in, and many of these newcomers have money, as was instanced at this port of entrance a few days ago, when a man and his wife with seven children were seeking to enter. The officer questioned him to see if he had the \$50 required by law, and the man pulled out his bank book written up for \$60,000. The officer could only remark "go on old man, you are the kind we want." These things considered, together with the fact, as shown by statistics, that the savings accounts throughout the Dominion were never in such a healthy state, can bring us to none other than the logical conclusion that this money is not going to lie still, but is going to join with the flow that is sure to come by the gradual loosening of the purse strings of outside capital for both public and private enterprises, many of which have already been entered upon. These remarks, while made directly upon the lumber situation, apply equally to the shingle industry, excepting perhaps, that the shingle business will be more especially benefitted by the readjustment of the tariff.

Having been actively engaged in the lumber and shingle business in British Columbia for the past twelve years, and associated in a responsible way in the manufacture and handling of twenty-five million feet of the former, and one hundred million pieces of the latter per year, I have had occasion to study conditions to some extent, and I offer the foregoing as my own private opinion of the situation as arrived at from general observations.—E. H. Newton,

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Wanted

500,000 feet 1-in., 1½-in. Soft Elm.
700,000 feet 1-in. Basswood, Ash and Birch.
For delivery as soon as dry this year. State what you can supply and lowest prices on cars.
Box 945, Canada Lumberman, Toronto. 3-8

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

Wanted to Buy

500,000 ft. log run, sawn Hard Maple, various thicknesses, M. C. out. Must grade proper percentage 1S and 2S and No. 1 Common and not to exceed 20 per cent. No. 2. Will pay cash when loaded on cars; or will buy good Maple logs in the round, 12-in. and up diameter.

Write P. O. Box No. 1595, Montreal, giving best price and rate of freight to Montreal.
2-t.f.

Hardwood Pickets Wanted

Beech, Birch and Hard Maple.

- 1 x 1 x 42.
- 1 x 1 x 48.
- 1 x 1½ x 42.
- 1 x 1½ x 48.
- 1 x 1¾ x 42.
- 1 x 1¾ x 48.

Require Thickness, 1/16-in. Plump.

Quality—Free from all defects.

Can take delivery of green or dry stock.

Apply to The Canada Wood Specialty Co., Ltd., Orillia, for full particulars, price, etc.
24-1 T.F.

Cargo Spruce Wanted

For New England delivery. We will pay cash for the following:—
4/4x5-in. and up rough-D-I-S, both merchantable and cull.

- 2x3-in. and up rough-D-I-S, both merchantable and cull.
- 2x4-in. and up rough random, both merchantable and cull.
- 2x6-in. and up rough random, both merchantable and cull.
- 2x8-in. and up rough random, both merchantable and cull.
- 2x10-in. and up rough random, both merchantable and cull.
- 3x4-in. and up rough random, both merchantable and cull.
- 4x4-in. and up rough random, both merchantable and cull.
- 6x6-in. and up rough random, both merchantable and cull.
- 6x8-in. and up rough random, both merchantable and cull.
- 8x8-in. and up rough random, both merchantable and cull.

State fully what you have to offer, and when you could commence and complete shipment.
Box 947, Canada Lumberman, Toronto. 3

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

For Sale-Lumber

Red Pine For Sale

Four carloads 2 x 4 and up; 18 ft. to 24 ft. P. O. Box 392, Ottawa, Ont. 3-t.f.

For Sale

One thousand cords dry softwood slabs and edgings. Canada Pine Lumber Company, Limited, Hamilton, Ont. 24-1-2-3

For Sale

6,000 round cedar fence posts, 7-in. top, 8 ft. long. Good and sound. Apply M. C. Neate. Rockcliffe Park, Ottawa, Ont. 8

For Sale

Spruce and Jack Pine, sawn to order, up to 12 x 12. Write for prices.
H. C. DUNBAR,
Haileybury, Ont. 2-3

For Sale

About 200 M. ft. of Hardwood logs from 9-in. to 13-in. in diameter. F.O.B. cars, Sherbrooke.
Apply E. L. DARCHÉ,
Ascot Corner, P.Q. 1-4

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.
GEO. C. GOODFELLOW,
Montreal, Que. c

\$15,000,000.00

We have about fifteen million dollars worth of timber lands for sale. Write us what you want. Dealers in timber lands, lumber yards, mill machinery, mills for sale, arranging loans, selling and exchanging cut-over lands, and a general real-estate business. If you want to buy or sell write us.

THE JANESVILLE EXCHANGE,
Timber Department,
Janesville, Wisconsin. 1-t.f.

Wanted-Machinery

Wanted

Double Seamless Edger. State make and price. G. A. Watson, Flesherton, Ont. 3

Wanted

Second-hand steam feed Cylinder. Must be at least 36 ft. long and 7-in. or 8-in. bore. Apply Box 932, Canada Lumberman, Toronto. 2-3

For Sale-Machinery

A Bargain

44-inch Wick Gang for sale at a bargain. In first class shape. Apply,
Fraser Lumber Company, Ltd.,
Plaster Rock, N.B. 2-7

Sawmill Machinery For Sale

1 3-block sawmill, cable feed; 1 "Canada Favorite" shingle machine; 2 shingle jointers; 3 shingle packers; 2 wood frame draw saws; 1 36-in. 3-saw edger; 2 combined lath machines and bolters; 2 power feed lath machines; 2 lath bolters.
c H. W. PETRIE, LTD., Toronto.

For Sale

1—Giddings & Lewis Horizontal Slab Re-saw.
1—Pair twin slabbers for ties.
1—Payette Box Board Edger.
1—Engine, 12 x 20, complete.
28—Wrought iron dry kiln trucks.
All in working order.

FIRSTBROOK BROS.,

Penetang, Ont.

24-1-2-3.

CORLISS ENGINES

150 to 175 h.p. cylinder, 18 x 36 in. stroke. This engine was new two years ago and was in actual operation less than one year. It is a Leonard's latest heavy design pattern, and is just as good as new. Would make an excellent Planing Mill engine. Can be bought at a bargain.

500 to 1000 h.p. Twin Vertical Steeple Compound Corliss Engine in first class running shape. Would make an excellent Saw Mill engine. A bargain for anyone who could use this engine.

500 h.p. Cross Compound Corliss Engine, direct connected to a 400 kw. 250 volt generator, complete, in excellent condition, with pumps and condenser. Can be bought at a bargain. Apply Thos. Hobbs, Mail Building, Toronto. 3

For Sale at a Bargain

1 10 in. x 10 in. Simplex Pump.
5 Steam Engines.
1 Killam Stock Gang (New).
1 Mitts & Merrill Hog, No. 20, 10 in. x 12 in.
1 Ricker with 30-in. Saw.
1 St. John Iron Works Driving Gear for Band Saw Carriage.
Edger, Planers, Shingle Machine, Chain Blocks, Trolleys, Saw Arbors, Pulleys, Rotary Saws, and a large lot of Steam and Mill Fittings.

Address, T. N. McGRATH,

Tusket, N.S.

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents.

Position wanted by thoroughly experienced Bandsaw Filer. Address H. J. c/o Canada Lumberman, Toronto. 2-3-4

Position wanted as single or double cut band sawyer for coming season. Good references. Box 940, Canada Lumberman, Toronto. 2-4

BAND SAW FILER, first class, wants position. Wide experience and thoroughly qualified for all kinds of filing or hammering in sawmill or woodworking factory. Satisfaction guaranteed. Sober. Best references. Address John Ackland, 253 Durand St., Sarnia, Ont. 3

A first class foreman carpenter desires to change his position. Specialist in transportable wooden buildings, such as hospitals, schools, cottages, bungalows, villas and farm houses. Have worked in the largest factory in Germany. Familiar with export trade to South America and Italy. Aged 39 years and energetic. Address Box 930, Canada Lumberman, Toronto. 3

Wanted-Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

Men for sawmill wanted: Engineer, fireman, sawyer, jacker, setters tail sawyer, lath contractor, pilers and others for Band Saw Mill at Kearney, Ont., for summer season. Cut is pine. State age, habits and firms previously employed with. Apply W. J. Armstrong, Biscotasing, Ont. 2-3-4

Salesman Wanted—Large Southern yellow pine manufacturers want a good Canadian salesman to travel Canada. Must know yellow pine trade. Good salary. Apply in first instance to E. J. Macintyre, 659 Peoples Gas Building, Chicago. 1-2-3

WANTED—An aggressive young man with some experience in the lumber business as City Salesman for a newly organized lumber company. Must be well recommended and desirous of getting results. Will have the option of becoming a stockholder in the company. When writing state age, experience and salary expected. Address J. P. Bertrand, Port Arthur, Ont. 8

WANTED—Retail Yard Foreman in a newly organized company at Port Arthur, Ont. One who is prepared to subscribe a certain amount of stock preferred. Must be sober and capable of showing results. In writing enclose references, state about what amount stock you could subscribe, and salary expected. Address Box 951, Canada Lumberman, Toronto. 3

WE WANT TRAVELLING SALESMEN to carry our lists on commission for the following sections: Western, Central and Eastern Ontario, New York and New England States. We carry large assortments of Spruce, Hemlock, Pine, Lath, Shingles, Yellow Pine timbers and planing, Fir, American Hardwoods, etc. State experience and connections and give reference. Apply Box 950, Canada Lumberman, Toronto. 3

Business Chances

For Sale

Timber limit consisting of 10,000,000 feet of Pine, Spruce, Hemlock and Hardwood, tributary to Lake Nipissing. Also sawmill and logging outfit, boom timber and chains. Good reason for selling. For particulars address Box 846, Canada Lumberman, Toronto. 19-t.f.

Wanted to Buy

One or two lumber yards each doing a yearly business around \$30,000. Would like to trade some farms in on the deal. Apply to K. T., c/o Canada Lumberman, Toronto. 24-1-2-3

Saw Mill For Sale

Practically new. Fully equipped. Capacity 18 to 20 M. ft. daily. Engine 60 h.p., boiler 68 h.p. Everything modern. In perfect running order. Suitable for heavy timber. Will sell on ground or F.O.B. cars. Further information from Box 949, Canada Lumberman, Toronto. 3-4

For Sale

Fir and Spruce Timber Limits in the vicinity of Fort George. Price right and terms liberal. Will be sold in quantities as agreed upon up to 45 square miles. Timber not excellent in British Columbia.

If interested apply for further information to
D. J. McEACHERN,
Alvinston, Ont. 3-6

Retail Lumber and Planing Mill For Sale

Situated in best thriving town in Ontario, served by three railways, average of two hundred houses built yearly. Business averages over \$35,000 yearly. Would consider selling machinery and rent buildings and real estate for a term of years. For further particulars apply to

HAROLD L. KEARNS.

3-4 Orillia, Ont.

Saw Mill For Sale or Lease

What is known as the "Island Mill" at Little Current. Cutting capacity 140 M. inch lumber in 10 hours. In first class condition.

Possession can be given 1st January next. For further particulars apply to

THOMAS CONLON,

44 Church Street,
St. Catharines, Ont.

21-t.f.

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf

For Sale

Rare bargain. Band mill located in best lumber and log center on Puget Sound. Rail and cargo shipping facilities. Excellent log pond. Ten and a half acres of land. Price one-fourth of appraised valuation. Must sell quick. Box 765, Canada Lumberman, Toronto, Ont. 8-t.f.

For Sale

Lumber Limits in Eastern Canada, 50,000 acres, large Sawmill, fully equipped going concern, on salt water. Correspondence solicited. Will be sold right to close estate.

Address, Timber Limits, care Canada Lumberman, Toronto. 22-t.f.

Fine Timber Tracts

We have a number of timber tracts for sale in most all states at low prices and reasonable terms. Have few bargain tracts that are offered for quick sale. Write us what you want, we have it.

THE JANESVILLE EXCHANGE, Timber Dept., Janesville, Wis. Dealers in timber lands, lumber yards, mill machinery, mills for sale, arranging loans, selling and exchanging cut-over lands, and a general real-estate business. 1-t.f.

Saw Mill Property For Sale or Rent

The following are some of its leading features: Situated near Little Current, on the Georgian Bay, on what is known as Picnic Island. Contains 37 acres of freehold property which includes the mill and more than twenty other buildings. It has been leased by the Wolverine Lumber Company during the past seven years, and their lease expires the first of January next. If they buy more limits they may likely continue the lease. In the meantime we are offering the property for sale or rent. The mill has been cutting about 20,000,000 a year on small logs and a ten-hour day. The Island is in unorganized territory and our yearly tax on it is only one cent an acre in addition to the Little Current school tax of about twenty-five dollars a year. The power consists of two engines—a 24 x 30-inch and a 20 x 20-inch cylinder. Five boilers 60-inch diameter by 16 feet long. A double cutting band, a wickes gang (36-inch) and a circular saw. Two trimmers, two edgers and good lath mill capacity. The protection against fire is probably the best on the Georgian Bay; with a fine large pump in the machine shop, and a water tank outside ninety feet high with water pipes leading to the mill and all the houses on the Island, four streams at once can be thrown on the mill. We carry \$62,000 insurance on the mill and on all the buildings, the average rate being less than four per cent. Our piling capacity consists of 2,200 feet of stone-filled docks holding about ten million feet, and ten million more in the rear on the ground. Vessels can load at the docks to sixteen-foot drafts and be well sheltered. First-class booming room for about 15,000,000 feet of logs, 650 booms and chains. We carry boiler insurance, and the inspectors' report this year testifies that everything is in good condition. The average loss of time during the past six years is probably less than three days in the season for repairs, and the quality of the manufacture is among the very best on the Georgian Bay. To build up this property at the present time would cost at the least \$200,000, but we do not care to go back to the active work of running it, and will sell the property free of encumbrance for \$75,000 and on easy terms of payment. There is now a railroad running into Little Current which will materially increase the value of this property. If we do not sell soon, would lease it for a term of years at a reasonable rent, and will be pleased to correspond with interested parties. For further particulars apply to the undersigned.

Thos. Conlon,

44 Church Street,
St. Catharines, Ont.

24-1-2-3

Miscellaneous**For Sale**

Tugboat, 65 ft. over all, 14 ft. 3 in. beam, 8 ft. deep, fully equipped with winches, 10 and 20-in. compound engines, surface condensers and pumps. All connections and pipes brass and copper. Address T. N. McGrath, Tusket, N.S. 20-t.f.

Tenders for Cedar Poles

Tenders will be received by the Suburban Construction Company, c/o G. C. Royce, 90 Sherbourne Street, Toronto, for the supplying of approximately:

2,300 45-ft., 8-in. top, Cedar Poles.
350 35-ft., 7-in. top, Cedar Poles.
100 60-ft., 8-in. top, Cedar Poles.

Tenderers will furnish particulars of the quality of the poles and point of inspection. 2-3

Saw Mill Machinery For Sale

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterville Engine Works Company,
22-t.f. Brantford, Canada.

**MAIL CONTRACT**

Sealed tenders, addressed to the Postmaster General, will be received at Ottawa until noon, on Friday, the 6th of March, 1914, for the conveyance of His Majesty's Mails, on a proposed contract for four years, six times per week each way, over Streetsville (via Meadowvale and Churchville) Rural Mail Route, from the Postmaster General's pleasure.

Printed notices containing further information as to conditions of proposed Contract may be seen and blank forms of Tender may be obtained at the Post Offices of Streetsville, Meadowvale, Churchville, and at the office of the Post Office Inspector, Toronto.

A. SUTHERLAND,

Post Office Inspector.

Post Office Inspector's Office.

Toronto, January 19th, 1914.

Brooms or Fans.

All woodworking machine: make refuse of some sort or another. Some more, some less; some shavings, some chips, some dust. So far, we all agree. Perhaps I am also safe in saying it is never wanted just where it is made. It has perforce to be removed somewhere—some time—somehow.

Now what is the best and cheapest way, eh? Oh, put in a fan and some piping, and there you are. Many, very many, have decided as above, and fondly fancied their troubles were over, only to find out they had bit off much more than they could chew. Some of you have been bit with the fan dog, and know why. Others, again, are wondering just what is the matter with their fan and pipes.

Firstly, it must be remembered that the dust-collecting business is skilled work. Any fool can buy a fan and run a few pipes; but it requires expert knowledge to know just what size, make and speed of fan that is wanted, also where to put it; how to lay out pipes to save awkward bends and corners, so as to obtain desired results. It is not a plumber's job, by a long way. Then perhaps by far the greatest stumbling block to the unwary is what power is

required. Yes, that's the word—power. It is the all-important item. Yet how many have installed blowers and never gave it a thought. It is the old story; put a pulley on the main shaft; it will not want much power to run a fan. Quite right; perhaps it does not require a lot of power to drive a fan, but it takes an enormous amount of power to drive a fan fast enough to do any good. It is a well-known fact that most sawmills are badly under-powered, yet they put in fans here and there, as though they were mere tops instead of power-hogs. It has been found and proved by bitter experiences, both here and abroad, that a dust-collecting system in a wood-working factory will consume from 25 per cent. to 33 per cent. of the total power required to run the plant. Say you have an average saw and planing mill that requires 100 h.p. to run it. Before you could install a proper, efficient dust-collecting plant you would require to find about 30 h.p. to work it. How many have so much power to spare—very, very few. That, to my mind, is the great drawback to fans—the want of power. So we have still to rely largely on brooms and shovels until some genius invents a good low-speed fan that does not require much power to drive, yet creates a suction strong enough to pull the limewash off the wall's.

The Uses of Beech

Woods which are free from objectionable taste find place in the manufacture of commodities which come in contact with food-stuffs, and beech has long been one of the chief woods so employed. Lard tubs, butter boxes and pails, and the beaters for ice cream freezers are other commodities for which beech serves admirably. For ice cream beaters the persistent hardness of the wood when subjected to attrition and abrasion while wet gives it peculiar fitness. Sugar hogs-heads are made of beech, partly because it is a tasteless wood and partly because it has great strength. It is an excellent ma-

terial for churns. A large class of woodenware, including veneer plates, dishes, boxes, paddles, scoops, spoons, and beaters, belongs to the kitchen and pantry, and beech is one of the common woods of which they are made. Beech picnic plates are made by millions, a single machine turning out 75,000 a day.

The wood has a long list of miscellaneous uses and enters into a great variety of commodities. In every region where it grows in commercial quantities it is made into boxes, baskets and crating. Beech baskets are chiefly employed in shipping fruit, berries and vegetables, and are of thin lumber, generally veneer, and intended to be used only once. In Maine thin veneer of beech is made specially for the Sicily orange and lemon trade. This is shipped in bulk and the boxes are made abroad.

Beech is an important handle wood, though not in the same class with hickory. It is not selected because of toughness and resiliency, as hickory is, and generally goes into plane, handsaw, pail, chisel, bundle and flatiron handles. Recent statistics show that in the production of slack cooperage staves, only two woods, red gum and pine, stood above beech in quantity, while for heading, pine alone exceeded it.

Review of Current Trade Conditions

Ontario

Trade conditions in Ontario have been very slow since the New Year. This does not mean that they are more than ordinarily quiet, but that various factors which come into play at this time of year have been having their customary effect. There has been little or no movement out of retail yards during January, and as a result, retailers are not buying stocks. Stocktaking, holidays and unseasonable weather have been the chief causes of this situation. Wholesalers, realizing that trade is practically at a standstill, have taken their men off the road in many cases, and are devoting their attention to looking over available stocks for purchases. A prominent Toronto wholesaler recently visited one of his good customers, with a view to selling him some stock, and found himself seventh in a line of wholesalers seeking to sell. He went back to his office, and meeting the representative of the Canada Lumberman, suggested that, if wholesalers would take their salesmen off the road at present and let the retailers have a little rest cure, the result would be a fair improvement in trade conditions.

Hemlock shows no change and prices are still maintained at former levels. Yellow pine seems to be a little firmer and manufacturers in the south report a slight improvement in the market. Lath are practically out of the market today. British Columbia shingles have not changed. New Brunswick shingles are very strong. A prominent New Brunswick manufacturer recently reported that a number of mills which will have an output of about 70,000,000 pieces during the year 1914 have already contracted for the sale of 50,000,000 pieces.

Eastern Canada

There has been little or no change in trade conditions at St. John during the past fortnight. Excellent conditions are reported from the woods all over the province. St. John mills are all closed. A St. John firm has sold 2,000,000 deals to English buyers at \$17 per thousand, on a specification of 50 per cent. 7-in. and 8-in. x 3-in., balance 9-in. and 11 x 3 in. This is the first sale of 1914 stock reported. St. John stocks of merchantable spruce boards, also refuse boards, scantlings, planks and deals are almost exhausted. Manufacturers are expecting about one dollar more per thousand for merchantable and refuse lumber this year.

The market for eastern spruce at Boston showed some improvement. Retailers have finished their stocktaking and, as a result, there are some fairly large contracts in sight. Frames are selling at a base price of \$24.50. Random is quiet, 2 x 4 in. selling at \$22; 2 x 3 in. at \$21; 2 x 5 in.; 2 x 6 in. and 2 x 7 in. at \$20; 2 x 8 in. at \$22.50; 2 x 10 in. at \$24 and 2 x 12 in. at \$24.50. Spruce covering boards, 5 in. and up are offering at \$22 and matched spruce, 12, 14 and 16 ft. at \$24.50. Prices for eastern spruce at New York are unchanged, but there is a slight upward tendency. Yard stocks of hemlock in retailers' hands at New York are reported low. The trade is of a hand-to-mouth character. A little better buying of hardwoods is reported from New York, but no extensive movement is noticeable. Plain and quartered oak are in good demand. The greatest activity is in the market for birch and maple. At Boston, retailers are holding back with their orders for hardwoods, and business is dull.

United States

A cheerful business spirit has commenced to make itself evident in the United States, in spite of the fact that reports, as yet, do not show that actual trade conditions have materially improved. There is a general feeling that the trade pendulum has commenced to swing in the right direction and the belief is prevalent that conditions will be considerably better in the near future. No one is looking for a boom, but nearly everyone is expecting improvement. Taking the yellow pine trade as an indication, it is interesting to note that mill representatives and wholesalers report a greater volume of actual orders during the past fortnight than in any single period in the year 1913. Yellow pine prices, however, have not advanced. An important feature of the trade has been the fact that a steady growth in building construction took place during the month of December. Stocks in the hands of retail and large consumers, in practically all parts of the country, are very low and they will find it necessary to come into the market for material quite extensively in the near future. The chief adverse feature of the trade is the fact that prices continue low, but this is likely to be improved as soon as the demand continues to be really active.

In the northern States, logging conditions had not been good up to the middle of January, but cold weather and more plentiful snow, which were then in prospect, promised to relieve the logging

situation greatly. At latest reports, zero weather was quite general and logging conditions had improved. White and Norway pine, hemlock and cedar have all been quiet, as is usual at this time of year. Manufacturers, after completing their inventories, report that the average of trade throughout the year was fairly satisfactory and that there was no important surplus of stock in any part of the country. Retail supplies are so light that a good spring trade would clean them up entirely. A better price is reported for hemlock, which is scarce and is expected to advance. The trade in general at Buffalo is quiet, with prices steady.

Hardwood consumers have only light stocks and a tendency is noticeable to resume buying, wherever prices are suitable. Most of the mills in the important manufacturing districts have sufficient orders ahead to keep them busy for some time.

There is a better demand for eastern spruce; but the price has not improved. Many of the eastern retailers are now replenishing their stocks.

Great Britain

Reports from London indicates that business is commencing to move again in the Metropolitan area. A certain amount of forward business is being arranged. Nothing of importance is reported in connection with prices. It is expected that freights will rule through the coming season at easier rates than last year, but there is no likelihood that the cost of goods will be lower than the average of 1913. Prices in general show little variation and the demand appears quite hopeful. Deliveries at London docks for the week ending January 3rd amounted to 5,848 standards as compared with 4,834 standards during the corresponding week of 1913. At Foy, Morgan & Company's recent auction sale prices showed little variation. Quebec spruce, 3 x 9 in. 3rd sold at £11 14s, and 3 x 7 in. 2nd Quebec spruce brought £10 10s. A lot of dry 3rd Quebec pine, 3 x 7 in., 10 to 16 ft., was sold at £15 15s per standard hundred.

At Liverpool, trade is commencing to take on a more active appearance. Travellers are on the road again and business is resuming its normal course. No change is reported in spruce deals, on c.i.f. business, which is confined to liner parcels. Very little business is being done ahead. Consignment parcels have been realizing fair prices. There is no immediate sign of a further decline in values. Arrivals by liner parcels have not been large. A report from Liverpool states that if there were no spruce arrivals from now until the commencement of the season, probably it would require a much better demand than is in prospect to bring about an advance in prices. There is practically four months' supply on hand at present. The spot market is rather at a standstill, the demand being only for active requirements. Very little business is being done on birch c.i.f. terms. A small amount of business is reported in Quebec pine deals and boards, but not enough to make any effects on stocks, which are held firmly by chief importers. At Manchester, it is reported that prices for spruce are "wobbly."

Will Operate Nepisiguit Mill

The Bathurst Lumber Company, Limited, Bathurst Village, N.B., are fitting out the Nepisiguit Lumber Company's mill which has been idle during the past two years, and which they purchased some time ago. They will operate the mill during 1914 as a saw and shingle mill. They are putting in shingle machines on one side and a band saw and a band re-saw on the other side and expect to have it in operation by the first of May. This, of course, will be an entirely separate operation from their present sawmill at Bathurst Village and will increase the company's output considerably from that point.

Fassett Company's New Plant in Operation

The new mill of the Fassett Lumber Company, at Fassett, P.Q., commenced operations on January 5th. Full night and day shifts were put on on January 19th. The company will run night and day throughout 1914. The main building of the plant is 186 ft. x 55 ft. and there are two wings 40 ft. x 60 ft. and 42 ft. x 138 ft. The plant is much larger than the one which the company formerly operated and which was recently destroyed by fire. The equipment includes two 8 ft. single cutting bands, two edgers, 5 slashers, automatic trimmers, etc., all installed by Clarke Bros. & Company, Olean, N.Y. The power plant consists of a 600 h.p. Corliss, 6 valve engine. A fire pump and dynamo are also installed in connection with the engine house. The mill has a solid concrete floor and foundations. It will cut 100,000 feet of soft-wood in ten hours.

Market Correspondence

SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD

First Sale of St. John English Deals for the Year

St. John, N.B., January 23rd; (Special to the Canada Lumberman).—The last two weeks have seen very little, if any, change in conditions in this section. The winter is all that can be desired for lumbering, clear cold weather, thermometer standing around zero about all the time, with from six inches of snow in St. John County, to two feet or better in the interior of the province. The cutting and hauling of logs is progressing as well as can be expected, and if we have a good winter for balance of season, all logs should be hauled off yards without any trouble. Men for woods work still remain very scarce. All the mills in St. John are now idle and will remain so until the latter part of March. Locally, the lumber market remains about the same as at last writing, very little selling for 1914 has yet been done. It is said that one local concern has sold its first two million of deals to English buyers here for \$17 per M., 50 per cent. 7 and 8 in. by 3 in., balance 9 and 11 in. by 3 in., with the 3 x 4 - 5 - 6 in. at about \$1.50 per M. reduction with fourth quality about \$15 and ends around \$12, the average length being about 13 ft. 6 in. No other sales of English deals have yet been made. No laths have been sold ahead for 1914, in fact this is the only sale that has yet been made at St. John. Local stocks of merchantable spruce boards, also refuse boards, scantlings, planks and deals are about exhausted.

It is felt that prices of both merchantable and refuse lumber will be around \$1 per M. higher in 1914 than in 1913. This will no more than take up the increased cost of logging this winter. All fixed charges are increasing fast. Of course this advance in price will be regulated, not by the operator, but by the supply and demand. The supply will not be over plenty, and the price of logs will be higher. No sales of American stock have yet been made, but it is felt that there will be an improvement of at least \$1.50 per M. in American prices. Laths are being held for \$3.25 per M. on the wharves here. Box shooks and fish boxes of all kinds are in good demand, with prices hardening. Shingles still remain in the same position as they have been of late and do not seem to improve any.

Montreal Trade Continues Quiet

Montreal, January 27th (Special to the Canada Lumberman): As usual at this time of the year, business in lumber is dull. Some firms report an improvement over the corresponding period of 1913, while others state that the market is dead. The trade, however, is anticipating an excellent year. In 1913, the houses built were far short of requirements, and to meet the growing population, hundreds of flats and houses are needed. The demand is urgent, and will have to be filled. This indicates good orders for the lumber trade. Some extensive building schemes are also projected, and will be carried out, always provided that money becomes easier. Prices still keep firm, the tendency being towards a higher range. Several inquiries for birch for export to Great Britain have come to hand. Last year there was a decrease of birch shipments from the port.

In the pulp and paper sections there is a more buoyant feeling, in view of the fact that the banks are more inclined to give accommodation. Ground wood is better, as stocks are decreasing but there is a large tonnage yet to be disposed of, and until this is done there will not be a strong recovery.

Chemical pulp is firmer. One of the large mills has sold 90 per cent of its production, and has declined further contracts.

Hemlock prices during 1913 were \$1.50 higher and spruce \$2 higher than during 1912. The export trade to Great Britain was slow during the summer of 1913. The outlook for spruce and hemlock is good, as there seems to be a continual demand for stock sizes and stocks at the mills are small. We think that the market for pine and hardwood will be somewhat slower than last year.—Fassett Lumber Company, Fassett, P.Q.

The farmers here, as well as on the prairies, have realized good prices and have had fair crops during 1913. They are practically out of debt. Their credit is good for another year and this, together with the building of the C. N. R. as announced by Sir Donald Mann, ought to make the lumber business good during 1914. We found the volume of trade less by about half during 1913, as compared with 1912 and the profits were about the same, in comparison with the amount of business done.—Johnston and Carswell, Vernon, B.C.

The Uncertain Period Has Been Passed

Editor Canada Lumberman:

Boston, Jan. 9th.

The lumber trade seems to be more or less affected by the general rather depressed condition of business throughout the country, and in fact, I might say throughout the world.

The lumber business is apt to be rather slow to respond to either an improvement or a decline in trade, but it always seems to conform finally to the general existing conditions. Generally, in the past, when the lumber trade has been poor in one section of the country, or in one line of the business, it has been fairly good in some others. For instance, when the South American business was poor, the European, or English trade would be brisk, or when the New York business was very good the general business throughout New England was not as good. It is seldom that all portions of the lumber business are active at one time, and it is seldom that all are depressed at one time. We think, however, today, these conditions are rather different.

The South American market for lumber is very much depressed. There have been a number of failures in the Argentine Republic. Last year's crops there were not very satisfactory and prices have been declining, until, of late, shipments there have come pretty nearly to a standstill, and although there are a number of vessels on the market offering for South America they do not find takers.

Also, for the past few months the English market for American deals and other general sizes of lumber has been very quiet, and it has not yet improved much, although there seems to be a feeling in the trade that the English market will probably respond a little later and show improved conditions.

In the past month or two the general New England market, as well as the New York market, has been very quiet, and for the past three or four weeks many of the men in the yard trade have had hard work to keep their teams moving and many have discharged men and horses. However, we might say, this is not peculiar to the present year, as this is about the quietest season of the year in the lumber business, but altogether conditions are rather markedly dull at the present time.

Labor is now plentiful and we think there are a good many unemployed laborers,—a good many more than there were at this time last year. We find in our logging operations that men are plentiful in the woods and do not leave their jobs as they have for the past few years, feeling they might get something better or some more pay. Now they all stay and when we do happen to have a vacancy we can fill it at a reduced price.

Conditions seem to be fairly good for logging this year so far, and we judge that, if we get snow later, which is likely, there will be a pretty good average cut. However, the cost of logging is quite high still and it is exceedingly difficult to make sales showing a reasonable profit over the present cost of production.

Now, while we feel these conditions cannot prevail very long, we do not think the concessions are coming all from either side of the market. We believe that lumber will be produced a little cheaper this coming year than it was last year, the present stagnation will not last many months, and that prices will improve. Money conditions now show signs of easing up, as they generally do at this time of the year. We cannot help feeling, that the money tightness may ease up materially and reflect the present conditions. So we hope we have reached the lowest point for the present in the lumber market, and that improvements will begin to show themselves within four to six weeks. There is, however, no encouragement for buying at present, and we believe the sales, both for English consumption and the home market, have been very small, and would advise holding off at the present time. However, a large portion of the lumber manufactured is held by pretty strong operators.

Of course, it is early yet to say what the effect of the new legislation will be on the market, but as far as we can see, the feeling is one of relief, that the uncertain period is now passed and that we can very likely do fairly well with the laws as they now are, governing the currency and the tariff. We believe that during the next year things will largely adjust themselves to the present conditions. Whereas, in the past two or three months, business has been retarded considerably by the feeling of uncertainty in trade under the new conditions, we believe, now that the surgical operation has been performed, the patient will commence to recover. All things considered, we think perhaps the boiling down process will be found to have been very salutary.—H. B. Shepard.

SATISFACTION FOR SALE

OUR Lumber is manufactured with a Purpose. From the Stump to the Finished Product this Purpose is never forgotten. We aim to make our Products and Satisfaction synonymous. We want every car we ship to be filled not only with Lumber but with Satisfaction.

We are equipped to give you uniform grades—dry stock—fine planing mill work—good service and courteous treatment.

When buying of us, your worry, your anxiety, is over with the placing of the order. You know you will get what you want—in the way you want it—that upon arrival, you will be pleased. It will make your business a source of pleasure and happiness.

	£26,198,854	£23,591,810	£24,306,059

Foy, Morgan & Company, London, Eng., in their annual wood report say:—

The importation of sawn and planed wood goods into the United Kingdom during 1913 has been very large, the largest in quantity since 1906, while in total value it has broken the record by several millions sterling. Compared with the average of the previous five years, the increase in the supply represents about 280,000 standards, or an excess of 16 per cent. in quantity and nearly 30 per cent. in value. This result has been brought about by the most familiar of all causes—the anxiety of everybody to participate to the utmost in the advancing trade boom. The import has been thus augmented, partly because the depleted condition of stocks at the outset furnished every inducement, if not the necessity, for a certain freedom in buying, a policy which was afterwards sustained by the optimism prevailing throughout the summer, while the keen desire to take full advantage of shipping opportunities during the time they lasted was no less natural, if only by way of reaction from the baneful experience of the previous year in respect of chartering. The possibility of this unwelcome surplus was, however, not suspected until the autumn was well advanced, and the fact that the production of Russian and Baltic goods had so greatly increased, occasioned considerable surprise. During the previous six years a policy of caution had held the supplies in severe restraint, but under the influence of a general trade boom the import has gone forward again with a bound, rivalling in quantity the more ample supplies customary in the decade ending with 1906, but far outstripping them as regards cost. The pendulum has in fact swung back again, and full stocks are held where formerly the barest quantities sufficed.

The average import cost per standard continues to rise year by year, the influence of high freights being especially marked during 1912-13, as the following figures show:—

1913—£10 9 3	1910—£9 9 3	1907—£9 11 0
1912—£9 18 3	1909—£9 0 3	1906—£9 4 9
1911—£9 9 0	1908—£8 16 6	1905—£8 10 0

Practically the whole of the surplus is accounted for by the increased shipments from Russia, which is responsible for 63 per cent., or about 165,000

standards, and from Sweden, which has contributed 17 per cent., or about 45,000 standards, the other sources of supply keeping in the aggregate fairly close to the average. The relative proportions derived from the different exporting countries over a series of years are stated in the following table, which exhibits the progress made by Russian goods in ousting other varieties:—

	1913	1911	1909	1907	1905	1903
Russian goods	51%	47%	46%	37%	35%	29%
Scandinavian goods	25	25	25	32	34	33
Canada and U. S. A.	22	26	27	28	28	33

The result of the past year's trading, although somewhat impaired during the last three months by the losses attendant upon the effort to unload while stocks have been accumulating, must yet have been more than usually satisfactory when compared with the series of lean and sometimes unprofitable years which have preceded. Business on the whole has been sound, while the turnover has increased considerably in quantity and still more so in money value, so that despite dear money, high freights, the malign influence of the Balkan War and other obstacles, it is safe to say that traders must have been making money—at least for the first nine months of the year. Throughout this period there were no surprises, no unknown and incalculable factors to defeat expectations or play havoc with the often too narrow margin of profit which separates the re-sale from the cost price. Except for a short time during March and April, few doubts as to the stability of the market were entertained, so that the whole circle of business operations kept moving quietly onwards for nearly nine months, high prices being accepted as the established order of things by the trade at large, including the consumers. While these conditions lasted, business was fairly profitable, and it was therefore with somewhat of a shock that the trade awoke to the discovery early in October that the security into which they had been lulled had been silently undermined by the mere accumulation of good things. The progress of events in 1913 has proved to be the very antithesis of what happened in 1912. In the year that has passed nine months of good trading have been succeeded by three months of unprofitable business, whereas in 1912 the first nine months were indifferent, if not bad, from a trader's point of view, and the last three months exceptionally favourable. October has often before proved itself a critical period; it marked the commencement and may be destined to mark the termination of the present boom. On the other hand it must be remembered that the prospects of an increase in consumption in the near future are particularly hopeful in view of the predicted revival of house and cottage building. If these anticipations are realised to any extent before next summer, the surplus of stock may be easily absorbed.

The comparative freedom from bad debts during the past year may be regarded as another sign of the profitable character of the trading, which has, moreover, been enjoyed in equal degree by all classes—shippers, importers and dealers, so that the retrospect may be said, with less qualification than usual, to be a favourable one.

Regarding the trade in Canadian goods the report says:—Pine.—Trade has been quiet, but a profitable business was done until the end of August. During the last few months complaints have been rife as to the paucity of orders, but as the stock is held in few hands, there is no likelihood of prices receding, especially in view of the high cost of future supplies. The prices c.i.f. opened at £40 10s., £28 5s., £17 15s. and £12 10s. for 3 x 11, £30 5s., £22, £14 5s. and £11 for 3 x 7 to 10-inch 1st, 2nds, 3rds and 4ths, respectively. The market for pine sidings has been a weak one throughout the season.

Spruce.—Prices for Quebec deals opened at £11 10s. for 3 x 9 and £10 for 7 and 8-inch 3rds, c.i.f. liner ports. For several weeks business was rendered impossible to the outports in consequence of the extravagant freights de-

Dick's Original Balata Belting

The only Balata
Belt used by a
Canadian Manufac-
turer producing nearly
100,000,000
ft. of lumber annually

Dick's Balata Belt has proved its worth in many of Canada's greatest mills. Its great strength and durability together with its strong gripping power and the fact that it is absolutely impervious to water and steam admirably adapts Dick's Balata Belting to give the greatest economical service under the most trying conditions.

Forty years of experience and unquestionably the highest grade materials are the secret of the enormous success of Dick's Balata Belt.

Give us full specifications of your drive and we will specify the proper Dick's Balata Belt, which will give you better satisfaction than any belt you have ever used.

Skefko Ball Bearings

The only bearing which will withstand a considerable axial thrust without loss of efficiency and will accommodate itself to all deflections of the shaft.

The Canadian Fairbanks-Morse Co., Limited

Canada's Departmental House for Mechanical Goods

manded for tramp steamers. Towards the latter part of February Lower Port spruce was however pressed for sale at reduced prices, in the belief that a heavy fall in freights was imminent, and this continued until May, when the current price for average specifications was £10 c.i.f. These early shipments were welcomed as a cheap and profitable substitute for Rigas along the West Coast ports, where stocks had become denuded to an almost unprecedented degree. The strike at St. John in June, resulting in a partial cessation of shipments, led to some recovery in prices, which lasted until September, when heavy shipments began to pour in by the liners, and as a consequence prices have recently receded 10s.-15s. per standard in such ports as London and Liverpool. The market in Canada for next season is regarded as particularly strong, so that the position is now somewhat anomalous—prices receding on this side concurrently with a strengthening market in Canada.

Annual import into London from 1st January to 31st December was as follows:—

		1913	1912	1911	1910	1909	1908
Deals (Fir)	Pieces	6,712,627	6,143,393	5,521,400	5,954,803	6,368,310	4,609,794

Wood Imports into England

Churchill & Sim, London, Eng., in their annual wood circular give the following analysis of wood imported into the United Kingdom during recent years:

Wood imported into the United Kingdom in the following years:—

	1911	1912	1913
	Loads	Loads	Loads
Colonial Deals, Battens, etc.	998,167	895,496	961,539
Colonial Timber and Hardwoods	39,368	53,109	39,656
Foreign Deals, Battens, and Boards . . .	4,574,093	4,872,093	5,674,598
Foreign Timber and Hardwoods	3,690,650	3,783,423	4,340,665
Colonial and Foreign Staves	158,396	169,295	182,131
Total, in Loads	9,460,674	9,773,416	11,198,589
Value	£23,800,586	£26,238,259	£30,878,619

London's Imports from Canada

Importations into London from Canada during recent years were as follows:—

			1910	1911	1912	1913	
			Pieces	Pieces	Pieces	Pieces	
Pine Deals, etc., from the St. Lawrence.			563,000	400,000	590,000	508,000	
Spruce Deals, etc., from the St. Lawrence..			969,000	970,000	804,000	1,155,000	
Birch Deals, etc., from the St. Lawrence..			283,000	320,000	342,000	303,000	
Spruce Deals, etc., from New Brunswick, etc.			635,000	436,000	490,000	468,000	
Birch Deals, etc., from New Brunswick, etc.			326,000	249,000	400,000	373,000	
Timber	1907	1908	1909	1910	1911	1912	1913

Birch, Nova Scotian, etc....	123	310	487	238	138	225

The pine deal trade in London, once such an important part of the general wood business of the port has gradually shrunk to very small proportions, and is now the specialty of a few merchants, where formerly it was a feature in the stocks of many. The scarcity and consequent high prices of the better qualities are responsible for the decline in this particular trade, consumers having been driven to make use of cheaper substitutes. There has been little change in prices and few general market transactions. Spruce deals have come forward rather more freely in a season in which whitewood from all producing countries has been in strong demand, and in spite of the check to importation occasioned by strikes at Riga and St. John, the year closes with a heavier stock than usual, and weaker London prices in consequence. The action of the United States foreshadowed twelve months ago, of removing the duty on Canadian lumber crossing the border having now been passed by Congress, the effect will doubtless be felt in the near future. It is only natural that the United States should seek its supplies from as near home as possible, and the artificial barrier of a tax on lumber was bound to be broken through as soon as it was found that the native production was insufficient for the needs of the country. One result must be to throw the European demand more strongly on to Russian and Swedish whitewood for the future, as supplies of Canadian spruce for this country get scarcer and dearer. There has been a rather larger arrival of yellow pine, elm, and birch timber during the year. Birch planks have been a good market. The supply was somewhat checked by the strike at St. John, and there was no excessive importation in consequence.

British Columbian and Oregon Pine

The market for Oregon pine was steady during the whole of 1913; the effect of a severe fall in the rates of freight, which became accentuated during the late summer, will not be felt until the autumn of 1914, when the sailing ships chartered at reduced rates should begin to arrive. The fact that timber of extreme lengths cannot be supplied from any other sources, invests the Oregon pine trade with a security which keeps values steady so long as there is no temptation to over-production. Although pitch pine prices, on account of the great decline in tonnage rates, have fallen some 30 per cent., in the year, the fall in price of the long special logs is no more than 10 per cent., owing to the small proportion of such logs obtainable. The initial cost of lumber declined rather sharply during the summer on account of the failure of the Australian demand, but quotations are inclined to harden again. The preference of buyers for northern wood has been fully justified in the past, but some exceptionally fine cargoes from Portland arrived during the year, showing that exporters are now exercising more care in their selection of logs than was formerly the case. Some progress was made with the sale of silver spruce and clear douglas fir, and if they were not so expensive there should be a good prospect for the future of these woods, unique as they are in quality and in size. Just now the shipments of spruce have accumulated and it will need some patience to maintain prices. The consumption is limited, and demand cannot be forced except at sacrifices which are not necessary.

New Year's Trade at Glasgow

Cant & Kemp, Glasgow, in their annual timber market report, say:—

The year which is now closing has, generally speaking, been one of great industrial activity. The years 1911 and 1912 were both satisfactory, but this year has surpassed them, and it may be stated that 1913 has attained the highest level of prosperity which the trade of the nation has ever known. These results would have been even greater, had it not been for the difficulties which have surrounded the labour market, and while actual strikes were perhaps fewer than in 1912, many employers have had to contend with difficulties which are very troublesome to remedy, e.g., that of broken time. This has been very apparent in shipbuilding, and employers have been greatly handicapped through the difficulties in this respect. Many yards have been greatly disorganized, work delayed and contracts not completed up to time. Further, it is freely stated that higher wages than ever are now being paid, and employers are getting less real value for their money.

On the whole, the year 1913 has been a good one for the timber trade, but unfortunately 1914 does not look so promising. The demand during the earlier part of the year was steady, while during the later months, the enquiry was very limited. Generally speaking, stocks show a substantial increase and there is a feeling that in several items prices will be weaker. At present this market

is suffering from a species of indigestion and requires careful dieting, if not a spell of starvation. Both importers and merchants are carrying stocks that are more than ample for present or prospective demands, and it is to be regretted that the requirements of consumers appear to be a steadily diminishing quantity. By far the largest call on available stocks has been that of shipbuilders, but they are now getting well through their contracts, and their future requirements will depend entirely on what new work they may secure. The wagonbuilders are accumulating stocks from deliveries against contracts, with the result that there is very little demand for the ordinary consignment parcels of oak planks. The requirements of the housebuilding trade cannot well be less than they have been, and it is anticipated that the demand from the cabinetmakers though small, will remain steady.

Shipbuilding on the Clyde has again had a record year having considerably surpassed the year 1912, the total vessels launched being 370 measuring 756,976 tons as against 389 vessels measuring 640,529 tons, being an increase of 116,447 tons. While over Scotland there have been 505 vessels launched, measuring 809,711 tons as against 520 vessels measuring 688,188 tons, being 15 vessels less and 121,523 tons more than in 1912. The class of work has been good all through the year.

The prospects for the coming year cannot be looked upon as being as favourable as they were a year ago. This view seems to be the general one, judging by the entire absence of speculative buying, and the only thing that can bring business to a desirable condition will be an increase in the general demand and an absence of indiscriminate consignments.

Quebec yellow pine waney boardwood.—The stock is somewhat heavier than at this time last year. Quotations are—3s. 6d. to 5s. 6. per cubic foot.

Quebec red pine.—The stock is nil with hardly any enquiry.

Quebec oak.—The stock is considerable. There is a moderate enquiry which is chiefly for first-class parcels. Quotations are 3s. 6d. to 4s. 6d. per c. ft. according to quality and specification.

Quebec elm.—The stock is very similar to what it was at this time last year. The demand is fair and prices are firm, particularly for first-class lots.

Birch.—The stock is heavy, consisting chiefly of round logs which are mostly in consumers' hands. The stock of planks and boards is also heavy with a moderate enquiry. Quotations are—Logs, 1s. 8d. to 2s. 6d. Planks and Boards, 1s. 3d. to 1s. 10d.—all per cubic foot according to quality and specification.

Quebec yellow pine deals, etc.—The stock of all grades is small. The demand is chiefly for the lower qualities. First pine deals and sidings are only occasionally asked for and the same remarks apply to Californian pine sidings and sugar pine planks which have now become strong competitors with Canadian goods. Prices are fairly firm and may be quoted as follows, viz.:—First—Broad, 5s. 3d. to 6s.; Regulars, 4s. 9d. to 5s. 3d.; Undersized, 3s. 6d. to 3s. 9d. Second—broad and regulars, 3s. 6d. to 4s.; undersized, 2s. 4d. to 2s. 9d. Third—broad and regulars, 2s. 2d. to 2s. 8d.; undersized, 1s. 8d. to 1s. 10d. Fourth—broad and regulars, 1s. 7d. to 1s. 10d.; undersized, 1s. 3d. to 1s. 5d. Good Sidings, 3s. 6d. to 5s. 6d. all per cubic foot according to specification.

Red pine.—The stock is light with only a limited enquiry.

Quebec spruce deals.—The stock is moderate. The demand is only fair. Prices are firm. Quotations are—9 inch and up, 1s. 4d. to 1s. 6d.; 7 and 8 inch 1s. 2½d. to 1s. 4d.—all per cubic foot.

The following table gives particulars in connection with the various items:—

Memo. of Stocks of Timber in Clyde at 31st December, 1912 and 1913 with Statement of Imports and Consumption for Year Ending 31st December, 1913.

New Brunswick and Nova Scotia Stocks at Glasgow

Calder, Henderson & Livingston, Glasgow, in their annual timber market report, say:—

Birch logs.—The import was light and chiefly on contract; values are steady and the demand quiet. Planks were in fair demand and values were steady. Arrivals were heavier towards the latter part of the year, and the stock at present is ample, as enquiries are not numerous.

Deals and battens; pine, were seldom asked for. The stock is practically exhausted. Spruce arrivals on consignment were light in the early part of the year and in the absence of shipments from the Baltic there was a good demand and values were firm. Later on the competition of Riga goods, which are of a better manufacture, and also the fear that freights would weaken and prices be lower, caused the demand to be very quiet. Values became easier and dropped to a lower level on the arrival of the winter liners with deals, carried at a much reduced rate of freight. The sizes most affected were 8 inch and under. Quotations are nominal and stocks are heavy considering the restricted enquiry at present in evidence.

Heavy Stocks and Low Prices at Liverpool

Smith & Tyrer, Limited, Liverpool, Eng., in their monthly market letter, say: The high prices ruling at the commencement of the year, coupled with a growing conviction later on that some easing in values was due, helped to restrict the demand, and the drop in freights as the season advanced in-

creased the want of confidence, with the result that consumers have been holding off. The year closes with heavy stocks of many descriptions and a considerable drop in value on the purchase price. The outlook is not encouraging so far as the demand from the manufacturing trades is concerned, but it is hoped there will be sufficient improvement in the building trade to offset other deficiencies. Spruce deals have barely kept their level although the import has been light. Russian prices have weakened and the competition of this wood has become keener. The market for birch planks is inactive and values keep at a low point. Logs are wanted and the supply small. Hemlock is rarely asked for. Pine is affected by the imports from Siberia and elsewhere, and Canadian shipments are suffering therefrom. The stock of Douglas fir logs is ample and moving off slowly. Spruce has fallen in price but not sufficiently to bring in buyers.

Stocks of timber, deals, etc., in Liverpool, Birkenhead, Garston, etc., for the month ending December 31st, 1913, and previous years included the following:—

	Import		Consumption		Stock

WHY you should install the Mahony Blower

System in your Planing Mill

Fifty per cent. higher efficiency than any other on the market to-day, uses 1/2 less power, costs less to install, no cyclone required, eliminates back pressure on the fan.

I will undertake to increase the capacity of any system now installed 50 to 100% by the application of the Mahony Back Pressure valve on your fan, without using a scrap more of horse-power.

YOU NEED this apparatus in your plant

Write to-day for prices

A. Mahony, 512 Wellington West, Toronto

Let us lift you
above roofing
competition

There is no money in ordinary roofings that have to be sold at cut prices. Your profits are so small that it scarcely pays to handle them.

Let us place you above unjust, ruinous, cut-price competition by appointing you our exclusive dealer in your town for

J-M ASBESTOS ROOFING

When you sell this roofing you make big profits because you don't have to cut your price. And you practically get a monopoly of the roofing business in your territory because J-M Asbestos Roofing is different from all other roofings.

Made of alternate layers of Asbestos felt and Trinidad Lake Asphalt. Contains nothing to rot or deteriorate. Gives perfect fire protection. And on account of its all-mineral character, never requires coating or graveling.

Write today for Special Dealer Proposition.

Death of Mr. Martin Burton

Mr. Martin Burton, one of the best known lumbermen in Ontario, died on January 20th at his home in Barrie, Ont., death being the result of weakness of the heart, from which he had been suffering for some months. Mr. Burton's activities in the lumbering industry were greatest a number of years ago and he was not so well known of late as others who have come up in the industry since those days. Throughout his life, Mr. Martin Burton was one of the foremost men in business circles in Ontario. He was a son of the late John Burton, a lumberman, and was born at Millbrook, Ont., 62 years ago. When a boy he moved to Barrie and early in life became identified with the steamboat business on Lake Simcoe. With his brothers, the late James L. Burton and George Burton, he operated the steamer *Ida Burton*, which they owned. This was about the year 1870. His brother George Burton was drowned about that time. When the Northern Railway was constructed north from Barrie, James L. Burton and Martin Burton formed a partnership which was carried on, up to the time of Mr. Martin Burton's death, under the name of Burton Bros. They went extensively into the lumber manufacturing business and were very successful. After the death of Mr. James L. Burton, Mr. Martin Burton continued in the lumber business, but went more extensively into the manufacturing of square timber. Their large mill at Byng Inlet, Ont., was burned a number of years ago. Burton Bros. were also active in the purchase of timber limits in various parts of Ontario and also in the United States. Recently Mr. Burton acquired large interests in Wisconsin, where extensive quantities of square timber are being taken out. Mr. Archie Burton, son of the late Mr. Burton, was in Wisconsin at the time of his father's death, looking after the business.

Mr. Martin Burton was one of the outstanding figures in the development of Barrie. With his brother, Mr. Jas. L. Burton, he was one of the original organizers of the Barrie Electric Light Company, which was formed to supply light to the town at a fixed sum per year. They secured their power from a stream from Little Lake near Midhurst, but after a few years this became inadequate for the growing demand, and the power house was built in Barrie. The company was taken over by the town when their franchise expired, and the same power house was improved and enlarged. The Barrie Gas Company, of which Mr. Burton was the president, was another company which he and his brother took over shortly after the Electric Light Company was formed. For a number of years Mr. Burton was general manager of the Northern Navigation Company, and at the same time Mr. Jas. L. Burton was president of the same company. Mr. Burton was vice-president of the Barrie Carriage Company.

Mr. Burton is survived by his widow, who was a daughter of the late Arch. Thomson, one of the first families of Barrie, and by one daughter, Mrs. Nat. Dymont, and one son, Archie. He was the last surviving member of the Burton family of lumbermen, who have been known as among the largest dealers in lumber in the province for many years.

Sudden Death of G. G. Miles of Toronto

The sudden death of Mr. Geo. G. Miles, lumber dealer and sash and door manufacturer, as a result of heart failure, which occurred on January 13th, came as a great shock to the lumber trade of Toronto. A serious fire was in progress in buildings at the rear of his planing mill, when Mr. Miles, while occupied at the telephone, fell back dead. Mr. Miles' own office building at 536 Dundas street, was only slightly damaged, although at the time of his death it appeared to be in imminent danger of destruction.

Mr. Miles, who was 64 years of age, was one of the most prominent lumbermen in the city of Toronto and was engaged in a very

large way in the business of woodworking contracting. Among the large undertakings for which he furnished material during recent years were, the new Western Hospital, Sir Henry Pellatt's residence and the recent addition to the Robert Simpson Company's store. Mr. Miles was at one time a member of the Parkdale Town Council and was a past president of the Caledonian Society. He took an active part in politics and at one time was an unsuccessful candidate for the Ontario Legislature. He leaves a widow, two sons and two daughters.

Death of David Richards of Campbellton, N. B.

The death of Mr. David Richards, which occurred at Campbellton, N.B., recently, removed from the ranks of New Brunswick lumbermen one of the best known and most successful operators in Eastern Canada. Mr. Richards had been in poor health for some time, and death was the result of an attack of apoplexy. The late Mr. Richards, who was in his 73rd year, was born in Hampton, York County, and devoted his early years to farming. About thirty years ago he entered the lumbering business, becoming a member of the firm of The Wm. Richards Company, with head office at Boiestown, N.B. The first lumbering operations conducted by the firm were carried out on the Miramichi. Later, Mr. Richards moved to Campbellton, becoming manager of the company's branch at that place. Under his direction the business increased greatly. The company now have three large mills in operation.

The late Mr. Richards took deep interest in all the affairs of his town and at the time of the disastrous fire which destroyed Campbellton, he set an excellent example in assisting the citizens in rebuilding their homes. Mr. Richards was a man of kindly disposition and remarkable business tact. He leaves three sons and four daughters.

Death of Mr. W. A. Crombie

Mr. W. A. Crombie, senior partner in the firm of W. M. Crombie & Company, New York, and selling agents of Mr. E. H. Lemay, Montreal, died in New York on January 3, aged 69. Mr. Crombie lived for many years in Burlington, but 22 years ago took up his residence in New York city, and during the whole of the latter period had business relations with Mr. Lemay. He was greatly esteemed both in social and business life. The business will be continued under the management of the two sons, Messrs. W. M. and A. C. Crombie.

Pulp and Paper Trade With United States

A striking growth in the export of Canadian pulp and paper to the United States and a substantial increase in such imports from that country is shown by the official figures for Canadian trade during the 1913 fiscal year, issued by the Trade and Commerce Department.

According to this report the export to the United States of wood blocks for pulp was \$6,806,945 in 1913, as compared with \$5,697,901 in 1912, while the exports of paper were nearly double, \$4,390,144 in 1913, as compared with \$2,086,304 in 1912 and \$2,075,889 in 1911. The paper export was divided as follows: Felt paper, \$3,240, as compared with \$5,235 in 1912; printing, \$4,242,298, compared with \$1,989,863 in 1912; wall paper, \$7,107, compared with \$6,568 in 1912; wrapping, \$96,922, compared with only \$68 in 1912, a striking increase.

The import of wood pulp from the United States was \$191,345, compared with \$49,991 in 1912, a heavy increase. The total imports of paper were \$5,754,156, as compared with \$4,221,220 in 1912, of which the largest items were: Paper, manufactures of, N. O. P., \$1,787,319, compared with \$1,284,467 in 1912; wrapping paper, \$1,368,366, compared with \$916,445 in 1912; tarred and building paper, \$684,484, compared with \$257,430 in 1912; printing paper, \$499,096, compared with \$489,555 in 1912.

Prairie Province Business Uncertain

Indications of Improvement Noticeable, but Loan Companies and Banks Still Holding the Reins—Opinions of Prominent Lumbermen

IN the prairie provinces, as in other parts of Canada, the lumber market situation to-day presents so uncertain an aspect that few members of the trade are disposed to venture anything in the form of a prediction regarding the probable course of trade during 1914. Although a growing feeling of encouragement is evident, the financial situation in general is such that definite forecasts are unsafe. A few lumbermen, however, who have watched developments closely, have expressed their views to the Canada Lumberman in a guarded manner, and from them, the following outline of last year's trade and the prospects for 1914, has been prepared.

There is no question that business in the west was comparatively quiet during 1913, especially during the last six months. A few large concerns report fairly brisk conditions during the first half of 1913, but on the whole, the year was unfavorable to the industry. The gross business transacted was considerably less than that of the year preceding. Some firms report a falling-off of as much as 35 per cent, while hardly any have experienced any increase in business. It is probable that, in the aggregate, a decrease in the lumber trade of Manitoba, Saskatchewan and Alberta, of from 25 to 30 per cent., took place in 1913, as compared with 1912. This is a large amount, but in judging of its importance it must be recalled that 1912 was an exceptionally good year, which should not be taken as a basis for comparison. Conditions during the past twelve months probably appeared worse than they really were, on account of the unusual prosperity which preceded.

Rural and City Trade Decreased

Both rural and city trade fell off during 1913. The policy of restriction which was adopted by banks and loan companies throughout the country resulted in a general curtailment of building operations, with a corresponding decrease in the demand for lumber. In addition to this the harvesting and marketing of the biggest crop on record kept the farmers fully employed throughout the fall, and prevented them from attending to repairs and additions to their farm buildings. Another factor in the situation is that the building boom of the previous year increased the supply of dwellings and office buildings available in many western cities beyond immediate requirements, and while, at present, the requirements of the rapidly-growing population have done a good deal to overtake the surplus in accommodation, it is probable that there still exists an oversupply which will take a portion of the coming year's expected immigration to absorb.

The local demand for lumber in Winnipeg has been very well maintained. The total of building for the year shows only a slight decrease as compared with that of 1912, and firms carrying on a purely city trade report a good volume of business. In the smaller cities, however, and in the rural districts, things have been rather different, and reports from line yard concerns vary greatly. Some districts, notably that which has Swift Current as its centre, seem to have experienced a very active demand, while from the head of the lakes, reports of generally favorable conditions as regards demand have been received. In other neighborhoods trade has been unusually dull, while quietness has been the key-note of the prairie trade.

At present, the lumber industry is seasonably quiet. Stocks are reported variously, as normal or low, and as soon as the demand upon the retail dealers becomes active with the opening of spring, a good deal of buying will take place. Prices at wholesale are firmer, and collections are reported as satisfactory.

Optimism Commencing to Appear

Turning from the past and the present to a consideration of the possibilities of the future, we are, at once in the realm of conjecture, and of rather wild conjecture at that. Many of the lumbermen interviewed in this connection, though willing to talk, did not wish to place their opinions before the public, and those who were less reticent were very guarded in making definite statements. The general sentiment, however, is undoubtedly one of optimism. Developments will depend to a great extent upon the policy adopted by the loan companies and the banks. If these loosen up, a prosperous year is assured. As these institutions cannot afford to hold money beyond a certain point, and as it is believed that there is already a fair amount of money on hand, it appears as though they will find it advisable to adopt a somewhat more liberal policy. This, coupled with the fact that there is likely to develop during the year a fair demand, at least, for buildings should stimulate the lumber industry. No exceptional activity is to be anticipated, but the indications are that the coming year will witness a material improvement in the lumber business of the west generally. It is certain that the retrenchment which has been forced upon the country during the past months, and the more cautious methods which will

probably prevail in business for some time to come, will help to place the development of the west on a more assured basis than it has ever been on previously, and will make for a sounder, if a less spectacular, prosperity.

Speaking of the situation generally, Mr. A. K. Godfrey, manager and secretary of the Monarch Lumber Company, and president of the Winnipeg Grain Exchange, stated that, in so far as it was possible to judge from present indications, it was his opinion that the coming year would be a good one from the point of view of the lumber industry, though he admitted the difficulty of forming a definite judgment. Stocks, he believed, were normal, perhaps lower than normal. Under the present financial situation dealers were not inclined to speculate in lumber. Mr. Godfrey expressed the opinion that retail merchants generally would, in the future, go easier on credits, and that, while this might circumscribe to some extent the volume of business transacted, it would certainly establish the trade on a more substantial foundation than it has been on in the past. He also pointed out that during the past few months a process of general re-adjustment had been, and still was going on. While this had had a depressing influence on trade, it had served a good purpose, and would react to the eventual good of the country.

Difficult to Foretell Anything

H. S. Y. Galbraith, manager of the British Columbia Mills, Timber & Trading Company, Limited, in Winnipeg, expressed the following opinion: "In the present condition of the lumber industry and the financial business it is difficult to make any forecast. I fancy, however, that lumbermen in the prairie provinces may look for a good rural trade during the present year. In the cities trade may continue rather quiet, as in more than one western centre building has been rather overdone, with the result that there will be a smaller demand in such places for new structures, and as a consequence of this, a light call for lumber. Stocks in the retail yards are, however, generally light, and this will lead to considerable retail buying as soon as the season opens and the demand becomes active. A number of the mills have also been successful in reducing and breaking up stocks to a considerable extent, and this will necessitate a good volume of manufacturing, to meet the needs of the coming season. I do not look for a boom, but I think a very fair volume of business will develop as time goes on, particularly during the later summer, should crop prospects be good. The financial situation is improving, and should show further improvement as time goes on. The banks have lots of money, and will release it for legitimate undertakings."

A. R. Cavanaugh, of the Red Deer Lumber Company, stated that during the past year the demand for spruce lumber had been good, and that, while trade at present was seasonably quiet, the prospects for the coming year were good. Referring to the financial situation, Mr. Cavanaugh said that collections had been good, and money promised to be freer during the coming year than it had been during 1913. He also stated that the season had been an excellent one for logging.

Outstanding Credit a Factor

G. H. Wall, manager of the Dutton-Wall Lumber Company, said that he thought the coming year would be much the same as the past year had been. There was still so much outstanding credit in the lumber business that business of this nature would have to be curtailed. This would react against any causes tending to a material betterment of business activity. Speaking of the financial outlook, Mr. Wall expressed the opinion that money would remain more or less tight for some time to come, and that, while the banks had sufficient for legitimate enterprises, they were not inclined to lend on anything of a speculative nature. Collections had been little better than they were at a corresponding period of last year. Referring to stocks, Mr. Wall stated that the spruce mills of the prairie provinces were carrying an average stock, as were the mountain mills, and that at the coast the mills generally were short on commons and long on the higher grades.

Drawing a mean through these opinions, and judging, so far as one may, by the present trend of business, the situation is best summed up in the words of a well-known Winnipeg wholesale lumber dealer, who desired to remain anonymous. He said, "We don't know, but we hope. It is impossible to forecast conditions. A little war somewhere might throw things back, while an industrial depression in England would bring money into the country, and things would boom. Apart from these eventualities, it is probable that some improvement will take place during 1914, and that such improvement will be maintained until prosperity reaches a high water mark. But that may not be for two, or even three years yet."

The Linderman Dovetailer

The latest way to More Profits

Three Points for Consideration

The Linderman Automatic Dovetail Glue Jointer will enable you to solve three important problems. **Yielding \$4.00 to \$6.00 more profit per thousand.**

1st 4" Common Lumber

In most Western Mills this is sold for approximately \$7.50 per thousand, whereas 8" shiplap brings from \$14.00 to \$16.00.

THE LINDERMAN DOVETAILER will take two 4" strips, convert them into a board 7 $\frac{3}{4}$ " wide, allowing $\frac{3}{4}$ " for jointing both edges to make the lap, leaving a full 7" face, at a cost of 75c. per thousand board feet. Add the cost of handling the lumber and of milling it into shiplap, leaves a net profit of at least \$4.00 a thousand.

2nd No. 3 Grades, 6", 8" and 10" wide

In most Western Mills No. 3 Grades increase in price perceptibly as it increases in width. One prominent lumber manufacturer maintains by converting 6", 8" and 10" widths of this grade into 12", 14" and 16" lumber, he will be able to obtain fully \$4.00 a thousand more for it.

The cost of jointing this lumber on a LINDERMAN MACHINE is 75c. per thousand, leaving a net profit of \$3.25.

3rd 2" and 3" Strips

Practically all mills leave in the slab or convert into lath all lumber, regardless of the grade, under 4" in width. By installing a LINDERMAN MACHINE and by saving all 2", 2 $\frac{1}{2}$ ", 3" and 3 $\frac{1}{2}$ " stock this lumber can be converted into any width board desired at a cost which will average approximately \$1.00 per thousand board feet. Profit from \$4.00 to \$8.00.

We are willing to send, at our expense, several pieces of 16' long 8" lumber joined by our method, in spruce, to any Lumber Manufacturer in the Dominion to be milled by his usual method inspected and put to any test as to strength, durability and equality as compared with 8" one-piece stock or we will join up any lumber which we can purchase in our local markets, if spruce is not acceptable, or will join, free of charge and will stand transportation charges both ways, any lumber which may be sent to us up to 1,000 feet.

A LINDERMAN DOVETAILER installed in your mill should and can save you at least \$5,000.00 a year, if not more. We realize thoroughly this is a large figure, but would like the opportunity of putting our proposition before you so that it may be thoroughly considered by you and your assistants.

Anglo-Newfoundland Company had a Good Year

The annual report of the Anglo-Newfoundland Development Company for the year 1913 shows that the gross profits of the company, after making provision for depreciation, amounts to £65,000, which compares with £51,200 in the preceding twelve months and £34,700 in 1910-11. Debenture interests absorbed £24,800 and a further £10,000 was set aside for the redemption of the debenture debt. This leaves a net profit of £30,100, which compares with £9,800 in the previous year, when, however, although there was no charge for debenture redemption, a sum of £16,400 was written off out of revenue to cover the expenses of the issue. The result of the year's operations is to leave a balance in hand, including the sum brought forward, amounting to £45,200. This would have sufficed to pay a modest dividend on the preferred ordinary shares and still leave a good balance. The directors, however, decided to carry the whole balance forward and thus strengthen the financial position of the company.

The annual report of the directors states that the output of the mill is increasing and the quality of the paper and pulp continues to give satisfaction. Already the whole of 1914 production has been sold. In 1911-12 the company's profits were earned out of an output of barely three-fifths of the capacity of the completed mill, while the company suffered as a result of shipping and coal mining strikes. The last year's production would have been considerably greater had it not been for the fact that while improvement was made in the efficiency of the mill, this was offset by a further rise in the price of coal and partly also by high freight rates. The report indicates that the removal of the duty on pulp and newspaper by the United States has improved the company's outlook, as the mills are capable of supplying far more than the requirements of the newspapers in England which control its share capital. The report states, however, that further expansion of the company's operations will be made during the continuance of the present Newfoundland tariff.

New Track Scale Regulations

Complaints which have been made by Canadian lumbermen and paper manufacturers regarding the weighing of shipments on railway track scales may be obviated by a series of new regulations regarding weights and measures which have been promulgated by the government at Ottawa. The new schedules considerably reduce the margin of toleration of error in railway track scales. They are as follows: Scales of 30 tons capacity must have sensitiveness when fully loaded of 10 pounds; greatest error not to exceed 15 pounds fully loaded; 40 tons capacity, sensitiveness must be 12 pounds and greatest error, 18 pounds; 50 tons capacity, sensitiveness must be 14 pounds, and greatest error 22 pounds; 75 tons capacity, sensitiveness, 17 pounds and greatest error 30 pounds; 100 tons capacity, sensitiveness 20 pounds, and greatest error 40 pounds; 150 tons capacity, sensitiveness 25 pounds, and greatest error 50 pounds; 200 tons capacity, sensitiveness 30 pounds, and greatest error 60 pounds.

The Cooperage Stock Trade for 1913 and 1914

By J. Innes

The output of cooperage stock for the year 1913 was considerably less than the output that we anticipate for 1914. Quite a large quantity of stock had been imported from the United States at high prices, and not always very satisfactory stock, to take care of the trade. This stock was brought in cheaper than normally, on account of the depression in the United States making prices very much less than the average.

The winter of 1912-13 was a very unfavorable one in Canada, from one to two weeks sleighing being all that the millmen had and the consequence was that the stocks of logs and bolts at the mills was small, some mills only running from 30 to 60 days.

The demand for cooperage stock in Canada, throughout the year was good while the apple barrel demand was below the average. Still everything that could be produced was used and stock had to be imported to supply the trade.

Prices throughout the year were about ten per cent. higher than in 1912, but owing to the limited production, very few mills made money, as the overhead expenses for twelve months had to be made on a short run.

The outlook for 1914 is very promising. Nearly all of the large consumers are placing heavier contracts than a year ago, at an advance of 10 to 15 per cent., according to the class of goods. The only unpleasant thing at the present time for the manufacturer is that the winter has been a very poor one and very little stock has been taken out. There is, however, practically two more months of winter yet to come and the millmen are in hope that they will get logging weather during the latter part of January and the whole of February and probably part of March. If mild weather continues, the output will be very limited.

Elm staves, basswood and soft maple heading and elm hoops are still favorite goods for all classes of barrels but hardwood staves are gradually working in on the market and there is likely to be more hardwood staves produced in Canada this year than ever before. As soon as the manufacturers have learned to make these staves in a satisfactory manner, there is no doubt that they will take the place of elm to a very great extent and prove satisfactory.

Birch heading is now being used considerably and is being made in first class shops. Nothing has yet been found to take the place of elm hoops in a satisfactory manner, although for some purposes wire or iron hoops are being used, where the packages do not require strength to prevent the contents being crushed. For export, for articles that are liable to be damaged, elm hoops are still the prime necessity.

Every indication at the present time promises a good business throughout the year in Canada and millmen are inciting themselves to try and get in a good supply of barrels.

Graddon & Owens, dealers in lumber and timber, 11 St. Sacrament Street, Montreal, P.Q., have sent out an attractive calendar for the year 1914, the picture upon which represents an imposing "Monarch of the Forest." The picture is in a rich sepia and is mounted upon a buff colored board, making a very pleasing effect.

Mr. W. S. Loggie and Mr. W. B. Snowball, of Chatham, N.B., visited Toronto on business during the third week in January.

The Hepburn Scotch Derrick

Among the many labor-saving devices adopted by the lumbering trade of recent years the crane and derrick possibly takes foremost place in the handling of heavy logs and timber both in woods operations and at the sawmill. This work used to be done by the man on the job and the result was that accidents and mishaps were very frequent. The introduction of the derrick has resulted in the practical elimination of these accidents and a great saving in labor as well. One of the best known manufacturers of this line in Canada is John T. Hepburn, Limited, Toronto. The Hepburn model Scotch derrick has built a reputation for this firm from coast to coast. In the manufacture of their derricks each operation, from the moulding of the castings to the assembling of the parts, is watched over with the greatest care, while only the finest and most dependable materials are employed in their construction. All parts are easily and quickly replaced, being stock and standard sizes. Derricks range in size from $\frac{3}{4}$ ton upwards. Sizes up to four tons are either in stock or in course of construction while sizes larger than four tons are made specially to order. Logging contractors and sawmill operators who have used the Hepburn derrick state that they are more than satisfied with them as they are especially adapted to the peculiar needs of the sawmill trade. Those interested should write the John T. Hepburn Limited, for their catalogue showing all sizes and styles in cranes and derricks.

Smart Woods Issue Unique Calendar

A unique calendar has been issued this year by Smart Woods, Limited, of Ottawa, Montreal, Toronto and Winnipeg, manufacturers of lumbermen's and contractors' supplies, tents, flags, awnings, tarpaulins and clothing. The calendar is an exact reproduction of the Dominion Ensign, both as to shape, size and color effect. Over the front of the ensign is suspended by a chain, a large shield on which appear the calendar pads. It is most attractive and unique and there has been a great demand for them from all parts of the country.

Preston Woodworking Machinery Company Busy

The Preston Woodworking Machinery Company, Limited, report that their plant is very busy and experiencing an active trade. Reports which have recently appeared of the closing down of a plant of a similar concern at Preston, Ont., have some times been misinterpreted, leading to an impression that the company referred to is the Preston Woodworking Machinery Company, Limited. For this reason the Preston Woodworking Machinery Company, Limited, are anxious to make the fact known that their plant is running along briskly.

Simonds Company Open New Office

The Simonds Manufacturing Company, with factories at Fitchburg, Mass., and Chicago, Ill., opened a new office, on the first of the year, at 209 Madison Ave., Memphis, Tenn. A complete stock of Simonds saws suitable for that territory, Simonds planer knives and files will be carried at the new store. The Memphis branch is under the management of Mr. William L. Mayer who formerly represented the company among the mills in Virginia and North Carolina.

EDGINGS

Ontario

A fire occurred at the planing mill and lumber yard of A. Coates & Sons, Burlington, Ont., early in the morning of January 27th and caused heavy loss.

The Sutherland, Innes Company, Limited, Chatham, Ont., are considering plans for the erection of a cooperage plant at Corinth, Ont., at a cost of \$30,000.

The sawmill plant at Rainy River, Ont., formerly owned by the Rainy River Lumber Company is being taken down and shipped to Ludlow, B.C., where it will be set up and operated.

The Lusty Lumber Company, Rodney, Ont., whose mill was recently destroyed by fire, and who installed a portable mill to cut the stock they had on hand, report that they do not expect to erect a permanent mill.

The Holt Timber Company, Whitestone, Ont., report that they sold all their logs during 1913 and did not manufacture any lumber. They intend to manufacture about 9,000,000 feet, mostly white pine, during 1914.

Wm. Ellery, Fenelon Falls, Ont., reports that his plant is now practically ready to saw lumber again. He is considering the installation of a small double edger, also a 15 h.p. portable engine to assist his stationary engine in its drive.

The Empire Lumber Company whose mill is located at Latchford, Ont., have decided to close the mill. The company did not manufacture any lumber last year. They are now making arrangements for the disposal of the mill, which probably will be sold.

The office of the Schuster Coal & Lumber Company at Belleville, Ont., was recently destroyed by fire which caused a total loss of \$30,000 to the Schuster Company's block in which its own office and a number of others were located. The insurance is reported at \$14,000.

The Canadian Handle Company, Oxford Street, Strathroy, Ont., are arranging to erect a handle factory at a cost of \$50,000 on Oxford Street, Strathroy, Ont., to replace the building recently destroyed by fire. The company will be in the market for woodworking machinery.

The French River Lumber Company, Limited, has been granted a charter with a share capital of forty thousand dollars and headquarters in Toronto. H. E. Hurlburt is one of the principal men in the new concern, which is empowered to carry on lumbering and timber operations in all branches.

Aird Island Logging and Trading Company, Limited, has been incorporated with a capital of \$10,000, with head office at Spanish Mills, Ont., to carry on business as lumber merchants. The provisional directors are R. McKay, D. I. Grant, M. MacDonald and G. Adams, all of Toronto, Ont.

The Sutherland, Innes Company, Limited, Chatham, Ont., have purchased the plant and timber limits of W. M. Drader, of Chatham, Ont. They expect that this will increase their output to the extent of about 6,000,000 staves, 3,000,000 to 4,000,000 hoops and 500,000 sets of heading annually.

"Woodworkers Limited" have been incorporated, with head office at Toronto and capital of \$40,000. Those interested are L. J. Strickland, 555 Huron street, Toronto; A. B. Beverley, 17 Westminster avenue, Toronto, and P. E. Heeney, Berlin, Ont. The company will deal in lumber and carry on a woodworking and planing mill business.

The Ontario Transportation and Pulp Company, Limited, has been incorporated with a capital of \$10,000, with head office at Thorold, Ont., to carry on a water transportation business and operate as lumber merchants. The provisional directors are R. R. McCormick, Chicago; Warren Curtis, Jr., and G. S. Brack, and F. A. Dean, Jr., all of Thorold, Ont.

The Lakes Timber Company, Limited, has been granted a charter, with a capital of \$50,000 and head office in Fort Frances, Ont. The company is to cut timber and to manufacture and sell wood and timber products and carry on the business of lumbermen. The incorporators are William J. Law and Andrew A. D. Rahn, of Minneapolis, Minn.; Otto H. Diercks, of Rainy River, Ont.; Alonzo B. Colburn, of International Falls, Minn.; and William F. Zauke, of Spooner, Minn.

The Lumsden Lumber Company, Limited, has been incorporated, with capital stock of \$500,000 and head office at Ottawa. The well-known lumberman Mr. John Lumsden is managing director of this company. Its mill will be located at Amos, 140 miles east of Cochrane, Ont., and 349 miles from Quebec. Amos is on the Harricannaw river and the Transcontinental Railway. The company will erect, as soon as spring opens, a sawmill, planing mill, clapboard mill and tie mill. They will cut in the neighborhood of 20,000,000 feet per year in the sawmill. The stock will be red and white pine and spruce. Negotiations are now under way for the purchase of the machinery for the plant.

A fire which took place on January 13th caused serious damage to a number of woodworking and show-case manufacturing plants at 15 Fisher street, Toronto. The total damage was about \$60,000. The building was occupied by John W. Woolnough, show-case manufacturer; W. C. Peters, wood-turner; John W. Smith, wood-turner, and Parker Bros., novelty manufacturers. A few piles of lumber in the yard were also destroyed, and the office building belonging to Mr. Geo. G. Miles was slightly scorched. The adjoining buildings of the Toronto Woodworking Company, the E. R. Burns Saw Company and Rankin & Company, excelsior manufacturers, were also scorched. During the progress of this fire the death occurred of Mr. G. G. Miles from heart failure as reported elsewhere in this issue.

Eastern Canada

The sawmill belonging to W. Bleu at St. Zotique, P.Q., was recently destroyed by fire, the loss being \$15,000.

G. R. Marshall will install an excelsior plant at Stewiacke, N.S., in the early spring and will require to buy between 600 and 800 cords of poplar wood.

The Argenteuil Lumber Company, Limited, Morin Heights, P.Q., who recently lost their mill by fire have commenced the erection of an up-to-date sawmill. The equipment will include a steam log loader, nigger, gun-shot

feed, 8 ft. double cutting band saw, re-saw, double edger, slashers and trimmers. The company are also putting in machines for manufacturing clapboards and shingles, as well as planing machines. The plant will be completed and ready to operate by the first of May. The company report a fairly good season for logging. They are taking out 3,000,000 feet, chiefly spruce.

The sawmill and furniture factory of the Valliere Furniture Company, corner of St. Roch and Valliere streets, Quebec, P.Q., were recently destroyed by fire, the loss being estimated at \$100,000.

Fauteux, Limitee, has been incorporated with a capital of \$99,000, with head office at Verdun, Que., to carry on business as lumber merchants. The provisional directors are J. O. Fauteux, merchant, and H. Fauteux, builder, both of Verdun, Que.

J. H. Allard, Limited, have been incorporated, with head office at L'Epiphanie, P.Q., and capital stock of \$50,000, to carry on a general lumber business, with power to operate sawmills, planing mills, etc. J. H. Allard, Geo. Duford and J. E. Mageau, all of L'Epiphanie, are interested in the company.

The Fraser-Brook Lumber Company, Limited, has been incorporated with a capital of \$99,000, with head office at Fraserville, Que., to carry on business as lumber merchants and pulp manufacturers. The provisional directors are J. Langlais, advocate; J. E. Pineau and A. Lemieux, merchants, all of Fraserville, Que.; B. Frechette, timber merchant, St. Honore, and J. H. Rousseau, notary, of Trois-Pistoles, Que.

Two timber limits, one situated at Callieres South, seventeen miles, and the other Callieres North, twenty-eight and a half square miles, both located at Port aux Quilles, County of Charlevoix, were put up at auction in the offices of Messrs. La Rue & Trudel, accountants, yesterday morning, but were withdrawn from sale, the highest price offered for the limits being \$6,050. The limits in question, which include saw mill, equipped with machinery and 132 acres, more or less, freehold land, are the property of Mr. Herman Young, who it is understood, refused an offer of \$40,000 for them last year.

Good progress is reported in connection with the construction of the large plant of the St. Lawrence Pulp & Lumber Corporation, at Pabos Mills, P.Q., which when finished will represent an investment of close to a million dollars. There is an irregular group of buildings, mostly one-storey and measuring something like 900 by 200 ft. in plan, forming a complete pulp mill for making high grade bleached sulphite pulp, together with a digester building covering digesters reaching 160 ft. above the ground. All of this is now being built by the Aberthaw Construction Company of Boston, and is to be finished by next September. The buildings have concrete exterior, the interior structure being largely of structural steel with yellow pine roofs. There is to be an independent steam turbo-generator plant—giving power for both the pulp mill and a saw mill which is being erected separately. A private railroad is to supply the mill with logs from the extensive timber and pulp wood limits of the company, aggregating some 500 square miles. The Dominion Government has undertaken to develop a harbor for safe wharfage for ships up to 6,000 tons burden.

Western Canada

The Raymond-Comrie Lumber Company, Limited, has been incorporated with a capital of \$10,000, with head office at Saskatoon, Sask.

Baker and Pringle, Limited, have been incorporated with a capital of \$20,000, with head office at Collingwood East, B.C., to carry on business as lumber merchants.

W. E. Koch, who has a mill on the Slocan River, not far from Nelson, B.C., has completed a dam and timber flume, which cost about \$25,000. Logs are now being delivered.

The Ardley Lumber and Shingle Company, Limited, has been incorporated with a capital of \$15,000, with head office at Vancouver, B.C., to carry on business as manufacturers of lumber, shingles, etc.

J. Fyfe-Smith Company, Limited, has been incorporated with a capital of \$200,000, with head office at Vancouver, B.C., to acquire the business of J. Fyfe-Smith & Company, and carry on business as lumber merchants.

MacConnell Lumber Company, Limited, has been incorporated with a capital of \$50,000, with head office at Vancouver, B.C., to take over as a going concern the business of MacConnell & Company, and carry on business as lumber merchants.

Superior Sash and Door Company, Limited, has been incorporated with a capital of \$60,000, with head office at Vancouver, B.C., to acquire the business of J. E. Dougherty, New Westminster, B.C., and to carry on business as lumber manufacturers.

Contracts have been awarded by the city of Winnipeg to Benjamin Richardson & Company, Winnipeg, for 3,030 telephone poles at \$3,371 and to O'Brien, Fowler & McDougall Bros., Union Bank Bldg., Ottawa, Ont., for 100,000 No. 1 ties at 58c and 150,000 No. 2 ties at 52c.

A contract has been entered into between H. C. Struchen, of Minneapolis, and the city of Prince Albert, Sask., whereby the former will erect a pulp and paper mill on a free site of ten acres provided by the city. The latter is also to furnish Mr. Struchen with power from La Colle Falls at special rates on the understanding that the plant will be ready for operation by the time the power is developed. The city is to notify Mr. Struchen one year in advance of the date at which it will be ready to deliver power.

Mr. J. C. Shields, 212 Winch Building, Vancouver, B.C., recently purchased timber berth 554 on Spuzzum Creek, B.C., and is now making plans for operating the property. The berth includes several blocks of timber aggregating 4428.8 acres adjacent to holdings which he acquired previously in the same valley. The land is well timbered with fir and cedar of the coast type and the price paid was \$13,083, the upset price. The reason the berth went at the upset price was that there were no other interests already located in the valley. The purchase of this timber will enable Mr. Shields to operate on quite a large scale. If his present plans are carried out, Mr. Shields will install small portable mills at different places up the valley and flume the rough lumber and shingle bolts out to a finishing mill to be located on the C. P. R., on the east side of the Fraser River. The Canadian Northern Pacific Railway runs on the opposite side of the river and as the distance across is short at this point, it is expected that an overhead cable system could be used to advantage to transport lumber and shingles across to the C. N. R. Mr. Shields will commence his operations as soon as lumber market conditions warrant. The limits contain, it is estimated, sufficient timber to supply a mill of 75,000 feet daily capacity for over twenty-five years.

Lumber Wanted

Already sawn or to be sawn

Cuts of 1" and 2" Hemlock
Cuts of 1" and 2" Spruce
5/8" Cull Spruce or Norway
5/8" Merchantable Spruce

There is Big Money Cutting Cordwood

The Features of Kent's Cordwood Splitter

- 1 Conveyor of logs to saw.
- 2 Steam hold down.
- 3 Cut-off saw.
- 4 Conveyor from saw to splitter.
- 5 } Steam piston.
- 6 }
- 7 Steam head block.
- 8 Can be used as friction drive to carry wood out.
- 9 Vertical splitter.
- 10 Adjustable horizontal splitter.
- 11 Delivery table.

The new Kent Cordwood Splitter will turn small and rough timber, from which all logs suitable for lumber have been taken, into valuable cordwood. It will add millions of dollars to Canada's cut-over limits.

If you own or hold permits for any hardwood timber limits the Kent Cordwood Splitter can make big money for you. The machine is economical to operate and cheap to install.

The capacity of this invention has been demonstrated as 42 cords of 4 ft. cordwood per day of 10 hours with 11 men and one team. That means the timber cut, split and piled.

The cost of splitting hardwood has been reduced over 50 per cent. by this invention aside from the utilizing of timber that would be useless for any other purpose.

*This is an unusually interesting proposition—

Brake Your Load and Save Your Horses

Besides avoiding accidents and eliminating sand hilling this braking device can greatly reduce your hauling costs. Larger loads may be handled and fewer men employed.

Our catalogue fully explains

Ryther & Pringle Co.

Carthage, N. Y.

Barienger Braking Device for letting heavy loads down steep hill and mountain roads. Saves horses and expense of sand hilling.

GOODHUE BELTING

FACTORY TO YOUR MILL

TO the saw mill and woodworking industries we offer an unusually good belting value in our "Acme Waterproof." This belting is specially made from the best hides to run in wet places where only the best quality belt can "make good." If you require any belting you should enquire into the merits of "Goodhue Belts" then you will buy a "Goodhue."

According to the conditions under which a belt has to run we recommend "Extra," "Standard" or "Acme Waterproof"—each brand the best quality but each made for a different service.

Send for particulars and prices

J. L. GOODHUE CO., LIMITED, Danville, Quebec

GET 20 PER CENT. MORE LUMBER FROM YOUR LOGS

by using our

Patent Steel Band Mill and Carriage

Results from logs of given dimensions cut on Breeze, Denison & Co. pat. band mill.

Diam.	Log Length	Feet Lum.
8 in.	16 ft.	45
10	12	54
10	16	69
11	15	96
14	16	171

This result was attained by different users of our mills during the season of 1912. We can prove to your satisfaction that this mill will cut more lumber and superior lumber than any other Band or Circular Mill on the market.

Special features of Mill

Concrete foundation not necessary. Frame constructed with brace bolted to same timbers which support base of mill. This prevents any movement of mill foundation throwing mill arbors out of cross line. Supporting timbers attached to track which prevents variation in cutting of boards.

Roller Bearing Carriage

designed to do away with lost side motion which is quite necessary for successful work in double cutting bands.

Double Action Friction Set Works

working on thin steel disc, which can be successfully used in place of usual foot friction in receding knees. This cuts down weight in pinion shaft, therefore reducing momentum, so that it is beyond speed of setter to over set by rapid work. Carriage can be changed from high to low speed instantly and can be operated without passing saw more than six inches either way. Knee opening to 44 inches. Guide prevents any binding motion to the gip and will automatically raise when coming in contact with knot in timber. Guides adjustable when mill is running.

A Canadian Built Mill of superior manufacture.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

December 20th, 1912.

Are your horses of use to you?

This seems an absurd question—and the answer is always
"Of course they are"—In which case provide your stables with:

Johnson's Reliable Veterinary Remedies

Johnson's Horse Liniment, No. 1 (Alcoholic)

1 gal. jugs (Imperial)	\$4.50 gal.
1 lb. bottles	8.00 doz.
2 lb. bottles	15.00 doz.

Johnson's Horse Liniment, No. 2 (an oil liniment)

1 gal. jugs (Imperial)	3.00 gal.
1 lb. bottles	8.00 doz.
2 lb. bottles	11.00 doz.

Johnson's Horse Colic Remedy

A sure and speedy cure for all kinds of Colic	
1 gal. jugs (Imperial) 40 doses	5.00 gal.
1 lb. bottles 4 doses	8.00 doz.
2 lb. bottles 8 doses	15.00 doz.

Johnson's Veterinary Healing Ointment (Gall Cure)

2 lb. tins	2.00 per tin
4 oz. tins	3.50 doz.

Johnson's Condition Powders (Concentrated)

1 lb. Packages	3.60 per doz.
----------------	---------------

Johnson's Camp and Household Remedies, such as Cough Syrup, Healing Ointment, Headache Powders, Big 4 Liniment, Stomach Bitters, Cathartic Pills, etc., etc., have stood the test of twenty-five years and are in use all over Canada, from the Atlantic to the Pacific. Prices are lower than those of all other manufacturers. Letter orders receive prompt attention.

A. H. Johnson, Wholesale Druggist, Collingwood, Ont.

Good Lumber HORSES

Should be free from all blemishes

Use

ABSORBINE

for Wind Puff,
Capped Elbow,
Bog Spavin,
Thoroughpin,
Shoe Boil,
Curb, Enlarged
Glands and all
puffs and swell-
ings, Fistula,
Poll Evil,
Sprains, Con-
tracted Ten-
dons, Bruises,
Lameness of
all kinds.

ANTISEPTIC

You cannot get good work out of your lumber horses if they are lame, blemished, sore, sick or similarly unfit.

The animal with Swellings, Soft Bunches, Bog Spavins or any such blemish, whether lame or not, needs your attention.

ABSORBINE

is your own best friend—it relieves the horse of all pain, soreness and troublesome blemish. It makes the horse better looking, better working, more fit and of greater value to you.

You can work your horse at the same time. This is no new lotion but the tried and tested remedy of many years successful use.

Thousands upon thousands of horses which would have been ailing and sick and unsightly have been made fit and well—good workers and good lookers.

What others have done with Absorbine you can do, too. All enquiries on special cases answered without delay—full information and instruction on request.

Absorbine \$2.00 a bottle at druggists or delivered.

Manufactured only by

ABSORBINE

does not blister or remove the hair, never leaves scars or blemishes of any kind.

It is easy to apply and does not require the horse to be laid up.

Highly concentrated and only a few drops required at each application.

Radcliff Solid Tooth Saws

MADE by men who have made a special study of saw construction and steel tempering.

The steel in Radcliff saws is specially tempered to maintain a keen edge and high tension. It is sufficiently pliable to avoid breakage, yet rigid enough to be economical in effort.

Write for our catalogue of solid and inserted tooth saws, mill supplies, etc.

Radcliff Saw Mfg.

Toronto

The Shimer "Limited" Cutter Heads, Figures 627 and 628 with Expansion

Why You Should Use The Shimer Cutter Heads

For Flooring, Ceiling, Siding, Ship Lap, Jointing, Double Ceiling, Doors, Sash, Blinds, etc.

Made of Steel Forgings, they represent the greatest possible strength in compact and workmanlike manner, embodying the vital principles of clearance to all leading Bit Points. The alternate and shearing effect of the cut reduces to a minimum the tearing-out tendency of cross-grained lumber. Cutters have exact shape in their exterior circles, and uniform product is maintained indefinitely without extra trouble or expense.

Send for Catalogue and Pattern Book. Address

SAMUEL J. SHIMER & SONS, Galt, Ont., Can.

Annihilate Scale

Potato Scale will positively remove scale from your boiler tubes and can do no injury to your pipes or fittings. Feed water should be regularly treated with Potato Scale to prevent scale, pitting, grooving and honeycombing; it saves fuel and so treats the water that it absorbs more steam.

Send us a gallon of feed water which we will analyze and then mix a sample of potato scale to suit your conditions—this is a free trial, write us.

What I Can Do For The General Planing Mill

You don't have long runs on a few kinds of patterns, the kind that requires a "333" — your work is mostly short runs, different kinds, different sizes, different patterns—the kind that need me. Here's what I can do for you:

1. I will take care of all your matching and sizing up to 24" x 8".
2. I will do all your double surfacing up to my full rated width.
3. I will run all the flooring you need.
4. I will serve you as an inside moulder carrying formed cutters up to 1 1/4" projection.
5. I am readily accessible in every part, so that changes can be made quickly, easily and economically.
6. I have all the conveniences, all the time-saving adjustments and all the grade-raising value of the latest fast-feed matchers.
7. I have a mechanically perfect drive that makes every ounce of power count.
8. I run at a low operating cost, both for power consumed and upkeep expense.
9. I am medium in weight and size.
10. I am also medium in price, so that any mill can afford to put me in.
11. I am making money—big money—for hundreds of successful planing mill owners, men who, like you, are operating a general purpose mill.
12. I will do the same thing for you.
13. I invite you to write today—now—to my designers and builders.

Educational Talks On Leather Belting by the

GRATON & KNIGHT MFG. COMPANY
WORCESTER, MASSACHUSETTS

To attain maximum efficiency and economy in your plant it is absolutely essential to know all possible about belting.

Leather Belting correctly installed and properly cared for is the most efficient and economical transmission medium.

Yet it is a well known fact that belting receives very little attention for such an important factor. For this reason we intend to publish in this paper a series of educational talks on belting, its selection, its care, etc. They will be "straight from the shoulder" talks, plain, instructive and authoritative.

Our Engineering Department is at your service, consult it freely concerning your transmission problems.

Disston Planer Knives are Best

*Send for Descriptive Booklet on Machine Knives
Free on Request.*

**A Knife that will hold
its Cutting Edge the
Longest Possible Time**

Disston Hog Knives

- cannot be equalled because they are made of a special, oil tempered, tough Disston Crucible Steel, that will hold its edge—an absolute requisite with these knives owing to the severe work they are called upon to do.

The steel is the foundation upon which rests all subsequent work. We have manufactured our own steel for 59 years, which enables us to watch it closely and maintain a uniform high quality.

We make knives of either solid or laid steel, as desired. Our line is complete and we can fill any order you give us.

Reg. U. S. Pat. Off.

These Curves Show the Increased Pulling Power Produced by Cling-Surface

and as they were plotted by Robert Thurston Kent, M.E., you can know they are authoritative

Mr. Kent tested two new belts—one treated with Cling-Surface, and the other not. To make the test perfectly fair both belts were first driven side by side in a New Jersey factory. Then, by means of a testing frame built especially for the purpose, some weights, and a polished rigid pulley, the comparative tests indicated by these curves were made. The complete statement which Mr. Kent has prepared covering these tests is now printed in booklet form. If you

wish, as you should, to improve economy in and in connection with your belts, we will be pleased to mail you a copy. Cling-Surface stops slip; makes belts pliable, easy running, and long lived; waterproofs; and reduces friction. Cling-Surface is used all over the world with equal success—in the driest, wettest, hottest and coldest climates. Your order or inquiry will have our best and quickest attention. We quote f.o.b. Toronto.

Automatic Knife Grinder and Saw Gummer

This combination machine will be a valuable addition to your plant and will pay for itself in a short time.

This is one of the many Automatic Knife Grinders and Saw Sharpeners manufactured by us.

Write for our complete catalog—it is yours for the asking.

SAMUEL C. ROGERS & CO. 18 LOCK ST. BUFFALO, N. Y.

**Dixon's Graphite Wire Rope Grease**

Reduces the wear, and prevents the corrosion, which destroys wire rope.

The graphite penetrates to the innermost part of the cable, giving both internal and external lubrication. And it forms a rust-proof, acid-proof coating which protects the metal against corrosive action. Send for "Wire Rope Lubrication", No. 238.

The McFarlane-Neill Mfg. Co., Ltd., St. Mary's, N. B.

Forged Steel Socket Peaveys and Cant Hooks are acknowledged by leading lumbermen to be the lightest and strongest on the market.

Try our Steel Loading Blocks, Twitching Grips, Saw Wedges, Skidding Logs, Timber Carriers, Split Rock Maple Peavey and Cant Hook Handles, etc.

Catalogues furnished and prices quoted on application

The Steam Tension Band Mill

THE top guide on this mill, as well as the upper wheel, is operated by a steam cylinder.

This means that the guide can be moved up or down instantaneously, which in one day's work means quite a saving of time over the ordinary mill. This goes a long way towards paying for the mill by the end of a year.

But this is not all—with this steam operated guide it is just as easy to keep the guide close to the cut as it is to set it for certain size logs and keep it

there. This can be done without loss of time, and so by bringing the guide down close to the cut, vibration of the saw is done away with and the quality of the lumber is improved.

No form of tension yet devised is as easy on the saws as the steam tension—several of the users of this mill have run through an entire season without cracking a single saw.

These are some of the reasons why our steam tension band mill is the most economical mill to buy, and there are others which you will find in our catalogue.

When you are tuning up your mill this winter for next season's operations, remember that we can serve you promptly whatever your requirements may be.

Applied Knowledge

Application of knowledge, as opposed to its mere acquisition, is what counts in the world of practical affairs.

Our knowledge of timber is practical; it has been applied; it is being applied steadily; it is

Available for your use.

Bear that fact in mind whether you desire to buy or sell timber lands.

All the information gathered by a far reaching, ambitious organization, all the knowledge, the fruit of long experience, and the facilities we have created are at the service of our clients.

We serve you, not at a cost, but to your profit.

Logging Locomotives

Mikado Type Locomotive, Polson Logging Co.

The Mikado is a good type for heavy hauling, where runs are fairly long and high steaming capacity is needed. The locomotive illustrated traverses 30 degree curves, and can be used on rails weighing 45-50 pounds per yard. It is simple in construction, strongly built, and rides well on uneven tracks.

When in need of a logging locomotive, consult

The Baldwin Locomotive Works

Philadelphia, Pa., U. S. A.

**For Logging Operations**

OUR Logging and Industrial Locomotives are not mere engines from stock, but specially designed locomotives for logging use. They operate with a minimum of fuel consumption and can be relied upon to give steady service every day of the year. All parts are amply designed, lessening the possibility of breakage.

**Not altogether what we
say but what users say**

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs,
in calm weather, 30,000 in a head wind.

West & Peachey - Simcoe, Ont.

"WAKE UP"

Rip Van Winkle slept for twenty years while the world moved on.

Of course, Rip never did anything of the kind literally. Irving used him to typify a class of New Yorkers who were direct descendants of the founders of New Amsterdam, who never progressed and of whom he was very fond of making fun.

To us Rip Van Winkle typifies a-Behind-the-Timer. You will find him in every business and in every walk of life. You'll find him in the lumber business—but he never uses a 77 Model 5 unless he "wakes up"

The new book on Model 5 will prove to you that no other Planer and Matcher equipment is so quite up-to-date as the American.

Let us send you a copy of the book.

BAND RESAWS

Mershon Resaws Are Preferred

Saginaw Seven-Foot Band Resaw

Wm. B. Mershon & Co.,
Saginaw, Michigan.

Grayling, Michigan,
November 5th, 1913.

Gentlemen :

Replying to your favor of the 1st inst., beg to state that we have used your band resaws for the past twenty-five years, and are happy to say the longer we use them the better we like them.

We have had other re-saws built by other manufacturers but **have decided that the Mershon Resaw is the only one that will supply our wants.**

We cannot find language strong enough to express our feelings about your resaw.

Yours very truly,
Salling Hanson Company.

The Mark*of Quality*

Why Our Model "D" is Superior

A Steam Feed Valve that sticks, leaks, or kicks, has no place in a mill—minutes are too valuable for that—but there are several points in addition to these that are well worth considering, as exemplified in our Model "D" horizontal valve.

Horizontal, Double Ported Steam Feed Valve, Model "D."

First, being horizontal, the valve can be double ported, which means that twice the steam opening can be obtained with the same motion.

Second, the horizontal valves can be connected to the sawyer's lever with 25 per cent. less joints and toggles than vertical valves, cutting out a lot of lost motion.

Third, by using our double bell crank, operating through differential arcs, we get a **quick opening** at the steam end, combined with a **slow closing** at the exhaust end, with the one motion of the lever.

These points all combine to **save time where time is lost—in reversing the motion.**

The construction is simple, there is no stuffing box to retard easy motion, and the valve plugs, of hollow construction, are so light and of such large surface that they cannot wear appreciably in the life of the average mill.

Two minutes a day, for one season, will pay for a pair of these valves. Not a bad investment, eh?

Keep Your Filer Satisfied—

THE work your filer does is limited to a great extent by the equipment he uses.

See that you give him the kind that allows him to keep your saws in the best possible condition.

Smooth cutting, easy running saws mean smooth sawn lumber and good Filing Room Equipment is the secret of both.

COVEL SAW FILING EQUIPMENT

For Band and Circular Mills—Any Size

has the endorsement of the best, most up-to-date filers in this country.

Both in Canadian and American installations, where severe saw service is the general rule, COVEL Filing Room Equipment is giving results that are reflected directly in the well-sawn out-put of these mills. It is producing

better cuts of better lumber wherever used. *Your Filer needs that kind of equipment.*

We can supply COVEL Filing Room tools capable of handling circular saws up to 84" diameter, and bandsaws up to 20" wide, that will help him keep your saws in better shape at less cost than ever before.

Let us refer you to an installation near your mill where this is being done. Ask the Filer there what he thinks of COVEL Filing Room Equipment — Then write us for prices.

"FROST KING" METAL

Our thirty five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock this, write us and we will take pleasure in making you a shipment of a 25 lb. box.

\$5,000,000.00

worth of mixed metal

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 16-ft. Slash table. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 2 Lath Trimming Saws. | |
| | POWER PLANT |
| | 1 24 x 36 Slide Valve Engine with 40-in. x 12-ft. extra heavy double arm split fly wheel. |
| | 2 Double Duplex, high pressure Water Pumps. |
| | 5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam. |
| | 2 125 h.p. Water Wheels. |
| | 1 Upright Engine for sawdust conveyor. |
| | 1 10 h.p. Engine. |
| | 1 Mitts & Merrell Hog. |
| | 1 Wood Machine for 22-in. wood. |
| | 1 Wood Machine for 16-in. wood. |
| | 1 Edger for ripping dry lumber, installed. |
| | 1 Edger for ripping dry lumber, not installed. |
| | 1 30 h.p. Generator, 250 volt. |
| | 1 30 light arc generator. |

FILING ROOM

- 1 Automatic Filing Machine for 12-in. D.C. band saws.
- 1 Automatic Grinding Machine for 8-in. S.C. band saws.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and rails and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

C. Beck Mfg. Co., Limited, Penetanguishene, Ont.

**Long Service
and Satisfaction**

The operator, owner and consumer all derive profit and satisfaction from the Shimer Cutter Head. The operator is pleased because the Heads have a "make-ready" built into them which relieves him from the cares of "fitting and trying." The owner gets satisfaction out of the fact that the output is increased and the work raised in quality. The consumer gets material which goes into place with less labor and expense and presents a better appearance when finished.

Shimer Cutter Heads are made for the express purpose of helping mill men to do better work and to save time and labor—to relieve them from many of the annoyances which come up daily.

To this end they are provided with the Shearing or Shave Cut—the chip is divided by the upper and lower Bits—the Bits are set on the Heads so the diamond

The "Shimer Limited" with Expansion, price \$72.46 complete.

shaped point of the Bit leads in the cut, with a clearance to the cutting edges that effectually prevents friction.

Shimer Cutter Heads are easy to understand, are made strong throughout and have no delicate parts to get out of order, hence they give a lifetime of profitable service at low cost.

We want the desirable features of these tools to impress you in a practical way, hence our offer to send them on trial for 30 days.

Mail us measurements today.

"Defiance" Woodworking Machinery

Especially do we wish to call your attention to the rapid and accurate "Defiance"

NECKYOKE and SINGLETREE MACHINES

They are used by the largest manufacturers of this product, as well as the carriage and wagon manufacturers who realize the value of these special machines for the dependable product they wish to turn out.

These machines will accommodate material up to 5' in diameter and 48' long. They have superseded all other methods of producing neckyokes, singletrees, whiffletrees and doubletrees in all their shapes and sizes, always performing the work at an immense saving over any other method.

Further particulars and prices will be gladly furnished upon application. Write us AT ONCE.

The Defiance Machine Works, Defiance, Ohio, U.S.A.

Singletree Dressing and Pointing Machine.

Solid and Inserted Tooth Circular Saws

We make a specialty of these lines

We remake old Solid Tooth Saws into new Inserted Tooth Saws

Write to us for quotations.

Our saws have been before the public of Canada since 1855, and have won a reputation far exceeding any other make of saws, combining as they do so many points of marked superiority.

By the old method the tempering of circular saws was to a great extent a matter of chance.

By our Patent Process that uncertainty is entirely avoided.

Being tempered and straightened by heat and pressure in air-tight ovens at a uniform heat between heavy revolving plates, we produce a perfectly even temper throughout the plate, and being free from that uneven strain or tension caused by so much unequal hammering they are not so liable to buckle, which was a great source of trouble and expense in the old style of saw.

These saws will stand up to their work better under all circumstances, and being made of a higher quality steel than it is practical to use by the old method, they hold an edge longer and will do more work than any other saw on the market.

We are prepared to make prompt deliveries of all Saw Orders—Rush Orders by mail or wire receive immediate attention.

Don't Buy One of Our Steam Drag Saw Machines unless you want the best. The machine here shown has Positive Stroke; Friction Hoist; forged steel Connecting Rods and cast steel Crosshead. Is made in four sizes—from 26" to 54" stroke.

Write for Drag Saw Catalog fully describing this as well as other types.

ADAMS TOWING MACHINE

This machine installed in our pointer will do the work of a steam tug as well as many things a steam tug cannot do. The machine is strong and amply designed, burning coal-oil as fuel. Machine starts direct off coal-oil.

The pointer is particularly well built.

Ribs and frame are bolt fastened; they are made of well seasoned white oak, steam bent where necessary.

The planking is Louisiana Red Cypress.

Rubbing streaks are of hard maple.

The Adam's Pointer has proved a good investment for many lumbermen. Write for catalogue and testimonials.

Adams Launch & Engine Co.

Penetang, Ontario

The Steam Tension Band Mill

THE top guide on this mill, as well as the upper wheel, is operated by a steam cylinder.

This means that the guide can be moved up or down instantaneously, which in one day's work means quite a saving of time over the ordinary mill. This goes a long way towards paying for the mill by the end of a year.

But this is not all—with this steam operated guide it is just as easy to keep the guide close to the cut as it is to set it for certain size logs and keep it

there. This can be done without loss of time, and so by bringing the guide down close to the cut, vibration of the saw is done away with and the quality of the lumber is improved.

No form of tension yet devised is as easy on the saws as the steam tension—several of the users of this mill have run through an entire season without cracking a single saw.

These are some of the reasons why our steam tension band mill is the most economical mill to buy, and there are others which you will find in our catalogue.

When you are tuning up your mill this winter for next season's operations, remember that we can serve you promptly whatever your requirements may be.

Simonds Canada Saw Company, Limited

VANCOUVER, B. C.

MONTREAL, QUE.

ST. JOHN, N. B.

B.B.L. DOORS

In the manufacture of B. B. L. Doors only thoroughly well seasoned lumber is used.

Our plant is new and modern so that we are able to make prompt shipment on all orders.

Special prices quoted on large orders or shipments from stock.

We will be pleased to send you particulars and prices of B. B. L. sash, doors and trim.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, \$2.00 per year in advance; other foreign countries embraced in the General Postal Union, \$3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

No. 4

The C. L. A.'s Successful Annual

The most important meeting that the Canadian Lumbermen's Association has ever held was that which took place at Ottawa on February 3rd. There have been many criticisms directed against the Association in the past, the chief of which was to the effect that it was developing into an affair consisting solely of an annual meeting and a banquet, and that those who benefitted were the active members located at Ottawa, and not those who were located outside of that city. These were serious criticisms and could not be overlooked. The question was brought up, with his customary straight-forwardness by Gordon C. Edwards and was discussed by many of the members at the meeting. Those who heard the discussion were convinced unquestionably that these criticisms were not justified; that they were in fact the criticisms of people who had themselves to thank for not receiving greater benefits from the association. If the association was not active enough, or working along lines to suit some of its members, or even some outsiders, these men should themselves have got actively to work to remedy matters, instead of standing aloof and criticizing. This view was taken by all who spoke on the subject and they were so unanimous in their appreciation of the association and its work that the matter dropped at that point. Then the members went on to discuss their regular business affairs and it soon became apparent that, not a single manufacturer or wholesaler of lumber in Canada could afford to remain outside of the Canadian Lumbermen's Association, so long as he could scrape together the very moderate membership fee.

For several years the association has been passing through its formative stages. The struggle has been an up-hill one involving not only the regular organization work connected with any form of business activity in its early days, but also involving a fight against prejudice and lukewarmness which might have depressed and discouraged less determined men than those who have been responsible for the development of the association up to date.

The Canadian Lumbermen's Association has represented the lumbering industry during the few years of its existence in a very effective manner. It has fought the battles of the lumbering industry before the Board of Railway Commissioners and has met with considerable success in this direction. It has succeeded in bringing about a better relationship between the lumbermen and the railway interests, which may some day result in the removal of many of the annoying difficulties connected with lumber shipments. The association has brought together a lot of lumbermen who formerly knew little of one another, and has shown them how closely their mutual interests are connected. During the year which has just passed, the Canadian Lumbermen's Association has entered the field of actual business activities in a manner which promises to make it not only valuable to the lumberman, but indispensable. By taking up the creation of a credit rating service, the association has undertaken a work which promises to do more towards increasing its membership and spreading its influence than anything else which it has yet undertaken. In the face of considerable opposition and indifference this credit rating service has been worked up successfully. The value of such a system cannot be over-estimated. Lumbermen already pay a large amount annually, in many cases, for the lists of general credit rating agencies. If a list is prepared by lumbermen and kept up-to-date by men who are closely in touch with the lumbering industry, there is no question that the information which it furnishes will be many times more accurate and valuable than any other which is at present available. The manner in which this service has already been received and developed leads to a belief that, with the encouragement which it deserves, it will be developed into a great factor in the lumbering industry. That the Canadian Lumbermen's Association will establish itself firmly among lumbermen as a result of this service seems certain.

Another step which will probably be taken by the association this year, as a result of the discussions at the last meeting, will be the formation of a branch for the gathering of statistics of production, consumption, etc. It would be possible for the association to gather information of this nature and at the same time to secure information as to the probable operations of its members during approaching seasons. By such means a useful idea can be obtained, well in advance, of conditions which are likely to prevail in connection with trade.

In addition to these practical features, the recent annual meeting was as interesting and largely attended as any of its fore-runners. The members present took an active part in all the proceedings and made the discussions thoroughly practical and valuable. Many members brought their wives and families with them and the presence of the ladies at the banquet was a welcome innovation in the proceedings.

Taking into consideration the features above outlined, together with the enthusiasm of the members present, one is amply justified in asserting that this year's annual meeting marked a distinct step in the advance of the association towards the ideals which its founders had in view.

Credit Considerations of Great Importance

Greater attention is being given at present to the matter of credits in connection with the lumber business in Canada than has probably been given at any previous time. When one considers the trade conditions prevailing to-day and those which have prevailed during the last year, it is not surprising that this should be the case. For a period of several years prior to the summer of 1913, the lumber trade was unusually prosperous in nearly every part of Canada, and credit was extended much beyond the limits of caution. Only the strong position of the country from an industrial point of view saved it from more serious results arising out of this credit extension during the last few months. Now that the corner has been turned, those who were worried about their credits—and this includes practically everybody in business to-day—have commenced to consider the best means of preventing the recurrence of a similar trouble.

At the bottom of the whole situation lies a factor over which we have not so great control in Canada as they have in older countries.

Our business to-day is done very largely upon credit, and when trade becomes depressed it is always a difficult matter to draw in the credit lines. For the same reason it is a matter of greater difficulty in Canada, than it is older countries, to prevent the extension of credit beyond safe lines. The country must be built up and developed and the only way to do it is to make use of the capital from other countries which is available for such purposes. From the large manufacturing and constructing companies, therefore, down to the smallest concerns engaged in supplying building material, borrowed money is circulating freely in times of active business, and in times of depression the circulation of this money is interfered with and those who are dependent upon it for the life of their business find themselves in trouble.

The experiences of the past all point strongly to the wisdom of holding, in front of every kind of business, particularly such businesses as the manufacturing, buying and selling of lumber, a trade ideal carried on as closely as possible upon cash basis. This is almost impossible in connection with the lumber manufacturing business in which it some times takes a matter of several years to turn the raw material over into the hands of the consumer in the form of a manufactured article. But, in connection with the wholesale and retail lumber trades there is room for a much closer approximation to the cash business than has been obtained in the past. The nearer one comes to the ultimate consumer of lumber, the more desirable and feasible does this ideal become. Wholesalers really are obliged to act as bankers for both manufacturers and retailers in many cases, but retailers are in a better position. In the past they have too frequently considered themselves in the light of bankers for their consumers. Many retailers to-day, are talking about the wisdom of a cash business, who formerly would have considered such a proposal impossible. It is a sign of the times, which may only be a temporary result of the recent depression, but we believe that it is more than this; that it is an indication of a gradual change which is coming over the face of the retail lumber trade. Retailers who used to do business almost entirely upon a credit basis, feeling that they were obliged to do so in order to keep that portion of their trade which was profitable, commenced a few months, or years ago, to educate their customers to paying cash. The remarkable thing about it is how much easier they have found the change than they had anticipated, and how much more profitable it has been than was expected.

This matter has been discussed with the Canada Lumberman by nearly every retailer whom it has recently visited, or with whom it has corresponded and all of them have been of one opinion, that they should have tried this plan long ago. There may be localities in which

the change would be a much more difficult matter than in others, but it is safe to say that the retailer has a right to the interest upon the money which a customer owes him and that the interest should be the current bank rate. If this fact were given its proper importance by dealers and customers, the whole credit business would solve itself. In charging the bank rate of interest after the due date of the bill, retailers are only doing what is businesslike and fair. Moreover, they are doing a service to trade in general, by keeping it within its proper channels and by doing their share in solving the problem of maintaining the circulation of money.

With the wholesaler the problem is more in the nature of watching carefully the class of firms and dealers to whom credit is given. Any man can go out upon the road and take orders for lumber, but to take orders for which money will be paid without unreasonable delay, is quite another matter. One hears many discussions about the mistakes made by different firms in granting credit where it is not deserved. There is a certain class of businessmen in every country to whom credit should not be extended. Most of such men are known individually to those wholesalers who are successful, and any business done with them, by such firms, is on a cash business. Other wholesalers, however, will send out men upon the road and accept orders taken from such firms, without any hesitation; shipping to them, stock for which there is grave doubt about their ever receiving anything in payment, except perhaps a certain amount upon the dollar when an assignment has been made.

The move which the Canadian Lumbermen's Association has recently taken in the direction of establishing a credit rating service, which will make information available upon the standing of different firms, gives promise of splendid results. It has been worked out with great success in other countries. It has done no harm to any one, but a great deal of good to nearly all. It obliges those who are inclined to purchase too rapidly, to go on a more conservative basis. It warns those who are too free with their credit against most of the danger spots. It has a regulating and controlling influence which cannot be over-estimated. The growth of such a scheme will do more towards placing trade upon a safe basis than anything else. The formation of a general credit service of this sort, will also direct the attention of individuals more definitely towards the importance of systematizing their own credit business, and will, in this way, encourage the development, in individual offices, of what ought to be effective credit rating services for individual use, based upon the results of business experience.

Yellow Pine in Trouble at Home

Much of the criticism which has recently been directed against the use of yellow pine in Canada has been focussed upon the lack of durability in short leaf timbers. Some of the criticism has carried this same complaint against the long leaf variety, but the latter finds many defenders who deny the charge. Dry rot in short and loblolly pine has lately come strongly into the limelight, both in the United States and Canada and the charge is openly made that these timbers will not withstand the attack of this fungus. Recently the matter took on an altogether different appearance, however, in the Eastern States. To understand the latest development one must know that the New England factory mutual insurance companies developed, many years ago, what is known as the slow burning frame mill construction. This has done much to enable wood to hold its place in competition with steel and concrete. A new expert in the employ of the same insurance companies has now come to the front with a statement which has set the long leaf yellow pine trade by the ears. The sum of his criticisms is that hard pine of the old durable variety is now out of the market and that sufficient to build a factory cannot be obtained in the sizes required, at a price competitive with other materials. He concludes that the resin percentage is the index of durability, and, examining timbers for which (according to his statement) \$59 a thousand feet was recently paid, he finds them deficient in certain parts. Reducing them to such sizes as will show 5 per cent. of resin through-

out, he obtains a cost price of \$115 a thousand feet, and offers some quotations that appear to indicate that this is a reasonable price conclusion.

All this would be great news for the manufacturers of hemlock, spruce and red pine in Canada who have found yellow pine such a serious competitor, but it would be unwise to put too much faith in this criticism. Without wishing to take one side or the other in this dispute, but simply to present the case as it appears to an American Trade Journal, so as to acquaint our readers with the details of this interesting development, we present the following quotations from the latest issue of the American Lumberman:

"The facts of the matter are that as good long leaf timbers as those used years ago, and whose durability is admitted, can be laid down in any desired quantity in the average New England town, of the prime quality requiring two-thirds heart to show, at \$40 to \$45 a thousand feet, in sizes up to 20 x 20, 24 feet long, or larger than the average requirement; and 12 x 12 about \$6 less, intermediate sizes in proportion. The engineers and architects have not been obtaining timbers of this kind because they have not insisted upon them. Short leaf and loblolly timbers in large quantity find their natural market in New England, and have ample strength and durability factors for many purposes. But factory engineers need not accept them in place of longleaf where longleaf is needed, in textile and other factories

where temperatures of 80 degrees, and a humidity approaching saturation, are constantly maintained—ideal cultural conditions for the dry rot fungus.

"At the same time it is very unfortunate for the manufacturers of such structural timbers that they should have gone into a use for which they are not fitted. Laxity of purchasing inspection may react in such a way that the manufacturer of the durable kind of timbers may find it necessary hereafter to brand his product, and stand back of the brand, but even this will not cure all the harm that has been done. The substitute game has gotten another boost; and if there are any lumber manufacturers who have crowded in material for this use which they knew did not conform to the specification and would not endure the severe test of durability involved they were the ones who did the boosting. The fact that they were allowed to do this only because the purchaser, through carelessness or inexperience, left the door open to them through lax inspection is hardly a sufficient excuse.

"Perhaps, some day, architects and engineers will be able to protect their clients, and therefore the lumbermen, against such unfortunate happenings; but this somewhat remarkable report, does not point strongly in that direction. It is quite likely that the resin in wood has something to do with its resistance to some forms at least of fungus; but anyone who has ever studied a cross-section of longleaf yellow pine will recall the small and isolated resin ducts, which may amount to 5 per cent. or more in area but are distinctly separate from the other 95 per cent. of open-celled structure. If the antiseptic action of resin is due chiefly to its waterproofing quality it is difficult to see how the resin segregated in these ducts can protect the rest of the wood structure in which only traces of it may be found."

All the above points to the fact that Canadians have not been the only ones to suffer by reason of the use of a very poor grade of short-leaf pine, in competition with timbers of a much greater intrinsic merit.

A Factor in Decline of the Waney Pine Trade

Many reasons have been given for the decrease in the export trade of Canada with Great Britain, in waney pine, which has been so noticeable of late years. Most of the reasons are fairly well understood by those who are interested, being chiefly the rising price of Canadian white pine on account of its increasing scarcity, the growing demand for Canadian white pine in the United States, the competition of Russian and Swedish woods and also the competition of yellow pine from the United States. Another cause has apparently grown out of the combination of causes already mentioned. Consumers in the Old Country have been gradually educated into a belief that Canadian waney pine is practically unobtainable and have given up asking for it. The Timber Trades Journal of London, England, discussing this situation in a recent issue says:—

The advance that has taken place in the price of the high qualities of Quebec waney pine during recent years has had the effect of putting it very much out of the market for general purposes and for house-building. Russian and Swedish woods have been substituted, while the shipbuilders have taken pitch pine largely for their work. This condition has gone on for some years, and the impression now prevails that waney pine is practically unobtainable. This idea is altogether

erroneous, as although the growing timber may be further removed from points of transit, unquestionably there is still a very considerable supply to be drawn from. In addition to this, there is, we believe, at the present time a larger stock of this wood in Britain, particularly on the Clyde, than has been the case for some years. The quality and specification are undoubtedly better than they were, and the timber can be had at a less price than it realised some years ago. This also applies to the timber "on the other side" which will be shipped to this market. There is no doubt about the superiority of Quebec waney pine over pitch pine for both appearance and durability in the case of decks for high-class river, channel and ocean-going steamers. We venture to think that only under the mistaken belief that Canadian pine could not be got, have the designers, owners, or builders of a steamer like the largest and finest Cunard liner "Aquitania" been influenced to have the promenade deck especially laid with pitch pine instead of Quebec pine. Where effect is desired in keeping with the other fittings of fine vessels it can be had at comparatively little extra cost by using the Quebec pine in place of pitch pine. We point this out so that designers and builders of passenger vessels may be guided in the future, and in this connection a field for the exercise of its characteristic enterprise here presents itself to the trade."

Editorial Short Lengths for Busy Readers

Many new enterprises, both in mills and logging camps, were announced in British Columbia early in 1913, contingent on the good times, but most of these have been postponed. It is very probable they will be proceeded with in the future. Two or three large propositions are in view. The Empire Lumber Company, of New York, is going ahead with its mill at Crofton, east coast of Vancouver Island; it has extensive limits at Cowichan Lake, fourteen miles inland. Thomas White and W. H. White, of Boyne City, Michigan, and W. O. King, of Chicago, who own limits at the head of Vancouver Island, propose to go into saw milling on a large scale. In the northern part of the province, a company of Montreal capitalists, including Hon. W. C. Edwards, Alexander Maclaren, George B. Pike and E. J. Chamberlain, the latter manager of the Grand Trunk Pacific, will erect a mill at Dowe creek, on the upper Fraser, when conditions are favorable.

Figures for the year, although not complete, show that log production of British Columbia for 1913 was about the same as in 1912. January 1 a year ago a change was made in the districts. Prior to that all the Coast was in one district. Now the district that reports to the timber inspector in Vancouver is less in extent, other reports going to Victoria. In the Vancouver district there was an increase of about 16,000,000 feet in the cut of timber last year. With a reduction elsewhere this amount will about offset the difference, so that for the province as a whole the cut is about the same as in the year pre-

vious. There is this difference, however. A year ago the log surplus amounted to about 200,000,000 feet. This year it is about 3,000,000 feet. On the other hand stocks in the yards are smaller than a year ago. Eighty per cent. of the logging camps are reported by the timber inspector to be shut down, but it is expected they will be in operation again the latter part of January or the first part of February. The same applies to the mills on the coast. Although normal conditions will not resume suddenly it is expected that within six months there will be a good general business.

An important and interesting judgment has recently been given by the Judicial Committee of the Privy Council in the case of David McLaren vs. the Attorney-General of Quebec. David McLaren is the owner of land on both sides of the Gatineau river at a point where there is a 40 ft. fall. In 1899 the provincial government granted water power rights at that point to Wm. and Edwin Hanson. Mr. McLaren brought suit to have this grant set aside, maintaining that, as riparian proprietor, he had rights to the bed of the river. The Attorney-General intervened to uphold the grant. In 1909 Mr. McLaren secured judgment in his favor in the Supreme court at Hull. An appeal was brought by the Attorney-General to the court of Kings Bench and the Superior Court judgment was reversed. Mr. McLaren took the case then to the Supreme Court, where the judges divided evenly, thus leaving the judgment of the Court of Kings Bench in effect. Mr. McLaren took the case on to the Privy Council which has now decided in his favor.

Sixth Annual of C.L.A. a Great Success

Most Important Meeting in History of the Association—Credit Rating Service to be Developed—Senator George Gordon the New President

The sixth annual meeting of the Canadian Lumbermen's Association was held at Ottawa on February 3rd and was easily the most successful and important of all the annual meetings which the Association has held. There was a good attendance. After the routine business in connection with the opening of the meeting had been disposed of, the president, Mr. Alexander MacLaurin, delivered his address. After referring to the chief events of the year 1913, which had influenced financial conditions, the president said that while business at the present time was on a very restricted scale, perhaps they had been galloping along at too fast a pace and using up their natural resources in an extravagant manner. He could see nothing in the future to create discouragement. Money for legitimate use would, he felt, be comparatively cheap. He saw no necessity for slaughtering prices. Prudence, economy and co-operation were the lines which he recommended for adoption. The Canadian Lumbermen's Association was undoubtedly of great value to the trade in Canada. He urged upon the members to co-operate more extensively with the secretary and to make more frequent use of the Association and its services.

The recent removal of the duty upon lumber entering the United States had not resulted in the "swamping" of United States markets by Canadian lumber, as had been so generally predicted. Whether or not the ultimate consumer in the United States got the advantage of this abolition of duty was of no concern to Canadians, where the business was on the basis of a price f.o.b. at the point of shipment.

Speaking of Southern pine and its use in Canada, Mr. MacLaurin quoted from the remarks of president Corwin at the semi-annual meeting of the N. C. Pine Association, held recently at Charlestown, S.C. Making comparisons, running over a 20-year period, the following results were shown. In 1893 the timber yielded 55 per cent. of firsts and seconds and 45 per cent. in lower grades, and the average price realized was \$13.25 per M. feet. The cost of operating in '93 was considerably less than the present time. The old growth timber was then conveniently located for both rail and water transportation. To-day the lumber was further removed, sappy and inferior in grade. It is in small lots scattered here and there and largely of second growth. The cost of rail-roading has increased since 1893, and the increase is all the way from \$3.00 to \$6.00 per M., labor is more than double and the grades of No. 1 and 2 have dropped from 55 per cent. in 1893 to 18.6 per cent. in 1912 with 81.4 per cent. of grades below Nos. 1 and 2, as compared with 45 per cent. in 1893. The price realized in 1912, taking all these things into consideration is \$4.42 per M. less than in 1893, and Mr. Corwin was of the opinion that the 1913 prices would show a still further decline of from \$2.00 to \$2.50 per M. How long our friends to the South would continue quoting ruinous prices for southern pine in order to get business, is for them to say.

Undoubtedly, in many instances, this southern pine was used for purposes for which it was quite unfit. Owing to its inflammability, other woods of Canadian growth would be more desirable. The lumbermen had much to do to educate people in the use of the right kind of lumber. Their efforts should be concentrated upon the various

associations of architects, with a view to persuading them to specify Canadian grown lumber wherever possible. A great deal of southern pine was being used in the construction of cars, not only for sills, but for lining of box cars, etc. Canadian spruce or pine would be preferable for the last-named purpose, from a fire point of view.

Mr. MacLaurin suggested that the Association should organize a department of statistics. If they could get all lumber mills to report to the secretary what their actual cut had been during the sawing season and what their probable cut in the woods would be, the information would be of great value.

Speaking of the Panama Canal, Mr. MacLaurin said that it would not create a demand for a single foot of lumber that did not already exist. It might result in disturbing the various sources of supply and demand, but in his opinion conditions would right themselves and natural sources would find their natural markets. He believed also that the 10 per cent. additional duty on all articles entering the United States in foreign vessels would only amount to an extra burden to the American consumer, and would not be of any practical benefit.

The secretary's report dealt in an interesting manner with a number of the important developments which have taken place recently in the lumber business. The following interesting comparison was made of the trade in lumber in Canada and in the United States.

The total estimated lumber production of the United States for the calendar year 1912 was practically 44,500,000,000 ft. b.m. The reported Canadian production for 1912 was 4,389,723,000 ft. practically 10 per cent. of the cut of the United States.

Attention was called to the Australian trade in timber, lumber, etc. That country imported during 1912 453,778,175 sup. ft. of a value of \$13,390,187. Of this amount the United States sold them in quantity 57.8 per cent., while Canada only furnished 4.2 per cent. A comparison of the average prices obtained is also to the disadvantage of Canada, viz., Canada, \$18.36; United States, \$23.95; or an average better price paid to the United States of \$5.59 per M. ft.

Workmen's Compensation Act a Menace

The most important part of the Secretary's report was a reference to the proposed bill for the compensation of injured workmen which is now under consideration by the Government of Ontario. "It is not saying too much" said the report, "to describe this bill as tyrannous, unjust and peculiarly dangerous to the State." The objections taken to the proposed bill by the secretary came under the following heads:

- (a) It abolishes common law rights.
- (b) It vests arbitrary powers in an appointed commission from which there is no appeal.
- (c) It imposes upon the employer the obligation of paying to the injured employee as long as he lives, a sum not exceeding 55 per cent. of the wages paid him at the time of the injury. This payment may be commuted at the discretion of the commission, to a lump sum payment.
- (d) It provides a similar payment to be made to the widow in

The New President—Senator Geo. Gordon.

Gordon C. Edwards—Director.

The Retiring President—Alex. MacLaurin.

the event of the workman's death, for the rest of her life, or until she marries again.

(e) It eliminates all consideration of the point whether the injury was caused through the fault of the employee himself. A workman may deliberately injure himself and collect compensation from the employer. Two workmen may have a quarrel and one may injure or kill the other during working hours. The employer must pay any award made by the commission, not exceeding 55 per cent. of the injured man's wages.

(f) It puts employer and employee in bitter antagonism to each other and is based on the assumption that the employer is the avowed enemy of the working man.

(g) It is the most glaring example of class legislation with which any community has ever been threatened. For instance railways and other companies are exempt from its provisions.

In addition to these objections, a serious matter was the fact that the accident fund would be all provided by the employers. The employees would provide nothing. The government would contribute only towards maintenance of the commission.

No one would deny that a working man injured by accident to which the employer had not contributed, was entitled, not only to every care and consideration but to compensation—generous compensation and humane sympathy. But this should be at the expense of the State and not of the employer. The individual who deliberately injured himself or courted injury by foolish and dangerous practices should not be considered to the same extent.

Because a man was the victim of accident to which the employer had not contributed, why should the employer be compelled to pay the workman an income for the rest of his life?

This bill concerned only the province of Ontario, but if it were passed, unquestionably the labor party would seek the passage of similar acts in other provinces.

Instead of having a provincial law, it had been suggested that the whole case was one for federal action. This would mean a universal indemnity fund provided and operated under a Dominion Act.

Whatever was done, the proposed bill, now before the Legislature of Ontario should be killed before it became law.

The report of the treasurer, which was then presented, showed that the financial affairs of the Association were in a satisfactory state.

The executive committee in its report said:

Credit Rating Service Growing

During the year we have had application for credit rating reports on 119 firms, and we believe that this branch of our work is most valuable, and can be made more valuable by sympathetic and prompt replies giving information when asked. A number of our members have been most generous in this respect during the year, and their reports and advice have been much appreciated. There is much ground to be covered, therefore, if the full benefit of this branch of our work is to be derived. Permit a comparison with the National Hardwood Lumber Association on the other side of the line. Their bureau was only started during the year ending June, 1913, and reporting at that time they had over 500 reports on file, and it was said in the President's address that those who have used the department are enthusiastic in their praise of its value. Up to that time no extra charge had been made, but it was felt that to perfect the work and render it more

efficient it might be necessary to make a slight charge for the reports. Since the beginning of the present year we have asked all firms who have hitherto been reported upon to give a statement of their affairs to December 31st, 1913. A considerable number of these have been given to us, and others have said that their fiscal years did not terminate until a little later when they would be glad to furnish a full statement.

One of our members has requested that our reports should be made on a sheet of paper of uniform size so that they could be filed properly. We appreciate the importance of this, but inasmuch as no extra charge has been made for these reports, and no extraordinary appropriation made to get the detail in the hands of our members, we have not felt justified in going to additional expense. Perhaps, now that the late reports are being made by those inquired about, we may be able to make a complete revision of the reports and have them printed in pamphlet form.

We have handled a number of claims during the year for our members, and in all cases, excepting where a man was an absolute bankrupt, we have collected the money. The collection also of railway claims for overcharge is one of our departments, and we invite our members to make use of this branch. We have collected hundreds of dollars, and all it has cost the members was postage on their letters to us. Whilst on this subject, we would urge upon our members in extending credit, that they be guided by the reports before them. Of course the anxiety to sell particularly if the price is attractive, is a great temptation to view trade reports more favorably than the circumstances justify. The tendency too, in a number of cases where the market goes against a man is to either repudiate shipment or make unjust deductions. Terms and conditions should be very clearly specified and insisted upon. In this way misunderstanding would be avoided.

During the year we sent out a circular to our members calling attention to the fact that we were threatened with an increase in fire insurance rates unless means could be found whereby the enormous fire waste could be reduced. It is said on competent authority, that the average loss ratio on saw mills and lumber yards for the past few years has amounted to not less than 80 per cent. of the premiums. We believe as a direct result of the efforts put forth in this direction that there has been an investigation of conditions by the insured and in some cases a general clean up. We understand that several saw mills have had under contemplation the installing of sprinkler systems for the protection of their property. Let us emphasize this point and have a thorough over-hauling and clean up before starting business next spring. It may interest members to know that as a result of an address given by Mr. Franklin H. Wentworth, November 29th last, on the subject of the Significance of the National Fire Waste, a branch of the Ontario Fire Prevention Association was formed in this city. Hon. W. C. Edwards was appointed President, with Mr. C. Jackson Booth 1st vice-president, and Sir Henry K. Egan 2nd vice-president. Whilst not becoming obligated to all the principles enunciated by Mr. Wentworth, that is with regard to the abolition of the wooden shingle and the prohibition of the use of lumber in buildings higher than 10 storeys, there is much that lumbermen can learn by associating with, or forming branches of the Ontario Fire Prevention Association. Whilst on this subject of fire insurance, attention is again called to the report of all insurance in unlicensed companies, Lloyds, mutuals, or reciprocals for the year ending December 31st, 1913, under section 139

G. A. Grier, Montreal—Director

W. G. Power, St. Pacome—Director.

J. G. Cane, Toronto—Director.

P. C. Walker, Ottawa—Director.

of the Insurance Act. This information should be given on forms which are provided by the Insurance Department at Ottawa, and mailed by registered letter addressed to the Supt. of Insurance, not later than March 1st, 1914.

The membership of the Association was shown by the executive committee's report to be as follows:—Ontario, 65; Quebec, 31; Alberta, 1; Manitoba, 2; Saskatchewan, 1; British Columbia, 17.

The Transportation Committee presented a report in which it outlined the events of the past year in connection with matters relating to transportation. Most of these matters are already understood by readers of the Canada Lumberman, as the various events have been reported in these columns.

In reporting upon the matter of car demurrage, the committee recommended that the Canadian Car Service Bureau should be placed under the immediate jurisdiction and operation of the Board of Railway Commissioners for Canada.

Discussing the matter of claims for overcharge, the report recommended that an effort should be made to have incorporated in the proposed amendment to the Railway Act, a clause requiring that carriers shall pay interest on all legitimate claims where payment has been delayed beyond a reasonable length of time.

The report also made reference to ocean freight rates noting the encouraging prospects for the creation of some international controlling body to regulate ocean freight rates in the interest of shippers.

The Association and Its Work

After the presentation and acceptance of the various reports, Mr. Gordon C. Edwards discussed the work of the Canadian Lumbermen's Association. He had heard considerable criticism of late to the effect that the Association was not performing any valuable service for the industry. It was a very serious matter that anyone should give voice to a criticism of this nature and he hoped to hear the matter discussed in detail. His own opinion was that those who complained, were themselves largely to blame for not co-operating enthusiastically with the Association in its work. One of the greatest benefits secured from membership in the association was the good fellowship which it created among men who had formerly entertained rather poor opinions of one another.

Mr. J. G. Cane, Toronto, stated that the advantages secured through the claims branch of the Association were themselves sufficient to establish it in the favor of all members of the lumber industry.

The secretary thereupon reported that the claims branch had handled a number of applications from members and had succeeded in collecting quite a lot of money.

Mr. Duncan McLaren, Toronto, stated that an equally important matter, in which the assistance of the Association was valuable, was the work done by its credit rating branch. He believed that this work would be made of the greatest value to the trade, that it could be of greater value to them even than any of the commercial rating reports they bought elsewhere. If they could only develop the credit rating service and specialize in the ratings of lumbermen, they would quickly see that the association would grow in importance and usefulness. Co-operation from the members of the Association could make this branch of their work so useful that many more members would join.

Mr. W. E. Bigwood, Toronto, said there was no doubt that membership in the Association was valuable to all lumbermen. He also believed thoroughly in the importance and value of a good credit rating service.

A discussion on the importation of southern pine was introduced by Mr. G. A. Grier, Montreal, who urged that something be done to reduce the severe competition from this quarter.

Mr. W. Gerard Power, St. Pacome, P.Q., took the view that southern pine, so far as he was concerned, might come into the country as much as it liked. His company could sell its spruce in spite of the southern pine competition.

The president remarked that, in his opinion, they ought to do something towards educating the architects and inducing them to use Canadian woods.

Mr. Gordon C. Edwards remarked that it was well known in this country that we could not supply the lengths desired and that contractors were compelled to go to the United States or to British Columbia for their timber. It was all very well for Canadian manufacturers of lumber to get together and say that southern pine ought to be excluded by the architects because it was being put down here at two or three dollars a thousand less than Canadian woods. They could not blame the contractors, the southern pine men, nor the members of the association. He believed that architects should specify the use of Canadian woods as much as possible, but did not think they could do any good by trying to exclude southern pine.

Mr. McLaren asked whether the architects were deliberately in the habit of specifying southern pine.

The secretary said that the government tried to use Canadian woods whenever possible. He thought the architects' association

was really trying to use Canadian woods as much as possible. The principal thing for the lumbermen to do was to let the architects see that they were thoroughly alive to the question and that they were keeping tab on it in detail.

Mr. A. H. Campbell said that, in Montreal, he always hoped that a Boston or New York architect, or contractor, would be in charge of any big buildings to be constructed, because they would use spruce, whereas if a Canadian got the job, he would specify southern pine. American lumbermen were accustomed to spruce and were using large quantities of it. Canadian architects and contractors, however, seemed to be afraid of it. He thought that something should be done by the association to induce the contractors, architects, car builders and the governments to use Canadian grown woods, prices being equal.

The president said that he would not want to prohibit yellow pine coming into the country. He believed in every man buying wherever he could buy cheapest. What he objected to was the number of architects who specified yellow pine where spruce or Norway pine could be used to equal advantage.

Mr. Cane said that yellow pine, 2 x 12 in., 16 ft. was being offered in Canada at \$19 and \$21, while we were asking \$25 to \$27 for our Norway. If the situation had been the other way around, the Americans would not sit down. They would legislate against it, if they could not do anything else.

Mr. A. H. Campbell said that he understood the government to have succeeded in specifying Canadian wood for the Welland Canal.

The secretary said that a representation had been made to the government upon this matter, to the effect that wherever Canadian wood could be used on government works, canals, harbor contracts, etc., at an even price, it should be done. After all, the whole thing came down to a consideration of the contractor. If a contractor came to the government and said that he could not get Canadian timber of the size and within anything like the price of the southern pine, the crux of the situation was evident.

Mr. Wm. T. Mason, Montreal, believed that the matter resolved itself entirely into one of price. The best material they could get to-day in timber was fir or yellow pine. If they wanted stock 12 x 12 inch, 30 feet long, how many mills in the Ottawa Valley could furnish fifty pieces? There was not a single mill. The Association would be wasting a lot of time asking governments or architects to specify certain woods on certain contracts. This had been done in connection with the great harbor works at Courtenay Bay, St. John, N.B., and as a result, the work had been held up for several months. To-day, his own firm was figuring upon yellow pine for this work. They were selling millions of feet of fir and yellow pine on large contracts simply because they could not get native woods for the purpose. The price, demand and quality would govern the situation every time.

Mr. A. H. Campbell moved that a committee be formed to get in touch with architects and try to persuade them to give fair treatment to Canadian woods. He did not want any preference. He only wanted the architects to specify that Canadian woods could be used as well as Southern woods. If they would specify "yellow pine or Canadian woods" Canadian would have no cause for complaint.

Mr. John Donogh, Toronto, said that the yellow pine which was coming into such direct and ruinous competition with Canadian woods was the small dimension stuff and the low end No. 2 common, which was being dumped by the yellow pine manufacturer on Canadian markets. The southern manufacturer had found a convenient market in Canada so far as getting rid of their stock was concerned, though not perhaps a financially profitable market. The Canadian wholesaler was getting very little out of this trade. Most of it was done direct or by correspondence. He did not see that they could obtain any remedy by dealing with the architects. It was more their concern to see that this stuff was not dumped upon Canadian markets at lower prices than at the places of origin. He was of the opinion that yellow pine was being sold at very much lower prices in Canada than in the States. Probably six or seven dollars a thousand would represent the average price obtained by the southern manufacturer. He would like to know whether the customs department could not deal with this by finding out whether the stocks were being dumped in Canada.

The secretary said that one of the members of the association had sent him a circular received from a company in Tennessee. The Canadian complained that the prices quoted were dumping prices. He had investigated and had found that at the same time, the same material was sent by the same mill to Buffalo at exactly the same prices.

Mr. W. J. Lovering, Toronto, said that the short leaf southern pine, which was causing so much trouble was full of sap and would rot if it was placed near the ground. Most of the people who used it did not know this. There was southern pine that was quite the equal of our fir, namely, the long leaf pine, but this other stuff was

simply rubbish and could not be compared with any Canadian wood.

Mr. R. B. Elgie, Toronto, seconded Mr. Campbell's motion and upon a vote being taken it was defeated.

The following committee upon resolutions was then appointed: Gordon C. Edwards, Ottawa; William T. Mason, Montreal; W. E. Bigwood, Toronto; A. E. Craig, Toronto; J. G. Cane, Toronto.

The Business Man in Politics

In the afternoon, Mr. A. B. Cruikshank, New York, who represented several of the defendants in the recent actions instituted by the United States government against lumbermen for alleged restraint of trade, delivered a forcible and interesting address upon the business man in politics. Mr. Cruikshank's remarks were necessarily very much condensed on account of the brief time at his disposal, but he succeeded in stirring up great interest among his hearers. The principal point upon which he dealt was the present development of socialistic unrest in the United States. In his opinion, this attitude was nothing new. One might learn from history that it had been practically a constant factor, from the beginning of things, in all countries. It merely happened that conditions in the United States were now bringing more prominently to the front the representatives of those classes, which had been struggling from the very first, to affect the industrial welfare of the country. Mr. Cruikshank pointed out that the material progress of every country was dependent to a reasonable extent upon the men of intelligence and substance, who came to the front at periods of crisis and gave unstintingly of their efforts and ability, for the preservation of financial stability, the maintenance of the sacredness of contracts and the application of labor to its most profitable work.

Mr. Gordon C. Edwards proposed that a committee should be appointed to consider the advisability of developing the credit rating service. The following committee was appointed: A. E. Eckardt, Toronto; Duncan McLaren, Toronto; J. P. Johnson, Toronto; W. T. Mason, Montreal; A. H. Campbell, Montreal; G. A. Grier, Montreal; Mr. J. W. Smith, Pembroke; Mr. J. S. Gillies, Braeside, Ont., and P. C. Walker, Ottawa, who are to report at an early meeting of the board of directors.

Mr. Gordon C. Edwards introduced a discussion upon the workmen's compensation act which is now under consideration by the Ontario Legislature.

Mr. W. E. Bigwood said they might as well recognize the fact that the government was going to pass some kind of bill upon this question. The only thing the lumbermen could do was to make recommendations to the government for securing fair treatment between the employer and employee. He thought that they ought to appoint a committee to draw up the views of the lumbermen upon this question and submit them to the government. It might also be a good thing to work, in this connection, in conjunction with the Canadian Manufacturers' Association.

Senator Geo. Gordon said that each member of the Association ought to interview his local member of parliament and impress upon him the views of the lumbering industry. He also thought that the Association ought to appoint a strong committee with power to employ an able lawyer to look after the interests of the Association when the bill was before the Legislature.

Senator W. C. Edwards said that the proposed workmen's compensation act involved the most vital question that had ever confronted the manufacturers of Ontario. He was not one of those who believed that there should be no such bill, or that there should be no legislation in the direction of giving compensation to those who were unable to take care of themselves. An insurance act framed something along the line of the insurance act of Great Britain would be perhaps the most reasonable thing. The act which it was now proposed to pass, seemed to him to be class legislation of the most vicious character. After all, those who would be affected, so far as compensation was concerned would be a large minority of the people of Canada. A very large majority would be exempt from the operation of this bill. Why should a manufacturer, who, unfortunately, had a man injured in his employ, be any more subject to the payment of compensation than one who had a gardener, or anyone else working around his house. It seemed to him that the proposed bill was socialistic legislation of the worst character. If it went into effect, it would make a large minority of the people in this country—the manufacturers alone—responsible for all the accidents which occurred in their employ, whether the result of carelessness on the part of the manufacturer, or on the part of the individual himself. How could there be anything more unjust or more unreasonable? However, legislation of this class had already been enacted in most of the countries of Europe and the United States. All that could be done in Ontario would be to modify the proposed legislation to the greatest extent possible. The manufacturers could assure themselves that they would come out second best, without a doubt. If the bill as at present drafted were put into effect, it would put a premium upon the reduction of industrial efforts in Ontario. In many employments the

bill would close up factories, as it would be impossible to operate them under such conditions.

Mr. E. F. Perry, secretary of the National Wholesale Lumber Dealers' Association, who was in Ottawa, spoke briefly upon the same subject.

A motion was then carried to refer the matter to the board of directors with power to add to their numbers.

Mr. E. F. Perry then spoke upon the importance of the approaching Forest Products Exposition, urging the association to assist in its success.

Resolutions Passed

The committee on resolutions, which had held a separate meeting, presented the following resolutions which were carried:

That the Canadian Car Service Bureau should be placed under the immediate jurisdiction of, and be operated by, the Board of Railway Commissioners of Canada;

That the association express its appreciation of the attitude of the railway companies in conferring with the officers of the association in connection with tariffs affecting lumber interests;

That the transportation committee be authorized to take such steps as may be necessary to watch legislation brought before the Dominion parliament, affecting lumber shipments, and to arrange that the association be represented at any public meeting in this connection;

That the sympathy of the association be extended to Mr. J. R. Booth, in his recent suffering and that the thankfulness of the association be expressed in his recovery, also the hope that he will long be spared to work among them;

That a committee of three members be appointed to co-operate with the head office of the association in compiling statistics, relating to the lumbering industry in Canada, with authority to formulate a plan and put it into operation at as reasonable a cost as possible, the work to be done by the executive officers of the association, rather than by a committee;

That the thanks of the association be extended to Mr. R. G. Cameron for his services as honorary treasurer.

With the unanimous approval of those present, Senator Geo. Gordon, Cache Bay, Ont., was elected president of the association for the ensuing year. The nominating committee then presented its report which was accepted. The full list of officers for the ensuing year is as follows:—

J. R. Booth, honorary president; Senator Geo. Gordon, president; His Honor Sir. D. C. Cameron, K.C.M.G., Winnipeg, first vice-president; Angus McLean, Bathurst, N.B., second vice-president; R. G. Cameron, Ottawa, treasurer; Frank Hawkins, Ottawa, secretary.

Directors: Alexander MacLaurin, Angus McLean, W. Gerard Power, and Geo. A. Grier, representing Quebec; Senator Geo. Gordon, Gordon C. Edwards, E. A. Dunlop, W. C. Laidlaw, P. C. Walker, E. R. Bremner, Duncan McLaren, A. E. Craig, J. G. Cane, and W. J. Lovering, representing Ontario; John Hendry, A. D. McCrae and Wm. McNeill representing British Columbia; His Honor Sir D. C. Cameron, K.C.M.G., representing Manitoba, and A. L. Mattes representing Saskatchewan.

Banquet at the Chateau

In the evening a most enjoyable banquet was held at the Chateau Laurier, at which a large number of guests were present. The occasion was the first upon which ladies were invited to attend the banquet of the association and their presence added greatly to the pleasure of all present.

The new president, Senator Geo. Gordon, occupied the chair. The guests of honor seated upon his right and left included Hon. Geo. E. Foster, Sir Wilfrid Laurier, Hon. W. G. Hearst and Alfred B. Cruikshank of New York. Others at the table were Senator W. C. Edwards, Sir Henry Egan, E. F. Perry of New York, Gordon C. Edwards, W. A. Charlton, M.P., Wm. Thoburn, M.P., and Alexander MacLaurin.

Sir Wilfrid Laurier, the first of the speakers, dealt in a very interesting manner with the history of the lumbering industry in Canada. He believed that, with proper caution, the lumber industry in the Ottawa Valley would last until the end of time. After dealing with the various factors of danger which so frequently lead to the destruction of our forests, Sir Wilfrid suggested that a forestry congress should be held and that it should urge the carrying out of a thorough surveying of the water sheds and forest lands of Canada. The lands ought to be marked out definitely. Those that were fit for settlement and those that were not fit for it being strictly separated and the latter being set aside absolutely for the use of the lumbermen.

Hon. Geo. E. Foster drew an interesting comparison between the lumbermen of to-day and those of fifty years ago. His remarks were along lines somewhat similar to those of Sir Wilfrid Laurier. He expressed himself in favor of reforestation, but laid far greater stress upon the importance of conservation. He suggested that it might even be a wise step to consider the prohibition of the cutting of any more logs in the forests of Canada than were actually required for

the production of the lumber for which there was a demand in Canada. He did not put this forward as a definite plan to which he would commit himself, but rather as something which might indicate to his hearers the great importance which he attached to matters of conservation.

An excellent address was also given by Mr. A. B. Cruikshank of New York.

Important Changes Coming in Ontario

Hon. W. H. Hearst, Minister of Lands, Forests and Mines for the Province of Ontario, speaking of the forest resources of the province, appealed to the lumbermen to join hands with the different provinces and with the Dominion government in doing everything within the bounds of reason to conserve the great forest heritage of the country. In the province of Ontario they obtained half their revenue from timber, and without it, they would be face to face with the problem of direct taxation in some form or other. This was still more true in connection with the province of British Columbia. During the present year, Mr. Hearst said, he was setting himself resolutely to the task of trying to preserve the forests of the province from fire. He intended to establish superintendents who would have charge over all the rangers, would help them in the discharge of their duties and keep them in close touch with the department. He intended to proceed with the establishment of telephone services and lookout towers wherever practical in the province of Ontario. He would purchase gasoline boats and gasoline speeders and in many other ways he intended to make protection of the forests more effective than it had ever been in the past. The government could not do everything, however. The lumbermen must co-operate with them. Unless they had the sympathetic support of the people of Ontario, the money they were spending would not produce much in the way of results.

Hon. W. A. Charlton, president of the Canadian Forestry Association, expressed his appreciation of the progressive work which the Canadian Lumbermen's Association was doing.

Canadian Forestry Association Meeting

The 16th annual business meeting of the Canadian Forestry Association was held at Ottawa on February 4th. The principal business attended to was the passing of resolutions and their presentation to the Prime Minister and the Minister of the Interior. The resolutions adopted were as follows:—

Commending the Dominion government for extending the areas included in forest reserves on water sheds and non-agricultural land.

Recommending an examination of timber bearing lands, with a view to deciding whether they are best suited for the growth of timber, or whether their opening up would endanger the timber.

Recommending the extension of the fire ranging service, and that rangers should be selected on the basis of their special qualifications for the work.

Approving of the effective manner in which the Dominion Board of Railway Commissioners and the officers of the leading railway companies of Canada have worked together for the prevention of forest fires.

Recommending that the Dominion and Provincial governments conduct experiments to find out the best methods for disposing of debris resulting from lumbering operations.

Expressing the opinion that all appointments in the forest services of the Dominion and Provincial governments should be based upon capacity and experience.

Thanking the Dominion government for establishing a wood products laboratory and tendering co-operation in connection with its development.

These resolutions were presented to the Prime Minister and the Minister of the Interior by a deputation headed by W. R. Charlton, M.P. The Prime Minister and the Minister of the Interior each promised to give the resolutions immediate consideration.

The report of the directors of the Canadian Forestry Association for the year 1913 showed that considerable progress had been made in the work of the association. After referring to the successful convention held in Winnipeg and to the increased importance of the publication work of the association, the report stated that the work of forest protection and reforestry had made steady, if not

Wm. Power, M.P., Quebec, the new President.

rapid gains, in 1913. The Dominion government had appropriated \$514,000 for the work of the Dominion Forestry Branch. This work had been carried on with an increased staff, particularly in the field, the number of men in the outside service being 360, of whom 25 were technically trained. Patrolling and trail and telephone building had been carried on more extensively than ever before. The fire loss was the smallest in the history of the department, the amount burned over being only one fiftieth of one per cent. of the reserve area, of which only fifty acres was matured timber.

In Ontario, the government had spent on forest protection and development \$234,000, and the limit holders \$91,000, making a total of \$325,000. This had been spent chiefly in patrol work, 925 men being employed, 560 by the government and 365 by the limit holders.

In the province of Quebec, the amount appropriated for forest administration had been \$100,000 and \$18,000 additional for the fire protection branch. Limit holders had spent in the neighborhood of \$150,000 for their share of protection.

In British Columbia the forest protection fund, contributed equally by the government and the lessees had amounted in 1913 to \$375,000. During the year, 415 rangers had been employed, in addition to 60 employed by the railways. In the autumn, these men had been employed in cutting roads and fire lines, erecting telephone lines and lookout stations. In this way, by the autumn of 1913, 1,205 miles of trail and 529 miles of telephone line had been constructed.

In New Brunswick about \$35,000 had been spent by the government on forest fire protection, in addition to the amount which was spent by license holders.

Progress was noted in protection by private individuals and corporations throughout the Dominion. The locomotives on 587 miles of railway had been changed from coal burners to oil burners. These lines are in the Rocky Mountains and on Vancouver Island.

The directors report that lumber and pulp companies were cutting timber with less waste than ever before. A number of them were having their holdings surveyed and estimated by forest engineers and some were beginning to experiment in thinning and replanting.

The use of wood preserving methods was rapidly increasing.

The educational side of the work was also referred to, the directors noting that a development of lower grade schools, to educate forest rangers and woods superintendents was now the most pressing educational need.

The election of officers for the ensuing year resulted as follows:—President Wm. Power, M.P., Quebec, P.Q.; vice-president, F. C. Whitman, Annapolis Royal, N.S. New directors, Hon. W. J. Roche, Hon. Geo. E. Perley, A. C. Flumerfelt, Vancouver, B.C.; Hon. Nathaniel Curry, Rt. Rev. P. E. Roy, Quebec, P.Q.; H. R. MacMillan, Victoria, B.C., and Clyde Leavitt, Ottawa.

The next convention will be held, at the invitation of the government of Nova Scotia, in Halifax, next August.

It is interesting to note that the Prime Minister asked the opinion of the Association regarding a proposal for holding a National Forestry Congress. The Association discussed this matter at its afternoon session and decided in favor of the proposal, giving it as their opinion that it should be held next winter. This conclusion was communicated to the Prime Minister, who has not, as yet, indicated his intention further.

John R. Booth Again at the Plant

John R. Booth, the veteran Ottawa lumberman, who recently sustained a fracture of his left leg and several minor injuries, when a heavy timber fell upon him, has made such good recovery that he was recently able to rejoice all his friends, and especially those at the office and plant, by visiting the works in a conveyance. His only regret at the time was that his crutches had been left at home and he could not get out and examine the new buildings more closely. With fair weather and continued improvement in his health, Mr. Booth will be back at work again in the near future.

Nova Scotia's Industries Illustrated

A very attractive illustrated booklet describing the various manufacturing industries in the province of Nova Scotia has been published by the Nova Scotia Publicity Committee of the Canadian Manufacturers' Association. The book is contained in a very handsome colored cover illustrating a busy harbor scene in Nova Scotia. The majority of the material in the book consists of illustrations of the various important plants throughout the province. The most important idea that one gathers from the book is the fact that the industries of Nova Scotia are extremely varied and have been developed to a remarkable degree of efficiency. One may also gather the fact that one of the most important industries in the province is that connected with the manufacturing of lumber and the conversion of its product into finished materials. A copy of this booklet may be secured by writing to the Secretary of the Publicity Commissioner at Halifax.

Sawmill of the New Ontario Colonization Company,
Jacksonboro, Ont.

Pulpwood Rossing Plant of the New Ontario Colonization Company,
Jacksonboro, Ont.

New Ontario Company's Fine Equipment

Will Operate Winter and Summer at Jacksonboro—Rossing Mill, Planing Mill and Sash and Door Plant Included

Readers of the Canada Lumberman are already familiar with some of the operations of the New Ontario Colonization Company, Limited, whose mill is located at Jacksonboro, Ont., and whose sales office is at Buffalo, N.Y. An illustrated article appeared in these columns last year, describing the small lumber manufacturing plant erected and operated by this company in the earlier stages of its work. This mill served the purpose of producing lumber for the larger mill and also for the office buildings for the company and dwellings for the first settlers. The New Ontario Colonization Company, Limited, purchased from the government of Ontario the townships of Kendrey and Haggart, covering about 100,000 acres. The Transcontinental Railway or what would be called the Grand Trunk Pacific, runs through both townships and the company are to remove the timber and colonize these townships. Their manufacturing operations and camps are located at the junction of the Mattagami River and Transcontinental Railway.

As will be seen from the illustration, the company have a good smart sawmill. It is equipped entirely with new machinery, including a double cutting band saw and a resaw. The capacity of the mill is 50,000 feet per day. A pulpwood rossing department is operated in connection with the sawmill. Its capacity is 50 cords of pulp wood per day. The company are also operating a well-equipped planing mill, sash and door plant, etc. The timber upon which they are operating runs largely to spruce, whitewood and brown poplar. It includes also some tamarac. The spruce is an excellent quality with close grain and takes a smooth dressing. The larger run of spruce will be put into lumber and the balance into pulpwood. The whitewood, brown poplar and tamarac will be put into lumber.

The company have a large hot pond from which their saw logs and pulpwood will be taken. They will thus be able to operate throughout the winter. In connection with the mill at Jacksonboro, the company also conduct a general store.

Although the lumber manufacturing end of the company's work is of great importance, the company is essentially a colonization proposition and points out with interest that the soil in both of its town-

ships is of excellent quality, the top soil being black loam and the sub-soil a clay loam. They are confident that the rich soil with the long, hot summer days, will bring very satisfactory results from an agricultural standpoint. In fact they have already demonstrated this to their own satisfaction. The company already have a number of settlers and prospects for many more. Many will be located during the coming spring and summer. The company will be able to use their labor and hire their teams when they can be spared. In this way they believe that there is nothing to prevent settlers from making good in the clearing and cultivation of their land during the summer, and turning to advantage their own services and those of their teams in either the mills or in the woods, during the winter.

Further interesting facts in connection with the sawmill may be mentioned. It has two log slides or jacks, one of which carries the logs to the sawmill and the other to the rossing mill. The double cutting band mill was manufactured by the Wm. Hamilton Company, Peterboro, Ont. The resaw is a timber resaw, manufactured by the Berlin Machine Works, Hamilton, Ont. The balance of the sawmill machinery was put in by the E. Long Manufacturing Company, Orillia, Ont. All of the machinery on the pulpwood rossing side of the mill was put in by the Waterous Engine Works Company, Brantford, Ont. The power plant, consisting of three large boilers and engine, of 450 h.p., was purchased from the Wm. Hamilton Company, Peterboro.

The planing mill is thoroughly equipped for dressing lumber and manufacturing sash and doors, flooring, etc. A large portion of the machinery, including the planing mill resaw was purchased from the Berlin Machine Works, Hamilton, Ont., and the balance from Cowan and Company, of Galt, Ont.

The company have an excellent yard for seasoning their lumber and the stock will be put out from the transfer table over a tram. By running both winter and summer, the company will be able to furnish the trade continually with good bright lumber.

From the above facts it will be seen that the prospects for the New Ontario Colonization Company are exceptionally bright.

The Commercial Importance of Poplar

Second of a Series of Articles Upon Native Canadian Woods—Characteristics and Uses of a Wood That is Not Generally Appreciated

By R. G. Lewis

IT has been said that a weed is not necessarily a useless plant but rather one for which no use has yet been found. There are a number of trees in Canada that have been considered as weed trees for many years and would still be considered as such but for the increasing scarcity of wood and its rapid rise in price. When the supply of the more desirable, more easily utilized woods, begins to fail to meet the demand, manufacturers must turn to the "weed trees" and study new ways of adapting these to their purposes.

Basswood is valued chiefly on account of its toughness and its power of holding its shape. Tulip or "yellow poplar" has similar qualities and in addition is very soft and easy to work. Red gum, on account of its cheapness and the fact that, once properly seasoned, it holds its shape well, is often substituted for basswood and tulip. The wood of most of the poplar species possesses these characteristics to a greater or less extent and when properly seasoned can be used as a substitute for basswood or tulip just as well as the imported red gum.

In addition to its use as a substitute for other woods, poplar is preferred by some manufacturers for certain purposes above all other woods because of its own particular qualities. Poplar is considered to be the most suitable wood for the manufacture of excelsior and wood wool because of its softness, toughness and elasticity. While poplar is not among the most important hardwoods (broadleaved trees) of Canada, its use is increasing every year as new uses for the wood are being developed.

Increasing Use of Poplar Lumber

The use of this wood for lumber in Canada increased from 1908 to 1912 by over sixteen per cent., an average annual increase of over four per cent. Its use for pulp manufacture has increased at a much greater rate. Canada cut, in 1912, 180 per cent. more poplar pulpwood than in 1908, an average annual increase of 45 per cent.

In 1912 Canada cut 7,523,000 feet board measure of poplar lumber valued at an average price of \$13.30 per thousand feet. The wood has been reported from every province in the Dominion but the greatest quantities are cut in Ontario, Quebec and Manitoba. During this year 4,405 cords of poplar pulpwood were consumed by Canadian pulp mills at an average price of \$6.20 per cord. This would approximately represent 2,440,000 feet board measure.

During 1912 Canadian slack cooperages manufactured over six million poplar barrel staves, over three hundred thousand sets of barrel heading, and over a hundred thousand hoops, representing at least two million board feet of lumber.

At least 5,000 cords of poplar are annually manufactured into excelsior in Canada, which represents a consumption of 2,770,000 feet board measure. These four items make a total of 14,733,000 feet of poplar cut in Canada in a year. When we consider the quantities of this wood used for firewood, for fence posts and rails and exported as unmanufactured pulpwood, we can safely estimate the total cut of poplar at 25,000,000 feet, which is a small quantity compared to the existing supply.

The Commercial Species of Poplar

There are eight species of poplar which reach tree size in Canada, and of these, two or possibly three species form the bulk of the wood cut commercially. The wood of the poplars, speaking generally, is soft, light in weight, tough, easily worked and both tasteless and odorless, but is weak and very perishable in moist situations. Owing to its weight, when green its slippery bark and the high percentage of defect, the logging of this wood is expensive; at least twenty per cent. more so than spruce. This fact explains the relatively high price of poplar lumber and its scarcity on the market. The difficulty in seasoning the lumber after sawing also tends to decrease its popularity, but, if proper care is exercised this difficulty can be overcome. The lumber does not shrink while seasoning but checks and warps badly. Once properly seasoned it holds its shape well, can be nailed without splitting and resists friction to a remarkable extent because of its compactness and its tough fibres.

Commercially, the poplar lumber is usually divided into two classes, aspen and cottonwood, which have different properties and are used for different purposes. The aspen lumber is made up of the wood of two species, common aspen and large-toothed aspen.

Distribution of the Common Aspen

Common aspen (*Populus tremuloides*) is found south of a line running through the Labrador peninsula, around the south of Hud-

son Bay and northwest to the mouth of the Yukon river in Alaska. It is found south of this line throughout Canada and the United States as far south as Missouri and Southern California. It is probably the most widely distributed tree in North America. It is abundant throughout its entire range and reaches its highest development in Northern Alberta and Saskatchewan.

Large-toothed aspen (*Populus grandidentata*) has a much more restricted range than common aspen and is nowhere so abundant. It is found from Nova Scotia to the Riding Mountains in Manitoba, south of the height of land in Canada and southward to Delaware in the United States. It is not of great commercial importance as it does not reach the size attained by common aspen and it is usually sold mixed with this species which it closely resembles.

The wood of the aspens has perhaps a finer grain than that of the cottonwoods and is usually lighter in color. It is not quite so strong nor tough as balm poplar, otherwise there is little difference in the structure of the two woods. The aspens, however, are very liable to attack by a fungus known as the "false tinder fungus" (*Poly-porus ignarius*) which causes great damage to trees over 20 years old in Canada; in some cases rendering useless, eighty per cent. of a stand. The tree, however, is not subject to frost cracks and wind-shake which cause considerable damage to balm poplar. The wood of the aspens makes excellent firewood, burning while green, without sparks, and producing a hot, quick fire. Probably more aspen is used

Balm Lumber in pile, showing prevalence of Wind-Shake and other defects

for firewood than for any other purpose, although small material is often used that would be of little use for other purposes.

The greater part of the poplar wood used for pulp making is of the aspen species. This wood makes a weak, light-colored, pulp, easily bleached, and is usually treated by the soda process. This chemical process, when applied to spruce, merely separates the fibres from one another and does not impair the strength of the individual fibre. When applied to poplar, however, it breaks down the fibre and produces merely a pulpy mass without any cohesive strength. This pulp is mixed with spruce or some other tough sulphite pulp in the proportion of 60 per cent. poplar soda pulp and 40 per cent. spruce sulphite. This makes a very superior, tough, white paper, easily sized, and much cheaper than rag paper. It is the most economical book and magazine paper made. The poplar pulp in reality adds only body to the paper as it lacks a long tough fibre like that of spruce and could not be used for paper without the tougher pulp to bind it together.

A Superior Wood for Cooperage

As a cooperage wood, aspen ranks among the best, especially for barrels to contain food stuffs, such as flour, sugar, fish, meats, etc. It is not so strong or tough as elm and birch, but is easily worked and imparts neither taste, stain nor odor to the contents of the barrel. This wood has also been reported as having been used in this connection for candy and lard pails, spice kegs, sugar and jelly buckets, in Canada and in the Eastern United States.

For excelsior, aspen poplar is the favorite wood in Canada and in most of the States. The wood is soft and tough and the excelsior

made from it has the softness and elasticity necessary for the purposes for which this commodity is used. Excelsior is made by peeling narrow strips or ribbons from billets of wood. The wood is usually barked and cut into lengths to fit the machine. The product is called "wood wool," when the ribbons are narrow and thin (1/100 of an inch thick) and is used for upholstering. The coarsest excelsior is used for stuffing mattresses, packing china and other fragile commodities, and, in the form of shipping pads or sheets of excelsior covered with wrapping paper, for protecting furniture and other crated goods in transit.

In the form of lumber, aspen is used for rough construction in regions where other woods are scarce. Its lack of durability when exposed to moisture prevents its use when more durable woods can be obtained. It has long been valued for barn and stable flooring and for stalls, as its toughness resists the wear due to knawing and stamping of animals. For interior house flooring this is a valuable wood when properly seasoned. It has a fine, close grain, holds its shape, and does not splinter or wear rough. Its white color is an attractive feature. For other interior house decorations aspen is used in the form of ceiling, moulding, wainscoting and panelling, as it is easily worked and takes paint well.

For boxes aspen is valued for the same reasons that make it a popular cooperage wood. It holds nails without splitting, is light, tough and free from taste, stain or odor. These qualities also fit this wood for refrigerator lining. It is used for butter and meat boxes, cheese box heading and boxes for all kinds of food stuffs as well as tobacco and cigars. It is often preferred by shippers on account of its white color and the fact that it is easily stencilled, making an attractive box. It is used for crating materials on account of its toughness and lightness. On account of the fact that it does not stain it is preferred for the crating of ornamental stone. Aspen is used to a great extent for cloth boards, as it is light and does not splinter nor wear rough.

The use of this wood for "inside work" on furniture and for box and body work on vehicles and agricultural implements provides a substitute for basswood and yellow poplar (tulip), which are now becoming scarce and expensive. Its use for this purpose is not so important as the use of the cottonwood poplars.

Aspen poplar is used in some of the northern states for matches, although its use in Canada for this purpose has not yet been reported. Large quantities of aspen poplar in Russia and Scandinavia are annually manufactured into matches or exported as match splints or blocks to all parts of the world. Swedish, Russian and Norwegian safety matches, so commonly used in Canada, are all made from aspen poplar.

Aspen is demanded by certain manufacturers for certain purposes, some of which are peculiar. Manufacturers of oyster and fish knives demand this wood as they claim that handles made of it will not slime. Mirror and glass polishers use aspen blocks to polish mirrors because it is soft and wears quickly and carries the polishing powder or "rouge" without clogging up and glazing over. In addition to the above, aspen wood has been reported for the manufacture of baskets, brush backs, caskets, dipper handles, dishes, dowels, rough boxes (or shells), shoe findings, spools, toothpicks and toys.

The Uses of Balsam Poplar

Balsam poplar (*Populus balsamifera*), or "balm" as it is often called, is the second most abundant poplar species in Canada. The tree is found further north than aspen in eastern Canada, but not so far north in the west. Otherwise it covers practically the same range as aspen, but is never so abundant. Balsam poplar demands a richer, moister soil than aspen and is, therefore, confined more to river bottoms. It reaches its highest development on the islands and alluvial flats of the Peace, Athabaska and other Mackenzie river tributaries. It is probably the largest subarctic tree in America.

The wood of this tree is usually sold with the cottonwoods which it resembles closely. It is stronger and tougher than aspen, is not liable to attacks of the false tinder fungus, but is subject to wind-shakes and frost cracks. It is very poor firewood and is not used for flooring on account of its dirty color. However, this wood is considered more valuable for lumber than aspen, probably because of its greater strength and freedom from defect. Because of its color, it is not used to any extent for pulp when aspen is obtainable, but is a valuable material for excelsior, box boards and slack cooperage. This wood is used instead of aspen wherever greater strength is required. It is preferred to aspen for veneer in the making of baskets and berry boxes in the Maritime Provinces, Ontario and the Northern States. It is also reported for tobacco and cigar boxes, three-ply trunk boxes and veneer barrels.

These two species probably form ninety per cent. of the poplar used in Canada east of British Columbia.

An Important British Columbia Species

Black Cottonwood (*Populus trichocarpa*) grows in open groves

along the banks of streams and lakes on the Pacific coast from southern Alaska southward through western British Columbia, east to the Columbia valley and southward to California. It mixes with balsam poplar in eastern British Columbia and reaches its highest development near sea level on the coast. It is the largest broad-leaved tree (hardwood) in British Columbia, reaching the height of 200 feet and a diameter of 7 to 8 feet, being the tallest and one of the largest of all the poplar species. Being soft and compact, the wood has always been a favorite with the Indians for making dugout canoes, apart from the fact that large, clear trunks can be readily obtained.

Being the only soft non-resinous wood on the Pacific coast, the black cottonwood is used for more purposes than the eastern poplars. It is the only substitute obtainable for basswood and yellow poplar, and is used in place of these woods to a great extent.

The wood is greyish white, soft, odorless, tasteless, straight and even-grained, very light, long-fibred, readily nailed, glued, and veneered. It resists shrinking, swelling, warping and splitting, and is much superior in its physical qualities to the aspens or balsam poplar. It is used to the greatest extent for boxes, pulp, excelsior and slack cooperage. This wood is used for the same purposes as the aspens and balsam poplar but to a greater extent. It is the only available wood for core stock and cross banding in veneered furniture, fixtures and interior finish. Pack saddles and pulleys are made of this wood as it nails without splitting and holds its shape. Its good qualities are better understood and taken advantage of in the western States than in British Columbia where the wood is little used except for boxes and cooperage.

Common cottonwood (*Populus deltoides*) is nowhere abundant in Canada. The tree is found in parts of southern Quebec and Ontario, but much of it has probably been planted. It is also found occasionally in the river bottoms in southern Alberta. It is really not of commercial importance in Canada except that large quantities are imported from the United States where the wood is of great commercial value. With the black cottonwood of the Pacific coast and the southern swamp cottonwood this is considered to be the most valuable poplar lumber tree. Its wood is stronger and tougher than the aspens or even balsam poplar which is usually classed with the cottonwoods. It is difficult to season but repays any trouble or expense that a careful seasoning process may involve.

Cottonwood lumber has long been understood and appreciated in the middle west and southern States. A list of its uses would fill a volume and include all the uses to which a strong, soft, non-resinous wood could be put.

Suggestions for Manufacturers

Some of these might be valuable suggestions to manufacturers who import basswood and tulip when balsam poplar (in the East) and black cottonwood (in British Columbia) are plentiful close at hand. The wood is considered to be the best substitute obtainable for tulip for waggon beds and bodywork, and is becoming scarce even in Arkansas (the State producing the most of this material). Furniture frames and exposed parts of kitchen furniture are made of this wood. Ironing boards, clothes racks, chair dowels, washboards and kitchen woodenware are made from a light, soft wood that will not splinter or wear rough. Cottonwood is the cheapest and best material obtainable. Bake boards, saddlers', harness makers' and shoe makers' boards; cigar makers' boards and boards and table tops of all kinds on which cutting tools are used, are made of cottonwood because it is compact, holds its shape and does not dull the tools.

Three other poplars are found in Canada but are of no commercial importance. Two western cottonwoods are found in the river bottoms in southern Alberta and Saskatchewan but are only used locally for fuel and fencing. A rare and unimportant species is confined to Vancouver Island, but is small and of no commercial value.

Vigorous Reproduction and Rapid Growth

Poplar, with birch, has the reputation of being one of the first trees to take possession of burned or cut-over forest land or abandoned farm land. Trees twenty years old bear abundant seed. The flower buds become conspicuous in the fall and develop into catkins in the early spring, ten days before the leaves appear. The seeds ripen and are scattered by the wind about the time the leaves are beginning to unroll. The seeds are very minute and are covered with cottony hairs which bear them up so that they fly like light snow. Considering that the seed-bearing flowers and the pollen-producing flowers are on separate trees, or that the trees are of different sexes and that only about half the trees can bear seeds, the seeding capacity of the poplars is remarkable. Many of the seeds are abortive, the fertile seeds lose their germinative capacity in two or three weeks and the seeds cannot germinate except on the raw mineral soil free from undecayed vegetable matter. In spite of these drawbacks, the poplar spreads enormous numbers of seeds in its vicinity and usually obtains a foothold in the same year in which the seeds are produced. This accounts for the fact that poplar seedlings spring up in the late summer and early fall on areas that have been burned or cleared in the early part of

the same year. The seeds are very light and are carried great distances by the wind. The seeds of trees growing along river bottoms fall into the stream during high water and are carried many miles downstream and deposited on the low, flat river bottoms by the falling waters, where they sprout readily. This partly accounts for the prevalence of the cottonwoods on river flats. The poplars sprout readily from root suckers when the older trees have been cut down or burned. These sprouts grow very rapidly at first, but seldom reach tree size.

The poplars are very rapid growing trees but only in their youth. They are very intolerant of shade and, if crowded, die quickly; but if they are well established they grow very rapidly for twenty or thirty years. They are a great benefit to other tree seedlings that grow with them as they have open crowns which admit an abundance of light for more tolerant species such as spruce. Thus the poplar acts as a nurse tree for the more slow-growing evergreen tree. The poplar soon begins to decline and at the age of seventy to a hundred years, when the spruce is in its prime, the poplar has all died off.

In the east, poplar reaches a diameter of six inches on the average in twenty to fifty years, and the twelve inch diameter in from fifty to one hundred years.

The average size attained by trees in the east is from 60 to 70 feet in height and from 18 to 24 inches in diameter. Few trees exceed the 100 year age limit. The average mature stand, clear of defect, is from 70 to 80 years old.

The greatest damage to the living tree is caused by fire, fungi, wind and insects. Frost has little effect on aspen and its effect on balsam poplar, while reducing the value of the lumber, does not seem to injure the health of the tree to a very great extent.

The poplar in the east, as a planting proposition, is very attractive. While the wood is of little value compared to slow-growing species, its value is increasing with its increasing uses.

The value does not depend altogether on the size of the material, as small sizes are sufficient for most of its uses. The tree grows very rapidly up to 20 or 30 years, and the materials from thinning can be utilized from the start. The final crop is utilized more completely than that of any other wood. These facts combined with the fact that this tree will grow in medium or poor soils makes it at least a commercial possibility from the standpoint of forest planting.

In the west the aspens and cottonwoods grow less rapidly at the start but are longer lived and reach greater size than those in the east.

Building Permits Decreased During 1913

During the year 1913 the building permits granted in fifty cities in Canada were for a total value of \$167,518,614. During the year 1912 the total value was \$201,161,550. There was thus a decrease of \$33,642,936. An analysis of the reports shows that Toronto is still at the head of the list. The total value of Toronto's building permits for the year 1913 was \$27,038,624. Montreal came very close to this, with a total of \$27,032,097. Montreal's total is all the more interesting because it showed an enormous increase, the total for 1912 having been \$19,408,600. Toronto permits were practically identical in value with those of 1912. Going back over a period of six years, to the year 1908, Toronto's building permits have increased from nearly \$12,000,000 to a little over \$27,000,000. The total values of building permits in Toronto for the six years from 1908 to 1913 was over \$121,000,000. After Toronto and Montreal the following cities rank in order so far as the total value of permits is concerned:—Winnipeg, Vancouver, Edmonton, Calgary.

In the Maritime provinces the most interesting feature is the great increase at St. John, N.B., from \$566,200 in 1912 to \$2,380,660 in 1913.

In the city of Quebec, building permits for 1913 were more than double those for 1912, the total being \$1,929,781. The building permits of greater Montreal reached a total of \$35,000,000.

The aggregate amount of building in Ontario cities during 1913 showed practically no change, the total for nineteen cities being \$51,546,101 as compared with \$51,486,204 in 1912.

With few exceptions, the cities of Western Canada showed decreases.

To Increase Rates on Pulpwood Shipments

The Dominion Board of Railway Commissioners have issued an order allowing the Temiscouata Railway to increase its charges on pulpwood shipped from stations on its line to points in New York State and other points reached by the C. P. R. The increase authorized, and which was protested against by the Eastern Townships Lumber Company, is one-half cent per hundredweight. It was the desire of the railway to have the increase come into effect on January 24. The Board has decided, however, that there should be a reasonable time allowed for the completion of contracts, and has ordered that the new rates shall not be effective until August 15, 1914.

Death of J. H. Redfern, Montreal

The Late J. H. Redfern, Montreal

By the death of Mr. J. H. Redfern, at the age of 76, Montreal has lost its oldest retail lumber dealer. For 42 years he was in business in that city, building up with others a very extensive trade. Mr. Redfern was a native of Douglas, Isle of Man, and when sixteen years of age went to Troy, New York, where he lived for about 15 years, being engaged in the lumber business. From there, he went to Three Rivers, P.Q., to look after the lumber interests of the Hon. J. K. Ward.

The next move was to Montreal, where he entered into partnership with Mr. Ward as retail lumber dealers. About 13 years ago Mr. Ward died, and Mr. John Ward and Mr. C. I. Root became partners with Mr. Redfern, under the name of J. K. Ward and Company. Subsequently Mr. J. Ward and Mr. Root withdrew, and Mr. Redfern carried on the business alone, and continued to do so

under his own name, until his death.

Mr. Redfern was a man of great energy, devoting almost his entire attention to the business. Two years ago he had a very severe illness from which he never fully recovered. Notwithstanding his ill health, Mr. Redfern continued to stick to business, and could not be persuaded to take a prolonged rest. A little over five weeks ago he became worse, and was compelled to keep within doors. From then on he failed gradually and succumbed to nervous trouble.

Mr. Redfern was never married. He had no relations in Canada, but some on the other side. At one time he was a member of the Westmount Council, and also Mayor of that city. From 1899 he was a member of the Westmount Library Committee.

The land on which the yards stand is the property of the Ward estate, but Mr. Redfern's business and effects are, under the will, to be sold within eighteen months.

New York Markets More Promising

Chase, Talbot & Company, New York, in their Lumber Market Letter under date of February 2nd, say: Thus far we have experienced no winter storms, and while the usual February severity is expected, still, building operations can only be briefly delayed. The steel trade has generally been considered a barometer, and, as greatly increased tonnage engagements for steel have recently been booked, we may soon expect the common gossip of the lumber trade to take definite shape, with a call for numerous early spring shipments. Maine and West Virginia spruce mills are holding prices firm, but we regret to report that the yellow pine operators in the south appear to need business so badly, that they are willing in many instances, to cut to ridiculous figures. An influential dealer and buyer in large quantities, stated to the writer to-day, that some of the yellow pine salesmen were "talking up prices," but when it came to actual business (even if for May to July delivery), they would cut prices to a lower mark, than any of record in recent years. At a normal parity, spruce will be given preference, but it appears that yellow pine is supplied wherever it can be substituted.

An oasis in the lumber trade desert (as well as in all branches of industry) is the changed monetary conditions since the first of the year. Any worthy borrower can secure loans for his requirements at reduced rates. The continued hoarding of funds by bankers in anticipation of currency legislation is now having and will continue to exercise its beneficial effect. Low tonnage rates reflect but little benefit, in consequence of the scarcity of export orders. The English market is dead. Deals are selling at \$3 to \$4 off. River Plate business is very dull. The West Indies and African trade is below par. From the Pacific Coast comes the report that stocks in the Orient are ample.

In our opinion there will be a substantial increase in the volume of trade during 1914 as compared with 1913. During 1913 there was some increase in trade over the previous year, but prices were somewhat lower. Stocks are now about 50 per cent. greater than they were a year ago.—Columbia River Lumber Company, Golden, B.C.

Jas. D. Lacey and Company, whose Oregon office was formerly in suite 1107, Falding Building, have recently moved to suite 1313, Northwestern Bank Building, where they will have larger quarters in which to carry on their continually expanding business.

Sir Edmund Walker's View of Business Conditions

At the annual meeting of the Canadian Bank of Commerce, held at Toronto, Sir Edmund Walker, president, delivered an address, which, as usual contained a great deal of carefully thought out analysis of the financial and industrial situation in Canada. "A year ago," said Sir Edmund Walker, "the tide of expansion seemed still to be in flood, although in some quarters a check was either in plain sight or had here and there made itself felt. Money for certain purposes, notably in connection with real estate, was not so easy to obtain as in former years, yet little heed was apparently paid to the oft-repeated warnings of bankers and others who tried to forecast the future, although at the end of the year we must conclude that, after all, such warnings did have some beneficial effect. Clearly we have come through a time of difficulty in a most creditable manner, and we can look forward to the future cheerfully if the spirit of prudence which now characterizes our people remains unchanged at least until another good crop has been marketed. Much of that part of our expansion which went too far reminds one of the diseases through which the young have to pass. We are doubtless glad if they escape them entirely, but we have no reason to expect that they will be so fortunate. Some undue speculation in real estate, and some over-building in connection with public improvements, is inevitable amidst such astonishing growth and prosperity, and it would be foolish to expect anything else. We are now realizing more accurately the value of real estate, and through the process we are gaining an experience which is absolutely necessary to the foundations of a sound prosperity. The Western country as a whole will not again have to suffer from this particular ailment of young communities. We have repeatedly deplored the fettering of the country by the high rent-charge which inflated real estate values impose, and the unfortunate effect of such a rent-charge on the cost of living, and if there is now to be a pause in the upward movement of values there will in any event be a corresponding gain to all landless people.

"Immigration has not yet been much checked by the curtailment of industry, indeed, except from the United States, there has been a large increase during the year. The British immigrants exceed in number the combined total of those from Europe and Asia, and very much exceed those from the United States. The largest increase as compared with the figures of previous years, however, is in the division which includes all countries except Great Britain and the United States. Here the increase, December figures being estimated, is 32 per cent. From Great Britain the increase is 8 per cent., while from the United States there has been a decrease of 17 per cent. The total number of immigrants, December figures again being estimated, was 417,709, as compared with 395,804, the revised figures for 1912.

"In the six months of the current fiscal year ending September, the complete figures for which have been published, there is some improvement in the proportion of exports to imports, and since September a greater improvement has taken place. As to our exports we are glad to report an increase during this period in every group, while there has been a decrease in many of the classes of imports.

"It was evident to any student of the situation a year ago that Canada, and other borrowing countries, would be put to a severe test during 1913. What we were not prepared for was that this country should be singled out as, in some measure, chief among the sinners of this kind. It is well, however, to remember that when money becomes scarce in the great markets of the world, the chief borrower is always told he has obtained too large a share and that he must stop borrowing for the time being. We had scarcely realized that Canada had become the chief borrower, or practically so, and somewhat resented being held responsible for a situation created by the combined financial requirements of all the active mercantile nations of the world. However, we have had our warning, and shall doubtless act upon it.

"The fact remains that under all this pressure England has taken more of our securities this year than ever before. She has patiently remembered that we are obliged to finish the many sound and important enterprises, public, semi-public and private, which had been undertaken before the financial clouds began to gather. That such enterprises will command the money of the investor in preference to loans for the rehabilitation of foreign countries devastated by war, or in preference to securities based upon new ventures, we need not doubt, and out of the vast sum available each year in the markets of Europe for new investments we may be sure of getting a generous share. We shall have to face a keener analysis of the nature of the security offered and the necessity of paying higher rates to the investor, and we shall do well to abstain during the next year or so from seeking to market any unnecessary securities, in order that we may do what we can to restore the balance between the investment resources of the world and the securities offered for sale. It is pleasing in this connection to see that the higher rates of interest offered have opened the markets of the United States to our securities to an extent quite unusual in the past.

"Now that we have come to a slight pause in the growth of North

America, it is well to bear in mind some of the more important things accomplished during this period of expansion. In Canada, in addition to growth in many other directions, we have in sight the completion of two new transcontinental railway systems, and while they have been building the existing system has successfully established its claim to rank as one of the foremost railway systems in the world. As regards the United States, the Panama Canal is practically finished; a tariff adjustment, the mere thought of which would have created panic a few years ago, has taken place, leaving the outlook in this respect a certainty instead of an uncertainty; a Currency and Banking bill, for which the country has been waiting about twenty years, has been passed, and a more reasonable attitude has been adopted towards the question of railroad rate adjustment. These are all events of the greatest importance which must profoundly affect the future of the two countries and so far as Canada is concerned we may surely feel that we are now entering upon a new and more important phase of industrial life, for which our equipment is more adequate than ever before. No more positive evidence of the need and value of such equipment could be offered than the ease with which the present year's crop was harvested, moved, and warehoused. This has been done in a manner which would have seemed impossible only a few years ago, and the value of the smoothness and rapidity with which the work was handled can scarcely be estimated."

St. Agathe Company Enlarging its Operations

The St-Agathe Lumber and Construction Company, Limited, Ste-Agathe des Monts, P.Q., which was recently incorporated under federal charter with capital of \$300,000 has absorbed the businesses of the St-Agathe Saw Mill Company, of G. A. Chevalier, lumber manufacturer, and of J. A. Pare, sash and door and lumber manufacturer. The officers of the new company are:—L. E. Parent, president; J. B. Reid, vice-president; Ferd. Forget, director; Maxime Lanthier, director; Jos. A. Pare, director, and Ed. Parent, secretary-treasurer. The company are erecting a new factory for the production of lumber, doors, sash, mosaic and English flooring, maple flooring blocks and all small-wood wares in hardwoods and soft woods. The factory will be operated by electricity. The company will also erect a factory for the manufacture of cement products, such as building cement blocks, chimney cement blocks, cement culverts and water pipes for roads, etc. The company intend to undertake all kinds of public and private contract works, also to trade in real estate, etc. They are the owners of large properties in St-Agathe and of about eight miles of timber limits located near the mills which the company have acquired. The head office is at the former office of the St-Agathe Saw Mill Company.

The proposed new large plant of the company will be erected directly opposite the C. P. R. station at Ste-Agathe des Monts. At this plant small-size wood, generally left to waste in the bush, will be manufactured into various articles for sale. The president of the new company is the former manager of the St-Agathe Saw Mill Company Inc., which he organized in 1902. His energy and business ability enabled him to build up a large trade and the authorized capital of the company was not sufficient to take care of necessary enlargement of its operations. This led to the organization of the new company, with larger and fresh capital and increased business rights. Mr. L. E. Parent is a young man, 38 years of age, who has devoted all his time for the past sixteen years to the lumber business in the Laurentian Mountain districts. He has been mayor of Ste-Agathe des Monts for many years and has devoted a great deal of successful effort to the development of the town.

Good Outlook for Hardwood Trade

Editor Canada Lumberman:—

Buffalo, N.Y., Jan. 13th.

Trade in hardwoods in the Eastern States was quite satisfactory and at good prices, up to the latter part of the year 1913, when business began to drop off slowly, with every other kind of business in the States, and naturally along toward the 1st of January, people wish to take inventory, and stocks were run down as low as possible.

Hardwoods are beginning to move now, and we believe that by the middle of February or the first of March, we will see hardwoods moving in quite a normal way, and at fairly satisfactory prices.

We are unable to see a great surplus of any kind of hardwood in sight at this time.

The new currency bill which has recently become a law in the United States, will have a very beneficial effect on business and will give confidence to the business people, and bankers throughout the entire country.

The tariff bill is now settled, and people are beginning to settle down to business.

From our observations we think people are feeling encouraged and have confidence in the future. We believe the latter half of 1914 will see business in quite a satisfactory condition.—Buffalo Hardwood Lumber Company.

A Curious Yellow Pine Development

In the face of all the discussion which has occurred in Canada of late regarding the dumping of yellow pine upon the Canadian market, at prices far below the cost of production, Canadian lumbermen will be surprised to learn that the State of Missouri has recently succeeded in the proceedings brought against a number of yellow pine manufacturers carrying on business in that State, who were charged with forming a combination for the purpose of fixing the price of their products, lessening the freedom of competition, and, in other ways causing damage to the purchasing public of that state. The decision recently handed out in the case against the Arkansas Lumber Company et al., is a most remarkable one and is looked upon as establishing some very important legal precedents. Whether the decision will stand the test of appeals which are certain to be brought, remains to be seen. It is sufficiently alarming, however, to the lumber manufacturers concerned, and probably to other manufacturers in the State of Missouri, to learn that a great industry, which has of late years, been notorious for sacrificing its stocks in all markets, at prices below the cost of production, can be found guilty of conspiring to maintain prices illegally. If the situation were merely one involving a verdict and a possible fine, it might not be so very serious, but those who have been found guilty in this case are fined various large amounts ranging from \$1,000 to \$50,000, presumably according to the degree of guilt, and the decision involves also forfeiture of all their corporate rights, privileges and franchises in the State of Missouri. The decision concludes, however, with a recommendation that the ends of justice will be obtained in regard to most of the cases, if only the fines are paid and a stay of execution is granted in connection with the forfeiture of their privileges, franchises, etc., pending a further order of the court. In connection with five companies operating in the State of Missouri under licenses only, the recommendation is made that their licenses be cancelled and they are also to be fined various sums ranging from \$1,000 to \$50,000, with a similar recommendation regarding a stay of execution in connection with the forfeiture of licenses, thus leaving them subject only to the fine.

The total amount of the fines involved under this decision is \$436,000. Leading business men in Kansas City and St. Louis seem to be unanimous in the opinion that the situation is both absurd and critical. Unless the decision of the supreme court is amended or annulled at the rehearing, the result will be that several of the leading yellow pine lumber companies will have to move from the State and others will be obliged to pay very heavy fines. A demand is being made by business men for the annulment of the antitrust law under which the proceedings were instituted, as they do not look with approval upon the prospect of the removal from the State of so many important business interests. It is calculated that the yellow pine companies' business alone means to Kansas City, 2,500,000,000 feet or in value \$40,000,000, and the employment of several hundred persons.

Not the least interesting peculiarity of the situation is the fact that it involves such men as Captain J. B. White, Mr. R. A. Long and others in the lumber business, whose reputations as men of the highest business and moral type are national, and regarding whom everyone knows that they would not have violated any law, antitrust or other, had they understood its meaning. It appears like an irony of business fate that these men who have done so much to build up the industrial prominence of their State and who have suffered so much on account of the uncertainty arising out of business depression, should be found guilty on such a charge. In their eyes the greatest "restraint of trade" is the doubt under which they have labored as to the meaning of the law in business, growing out of the widespread movement in the direction of prosecution of business corporations.

Canadians are not in a position to take sides one way or another in a matter of this nature, but they will certainly be surprised to learn that the prices of yellow pine in any market have been maintained by the manufacturers in such a way as to render them guilty of a charge of "restraint of trade." So far as Canadians can see, the boot is probably on the other foot.

New Brunswick Lumber Industry Expanding

The importance of the lumber industry to St. John and the province of New Brunswick generally is shown by the extent of the exports for the year 1913. While there has been some falling off in the quantity of lumber cut during the last few years, it has been due to market conditions instead of to any falling off in the available sources of supply. Spruce is still king, but some pine is cut, as well as hemlock and cedar, and a considerable quantity of hardwood. The new Transcontinental Railway, and the Intercolonial Railway which runs across the northern part of the province, have opened up very valuable sections of hardwood timber, including birch, maple and beech. There are fine opportunities along the new railways for the establishment of industries requiring hardwood as their raw material. The total exports of lumber from New Brunswick to trans-Atlantic ports last year was 270,000,000 feet, of which over 86,500,000 feet was shipped from

the port of St. John. There were also large shipments to the United States, some by water and some by rail. The shipments from St. John to the American market for the year were valued at \$1,527,000. The quantity of pulp shipped from St. John to that market for the year was valued at over \$328,000, and the pulpwood at over \$83,000. There is a growing trade in New Brunswick lumber with the Montreal district and eastern Ontario, and during last year, when other markets were dull, this was an important branch of the trade in the northern section of the province. One of the very important industrial developments of New Brunswick in coming years will be the establishment of factories to utilize lumber which is now shipped in such large quantities in the rough state to outside markets, there to be manufactured into articles of use.

B. C.'s Forest Development

Mr. H. R. MacMillan, chief forester for British Columbia, speaking of the forest revenue of the province, in a recent interview, said that the receipts for 1913 were the largest ever received in a single year by any province of Canada. The total was nearly \$3,000,000 or approximately \$27 for each inhabitant. British Columbia is the only province in Canada, he said, which is not over-cutting her forests. I believe that the forest revenue will increase largely from year to year as the markets for our timber develop and the logging operations which are now merely on the fringe of the forests are expanded, until our annual cut keeps pace with the normal forest growth. The estimates of an even greater revenue in the future are based upon surveys of timber wealth of the province which have been continued during the year by the forest branch. These surveys have shown that our timber wealth is by no means confined to the coast district and the southern interior, but that in the northern interior, which is now being opened by new railroads, there are large areas of timber of a better average quality than is to be found in the stands that constitute the chief forest resources of Ontario and Quebec.

The forests of this province, if protected from fire, will, I am confident, form the basis of a future industry of such magnitude that the most optimistic cannot grasp its possibilities to-day, possibilities which will assuredly develop under the creation of new markets on the northern prairies and in northern British Columbia. Negotiations are now under way which will lead to an increase in revenue from timber royalties. A marked advance was made during the year in protecting the forests of the province from fire. The sources of fire danger were carefully studied, and arrangements were made before the fire season opened to provide an adequate patrol to control possible outbreaks. As a result of this policy the province had a record season so far as the minimum fire damage in its forests is concerned. Of the 600 fires which occurred during the season, seventy-two per cent. were extinguished by patrolmen. The cost of extinguishing those fires which got beyond control of the fire patrols was only \$9,000, as compared with \$30,000 for the previous year, which itself set a low record for many years.

The great wealth of our forests requires that even greater fire precautions must be taken in the coming years to prevent destruction by fires arising from increased settlement and railroad construction. In order to improve facilities for fire protection, and to render the fire patrol service more effective, 1,200 miles of trails and 360 miles of telephone lines were built by the forest rangers and forest guards during the past season. The value of these improvements will be an even increasing asset in the coming years.

The value of the forest products of British Columbia for 1913 exceeded that of all previous years, amounting to approximately \$30,000,000. For the first time in the history of British Columbia the timber industry has ranked with the production of minerals as the chief wealth-producer in the province. The annual value of forest products of British Columbia exceeds that of all other provinces in the Dominion, with the exception of Ontario. In its importance to the people of the province the lumber industry has, during 1913, passed all its competitors. The 794 logging operations and 350 lumber and shingle mills employ over 50 per cent. of the total number of wage earners employed in the industries of British Columbia.

Lower Rates to Canada

The Soo Line and Canadian Pacific have published, effective February 1, substantial reductions in rates on hardwood lumber in carload lots to points in Western Canada, known as "trade centers," from Minneapolis and St. Paul and Minnesota Transfer. These are basing points for making through rates to Western Canada points. As an illustration, the present rate from basing points shown to Winnipeg and St. Boniface, Man., is 20 cents per 100 pounds, while the new rate will be 17 cents. To Portage la Prairie, Man., present rate 22 cents, will be 17½ cents. To Regina, Sask., present rate 35 cents, will be 31 cents. To Saskatoon, Sask., present rate, 43 cents, will be 37 cents. To Moose Jaw, Sask., present rate 39 cents, will be 33½ cents. To Calgary, Alta., and Edmonton, Alta., present rate, 54 cents, will be 44 cents.

The Proper Use of Belts

Much useful information in regard to the use of belts is contained in a handy belting manual issued by the Graton & Knight Manufacturing Company, Worcester, Mass. Referring to the tightness of a belt the manual says:—The tightness with which the belts are put on the pulleys is of fundamental importance. If too tight there is a large unnecessary loss of power from excessive friction at the bearings, to say nothing of the fact that the leather is over-strained and injured. On the other hand, if too loose, the belt is liable to flop around and jump from the pulleys, particularly when working where a load is suddenly thrown on or off. When the belts are put on and taken up under the direction of one man, the errors of too tight and too slack belting are avoided and a uniformity of belt tension exists throughout the factory which can be obtained in no other way. Of course, it is evident that the slacker a belt can be run, up to a certain point, and do its work satisfactorily, the greater the economy will be. In installing belting and taking it up, consideration must be given to the fact that certain kinds of belting are affected by weather conditions, lengthening and shortening according to the amount of moisture in the air. This is particularly true of certain makes of chrome leather belting, and instances have been known where babbitt has been melted out of boxes, or even shafting has been pulled down, as a result of such belting having been put on too tight.

Shafting in Line

On the subject of shafting the manual says:—Be sure to note carefully whether your shafting is properly in line. Probably more belting is ruined by improperly lined shafting and pulleys than in any other way. The belts, under this condition, are either kept on the pulleys by guides or rub against hangers or portions of machines until a lap is started open, thus catching the belt and tearing it or stretching it excessively on one edge. Belts so stretched will not run straight and are apt to run off the pulleys and become torn.

Remember that, because shafting was once in line, it does not follow that it stays so indefinitely.

Changing loads on the floor is apt to put shafting out of line. Frequent inspection of shafting for alignment is always rewarded by a large saving in the friction load.

In all replacements, as well as in the original installment, initial economy should not be the only thought. It is a very simple matter to connect two pulleys by a band in such a way that when one pulley is turned the other will go round. It is not at all a simple matter to proportion a drive properly and to select the size and quality of belting which will transmit power most efficiently and economically. Yet the problem seems so simple that it more frequently than not fails to receive the necessary consideration, and a common result is that belting is condemned when really the man should be condemned who asks the belt to work under given conditions. Most belt troubles would never appear if the design and installation of the belt equipment were placed in competent hands. It may be stated as a general rule that the use of the best quality belting, of weight and pliability adapted to the work required, will pay good dividends in lessened repairs, increased life of belting and increased output of machines. The usual tendency is to employ a single belt, which is too light, and a double belt, which is too heavy for the work required.

To Secure the Best Results

Single belts should be put on so as to run with the grain, or hair side, next to the pulleys, and so the points of the laps will run against the pulleys, as the laps on the outside of a belt are most liable to come apart when the points are run against the atmospheric pressure.

Double belts should be put on so that the points of the laps will run with the pulleys, as both sides point in the same direction.

For quarter-turn belts the details of the drive must be analyzed. The belts must be specially constructed to give satisfactory service. A quarter-turn drive without an idler requires a differently constructed belt from one with an idler.

For quarter-turn drive without idler, the pulleys must be set so that the point where the belt leaves the upper or driving pulley and the point where the belt leaves the lower or driven pulley must be in a plumb line. In this arrangement the belt can be run in only one direction. Any attempt to drive the belt in the reverse direction will result in its being thrown from the pulleys and probably ruined.

On quarter-turn belts specially constructed for drive without idler, one edge is marked as follows:—"Run this edge on long side of the drive." This edge must run on the longer side of the drive to give satisfactory results.

Location of Shafts from Pulleys

Care should be exercised in locating shafts so that they are not too near together; there should be distance enough between them to allow the belt to recover somewhat from the strain applied on the

tight or working side. This distance depends entirely upon the size of the belts and pulleys, but should be sufficient to allow some slight sag to the slack side of the belt. It is also injurious if the shafts are too far apart, for, in such cases, the weight of the belt draws heavily upon the shafting and increases the friction load in the bearings. At the same time it causes the belt to swing from side to side, frequently to such an extent that it nearly runs off the pulleys. This constant swinging from side to side is also a frequent cause of crooked spots developing in belting. If possible, the shafting and machinery should be so installed that the tight side of the belt is at the bottom, so that whatever sag there may be in the belt will tend to increase the arc of contact on the pulleys.

It is the best and most economical practice to use pulleys of large diameter, thus obtaining a high belt speed, which means a saving both in the transmission of power and the wear and tear of the equipment.

The speed of the belt being the same, the diameter of the pulley has a slight effect on the amount of power transmitted, the difference being in favor of pulleys of large diameter.

The speed of the shaft being the same, the advantage in favor of large pulleys over small pulleys is in proportion to their diameters.

Covering pulleys with leather reduces the slipping of belts and also decreases the friction losses in belt driven transmission by making it unnecessary to run the belts so tight. It is estimated that leather covered pulleys will enable belting to transmit thirty per cent. more power than pulleys with the plain iron surface.

How to Cover Pulleys with Leather

Be certain that the pulley is absolutely free from grease by washing it with naphtha, gasoline or some similar material. Be sure that the pulley is reasonably warm and dry. Where possible, make the cover endless, about one-eighth of an inch to the foot shorter than the circumference of the pulley. Place the endless cover on the pulley, pushing it on, say one inch or more, then thoroughly glue the exposed inside surface of the cover and the exposed outside surface of the pulley, being sure that the glue is very hot, but not boiling, and not too thick; rub the cement thoroughly into the leather and also onto the pulley. As soon as you have these surfaces glued take the pulley by the spokes and drive the cover on by striking it on the floor bench. Do this as quickly as possible, but carefully, for if you strike too hard it will bend the leather so that it will be impossible to drive it on. If it sticks a little, use a screw driver between the cover and the pulley and force it down, using the screw driver as a lever.

As soon as the cover is completely on, thoroughly rub the edges of the cover with a round hickory stick, or handle of some kind, so as to make a good contact between it and the edge of the pulley. This serves to work out the air and surplus glue.

An experienced man can cover a pulley in this manner so tight that it will not need rivets, although it is customary as a matter of safety to use a few copper rivets.

Let the pulley set two or three hours before using.

We have tried to offer a few suggestions for the proper care of belting, and we may summarize these briefly as follows:—

Place the belting in charge of one man.

See that he knows his business and attends to it.

Have all belting periodically inspected.

Remedy all faults in their early stage.

Keep all driving surfaces clean.

Put grease into too dry belting.

Take grease out of too oily belting.

Avoid sticky dressings.

Run all belting at as nearly as practicable a uniform tension.

Run belts as slack as they will work efficiently.

Keep all shafting rigidly in line.

Compensation Proposed for River Drivers

In the Quebec Legislature, Mr. Cannon, member for Dorchester, recently proposed the extension of the Compensation Act to men in lumber camps and those employed in floating logs down rivers. By judicial decisions these men are now outside the act. Mr. Tellier, leader of the opposition, thought that when a man took the risk of his life, even for a small jobber in the employ of a farmer, and was injured, his family should be recompensed for the loss, temporary or total, of the bread-winner. It was true that this kind of logging would not come under the head of commercial accidents, but when an accident occurred the loss was just as great in a big as in a small company. The Minister of Public Works said that the suggestion of Mr. Tellier was too far-reaching, as if adopted, any farmer having engaged a couple of men for cutting down trees, in the event of an accident would become responsible for damages. Mr. Tellier believed that no restriction on the kind of employer should be made.

The Reader's Viewpoint on Trade Topics

Opinions on Questions of General Interest—How to Replace a Pulley Key—
Saws That Are Too Thin

Removing and Replacing a Pulley Key

Editor Canada Lumberman:

I intended sending you a short contribution regarding my experience in the application of power to mill machinery, but owing to another subject that attracted my notice, I leave it over for a future writing.

A recent number of a machinery journal contains an article in which is handed out—free of charge—a method of removing keys, and fitting keys to pulleys on shafts.

It must be evident to any mechanic who has read the article, that the writer could not be entrusted with the performance of the operation he undertakes to explain.

The removal of a key from an iron pulley fastened to a shaft, or adjusting a key in a pulley—or any other wheel—is an operation so familiar to machine men and mill men in general, that the subject is seldom, or never, treated in print, and I should not have taken up the subject, were it not for the feeling that the article referred to might mislead younger men of less experience.

The adjusting, or fitting of keys for holding pulleys, couplings, etc., to their proper positions, is very rarely done at the mill. This work is, with a few exceptions, finished at the shop, but it sometimes occurs that an old pulley must be placed on a new shaft or vice-versa, in which case it is up to the millwright to do the work, or have it done by a competent man.

For our present purpose let us assume that there is a key, that requires readjusting, in a pulley on the main shaft of the mill. It was noticed last fall just before the mill shut down, and although it was driven with a sledge, yet there is a doubt as to its security and it may

play a trick next summer. To readjust it properly it is absolutely necessary that the key be taken out for examination, and this is where experience counts.

The man assigned to do the work may not have had an apprenticeship in the machine shop; nor be much of a mechanic, but he knows something of the work he has in hand, and can be entrusted with it.

Our man will make a good stout drift or have one forged by the blacksmith. This will exactly fit the point, or small end, of the key and is drawn out for about $1\frac{1}{2}$ in. in length. The full length of the drift may be about 8 in., and it will be made of 1 in. octagon or round cast steel. I enclose a sketch of the drift to illustrate my idea more plainly.

Next a 12-pound sledge is secured and a pair of tongs to hold the drift and a man to hold the tongs. To take a position to give a good blow with the sledge, is the next step—not a swinging blow. The striker strikes a couple of light blows—aims as it were—and then lets go a good solid drive. He knows by the sound that the key did not budge. The same operation is repeated three or four, or perhaps twenty times, but the man does not mind. He has been at this before. At last the sound changes. The key has started back and our man heaves a sigh of satisfaction. The rest is easy. The key is driven back as far as the drift will send it. A follower is brought into requisition, and the key is driven out.

But why did the key work loose? It was a bad fit, it was bearing hard at the big end and not touching at the small end. This is why it would not hold.

A key should always bear hard at the small end if it is to be held secure.

The question of refitting the same key or making a new one comes next. This is soon decided upon. It may be easier to forge a new key

than try refitting the old one, in which case a pattern is made to fit exactly in the key seat, the blacksmith forges a key of the dimensions of the pattern, leaving just a little over for filing—for there is no iron planer within a hundred miles. The operation takes a little time, but this is expected under present conditions, and there is no complaint. We will buy an old planer and perhaps a lathe next year.—W. Marsh.

Charges Bank Interest After Due Date

D. M. Heise, retail lumber dealer, Stouffville, Ont., when in Toronto recently, visited the Canada Lumberman and reported a good outlook for business next spring. Mr. Heise, by progressive business methods, managed to secure a satisfactory amount of business even during the recent dull months. Side-lines such as patent roofing, cement, etc., had much to do with this, as Mr. Heise believes in stocking as wide a variety of materials as possible, so that the customer who is doing some building can buy nearly everything he requires at the one place. He does not push the side-lines to the same extent as the lumber, but if a man has his mind made up to buy a patent roofing or some other such material instead of using wood, Mr. Heise believes in being the man to sell it.

Following up collections closely, going out systematically after new business and being as useful as possible to customers, are some of the other factors in Mr. Heise's success. Some time ago he decided to adopt the practice of charging bank interest on accounts, after the due date. It took some time to educate the customers, but in the end, all the really desirable customers fell in with the plan and it is now working well, as accounts are paid up promptly in nearly every case. There are occasions, of course, when the rule is not followed so strictly. In the winter for instance, when the sleighing is good, and a farmer's teams are not so busy as in the spring, Mr. Heise allows farmers to make purchases and draw away the stock, but does not count the sale as being made until about the time the farmer would be requiring the stock in the spring. The bank rate of interest is not charged until a month after the opening of spring. This is a reasonable arrangement, as it enables the dealer to move his stock out steadily. It simply amounts to this, that the farmer stores the stock during the winter months and the dealer is sure of his sale. He is also sure of keeping the farmer's trade, as a result of having extended so useful a privilege.

A Good Outlook for Trade at Belleville

Editor Canada Lumberman: Belleville, Ont., February 5th.

Building is very nearly at a standstill, and has been since the end of the year. The yards have about the average stocks on hand, and everybody seems optimistic about what spring will bring. There will be a good deal of government work here, new docks, new fish hatcheries, and the completion of the dormitories at the school for the deaf. There will be the railway construction and the station buildings in connection therewith. So, with the usual building trade, and a good farming community always requiring materials, prospects never looked much better.

A drawback to all business is poor collections. This has been our experience during 1913 and there is little change as yet. Local establishments are carrying more paper under discount than a year ago, a great deal of the paper being about a year old.

Summing up conditions. We would say that the year 1914 seems to be opening up with brightest prospects for the trade generally. There is every indication of a bigger and better year.—The Holton Lumber Company, Limited.

Accuracy in Timber Estimating

Editor Canada Lumberman: Old Town, Maine, January 9th.

I feel that somewhat of an apology is due you for infringing on your space to the extent I have in getting Mr. R. Sweezy to acknowledge that the term "absolute accuracy" as used in an advertisement of that company, in reality meant "relative accuracy," but as Mr. Sweezy thoroughly so explains his inadvertent phrase in your issue of the 1st inst., possibly the space used will not be unprofitable to readers, nor to Mr. Sweezy.

I do not wish to take up your space further by a detailed discussion of methods of estimating. These vary with conditions and requirements. Sometimes with certain species calipers are used; at other times not. Hard and fast methods cannot be insisted on, but must be varied as experience and wished for results command. The

other questions Mr. Swezey asks may best be answered by reference to various text books and pamphlets, especially to Mr. Graves' "Forest Mensuration," and to Mr. Cary's "Manual for Northern Woodsmen." I do not think it necessary to encumber your columns with any further answers.

I will state, however, that the use of height classes and diameters form a satisfactory method of doing work in certain species; that the usual way of arriving at heights is to obtain an average height for each diameter by observation and measurement of a sufficient number of trees to warrant that average. The mechanical part of measurement is done very simply, instrumentally, and I refer Mr. Swezey to the text books above mentioned for information, or will be glad to write to him personally explaining the method if he wishes.

I will, however, take exception to one statement in Mr. Swezey's letter of the 16th, viz., that I have suggested methods in timber cruising during this correspondence. I have not intentionally so done, as it seems to me far better to remain on the point at issue which in this case was the impossibility of absolutely accurate timber estimates at a cost of 1 cent to 4 cents per acre.—James W. Sewall.

Editors note:—The above reply by Mr. Sewall to Mr. Swezey, seems to bring this interesting correspondence to a mutually satisfactory conclusion. Mr. Sewall's letter contained further material of a contentious nature, which he kindly left at our discretion to publish or omit. The question has been well discussed already, however, and we hope that it has been of interest and value to our readers as well as to the writers.

The Use of Saws That Are Too Thin

Editor Canada Lumberman: Westboro, Ont., Feb. 2nd.

Referring to the use of saws used by the lumbermen in our country, I am firmly convinced that many of them are wasting lumber, by striving to operate saws to thin. We will take a 14 gauge saw, which is by rule measure, 1-12 in. thick, or 2-24 in. thick, and give it 1-16 in. set, by spreading the teeth to that width. The whole width being three and one-half twenty-fourths inches, of a kerf. If a band saw and carriage is used, the boards cut would require to be set out to $1\frac{1}{8}$ in., if to be dressed to 1 in. thick. This thickness of $1\frac{1}{8}$ in. becomes necessary as the variations of the saw along with the lost motion of the different parts of the complicated machinery, required in the construction of the carriage, make it absolutely necessary, for we may note, that $\frac{1}{8}$ in. variation in a band saw, either into the log or out of it, is not at all unusual. Ask any good sawyer. And what makes matters worse, is the fact that band saws so often score the lumber, if the plate and teeth of the saws are not in perfect order, or alignment.

We will now leave the band taking three and one-half twenty-fourths, for one board, and take a saw 11 gauge thick, which is by rule measurement, $\frac{1}{8}$ in. thick, or 3-24 in. thick. And spread the points of the teeth 1-16 in. or $1\frac{1}{2}$ twenty-fourths of an inch, making four and one-half twenty-fourths, or 1-24 in. thicker than the 14 gauge saw. But by a better design of a machine, along with the thicker saw, we are in a position to cut the boards 1-16 in. thick. We save the difference between 1-24 in. and 1-16 in. by the use of the thicker saw, and make the lumber all merchantable. Some might say that the saving is not worth mentioning. But we fail to see the advantage of trying to save lumber in the saw mill, and planing it off in the planing mill, or making planer chips instead of saw dust. And there must be a saving in freight when the boards are shipped rough, as nearly 1000 feet more can be loaded on a car. In the above I do not wish to be understood as condemning the band saw and carriage, for all purposes; far from it. I believe it to be the best for cutting defective, and large logs, if properly operated, but for small sound, and knotty rough logs, I have no hesitation in saying, the thicker saw is very much the best.—I. N. Kendall.

A Cash Business the Right One

Editor Canada Lumberman: Bowmanville, Ont., Feb. 7th.

It is rather early yet to make any kind of accurate report, or even estimate, on trade conditions for the coming season, but, as far as we can judge at present, there is not likely to be any considerable amount of building in the town. However, we have had a few inquiries from farmers and we hope to do our usual amount of trade with them.

With reference to collections, we are finding this the most difficult part of our business to handle, and are being more firmly convinced every day that a cash basis is the only satisfactory one upon which to do anything like a profitable business.

"Small profits and quick returns," is not only a good maxim but an excellent business proposition as well.—McClellan & Company, Limited.

A Fair Trade Expected at Newmarket

Editor Canada Lumberman: Newmarket, Ont., Feb. 7th.

I cannot see how the building trade this year can equal that of the past year. In my observation I find that most towns and villages have a few vacant houses, and factories in general are running either with a reduced number of men or on short time, which is not a bright

outlook for speculative builders who look for a ready sale. I also find that some men are leaving town and going back to the farms. All these conditions combined make me of the opinion that trade will only be fair for the coming summer. The outlook for the building trade in our town and district, seems very favorable for this year, and we are figuring on a good season's business.—W. H. Eves.

Healthier Business at Hamilton

Editor Canada Lumberman: Hamilton, Ont., Feb. 5th.

It is a little difficult to make any accurate business forecast at present as this has been a most unusual year so far. However, present indications seem all to point to a renewed activity in building operations in the early spring, or as soon as the weather will permit. Business is still a little dull, as the market has not yet recovered its former confidence. The situation on the whole is decidedly optimistic, and, if trade is not quite up to the early spring of 1913, it will undoubtedly be of a more healthy nature.—The Consumers Lumber Company, Limited.

Prospects are Good at Hamilton

Editor Canada Lumberman: Hamilton, Ont., February 5th.

Business is very quiet at present in the building trade. Most of the yards and mills are on short time and short-handed.

There is every prospect, however, that we will have a good season's business, as the architects report that they are getting busy on plans for new buildings which are contemplated.

Stocks on hand are about average size for this time of the year and collections are nearly up to, if not as good as, last year.—D. Aitchison & Company.

Collections Fairly Well Met

Editor Canada Lumberman: Almonte, Ont., Feb. 5.

The outlook for trade is scarcely up to the average. It is better in the town, but not so good in the neighboring country. Collections are fairly well met. Stocks are below the average in yards and local mills, aside from those on the Ottawa River.

So far as any reasonable estimate can be made, the outlook here is less promising than it was a year ago. However, the actual conditions will be better known with the opening of spring.—W. N. Acton.

Collections Fair but Past Due Accounts Still Evident

Editor Canada Lumberman: Brantford, Ont., Feb. 7th.

We have just as large a stock on hand as we had a year ago. Collections are fairly good, though we are carrying some past due accounts. Building prospects in this locality are not so good, though there will be a large quantity of the smaller classes of buildings.—The Schultz Bros. Company, Limited.

Expecting Trade to be Active and Good

Editor Canada Lumberman: Burlington, Ont., Feb. 6th.

We expect business this year in the retail trade to be as good as the early part of last year. Everything seems to indicate that the crisis is past and that the retail business is back to normal. Our January sales exceed January of a year ago by about 25 per cent.—A. S. Nicholson & Company.

Trade Prospect Paragraphs from Our Readers

The general outlook for the lumber trade during 1914 is that it will experience a good steady business. Profits were about the same during 1913 as during 1912, but the price of lumber was \$1.11 greater than in the previous year. We find stocks larger now than a year ago.—The Saskatchewan Lumber Company, Limited, Crooked River, Sask.

Trade conditions are steady, but we look for nothing in the nature of a boom during 1914.—C. Beck Mfg. Company, Limited, Penetanguishene, Ont.

Lumber prices during 1913 were better than during 1912, but the costs of operations were also greater.—Highland Lumber Company, Berriedale, Ont.

The outlook for trade during 1914 looks better than during the greater part of 1913.—Kent-Cooper Company, Limited, Collingwood, Ont.

The outlook for trade during 1914 is good and will be still better if the money market opens up.—George Tennant, Bracebridge, Ont.

Trade conditions are slow at present, but we think they will be alright before long.—J. W. & J. Anderson, Burnt Church, N.B.

We consider that the outlook for trade during 1914 is very bright.—J. D. Shier Lumber Company, Limited, Bracebridge, Ont.

We consider the outlook for trade during 1914 to be fairly good.—Petawawa Lumber Company, Pembroke, Ont.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

Simonds Canada Company Enlarging its Factory

Foundations have already been completed for a large new building for the Simonds Canada Saw Company, Limited, at their plant, St. Remi Street and Acorn Avenue, Montreal, Que. The building will be of substantial brick construction, 170 feet long and three storeys high, and it is expected that it will be completed early in the summer. The growth of the business of Simonds Saws in Canada has been so regular and continuous that their present factory equipment in Montreal is working to full capacity. A new building will be necessary to take care of the increases during the next few years if the business continues to grow as rapidly as it has in the past few years.

A. R. Clarke & Co., Ltd., Have Nineteen Men on the Road

Nineteen experienced and well-known travellers will represent A. R. Clarke & Company, Limited, on the road this spring. Each traveller will have a full line of Clarke's well-known cold weather clothing, sheepskin-lined coats, mackinaw coats and pants, and ladies' fancy check mackinaw coats in a variety of patterns, and thoroughly up-to-date in cut and style. The lines of gloves, mitts, gauntlets and moccasins are well-known to the trade, but the company's past experience has enabled them to make many improvements upon what they offered last year, such as, the smelters mitts with wire sewn seam, gloves with double sewn finger tips, and many other useful improvements. The leather which enters into the manufacture of these goods is all manufactured in the company's tannery and has been improved until they claim that it is the best leather manufactured.

many new styles. All their shirts

In shirts, the company shows are double stitched and the buttons sewn on extra tight. Their new model lumbermen's shirt has met with much success. It is a general favorite in the lumber business.

Mr. T. H. Alice, of the company's Vancouver office, who has been with them for many years and is well-known to the merchants of British Columbia, will again represent the company. He will be assisted by his son, Mr. H. B. Alice, who promises to make as much of a success as his father.

Mr. R. M. Carey, of Edmonton, will again represent the company in Alberta. He is expecting a banner year.

Messrs. Thompson & Henselwood and their three assistants, of Saskatoon and Regina, will be going over the same route and visiting old friends this year in Saskatchewan.

Mr. J. McClure, of Winnipeg, is looking for splendid business with the merchants of Manitoba.

Mr. C. J. Pattinson, or "Pat" as he is known to every one in the trade, has a larger territory this year than ever. He will cover southern Manitoba and Western Ontario.

Mr. W. J. Gaynor, a newcomer with the company, has excellent recommendations and the company feel sure that their customers in northwest Ontario will give him a welcome.

Mr. D. D. Rose, the company's oldest and most respected traveller, will cover Northern Ontario again and is looking for larger business than ever.

Mr. Theo. Trickey, will call on the trade of eastern Ontario. Though only with the company for two seasons he has made an excellent record and is expecting to show a decided increase this year, as he did last year over the year preceding.

Messrs. Mackenzie & Stuart, who will call on the Ottawa Valley trade, are new to the company, but are counted upon for good results.

Messrs. E. N. Lavellee, of Montreal, and C. Morin, of Quebec, will represent the company in the ancient province.

Mr. Geo. D. Travis, is the company's farthest West traveller. He is known from one end of the Yukon to the other.

Messrs. W. N. Yetman and T. H. Kitchen, of Sydney, are the representatives in the Maritime Provinces. They have made a record as among the most capable and courteous men upon the road.

For Shifting Heavy Materials

Some very interesting recent installations of Morris Overhead Runways, are dealt with in Bulletin A-12 issued by The Herbert Morris Crane & Hoist Company, Limited, Empress Works, Peter Street, Toronto. Reproductions of photographs of these runways

Plant of A. R. Clarke & Co., Limited, Toronto

bear testimony to the flexibility and handiness of the system employed. The Morris Runway is shown in the warehouse, paper mill and foundry and the modifications of the equipment to suit varying conditions is shown in a very interesting way.

An Important New Swage

Mr. F. A. Breeze, one of the firm of Breeze, Denison & Company, Newburgh, Ont., has patented a swage which will roll out seven gauges of steel at one pull of the swage, the pressure being made with steel rollers that put a perfect point on the corner of a saw tooth with half the labor or less, that is necessary where a solid die scrapes out the steel to form the tooth point. Mr. F. A. Breeze is the sole inventor of the patent steel roller bearing carriage and patent steel band mill that has attracted so much attention of late.

A Valuable Remedy for Horses

A valuable remedy for use in stables, which has been increasing in popularity from year to year, is Absorbine. Leading trainers and horsemen are among the steadiest users of this well-known liniment. When a horse is cut or wounded, the owner naturally wants something which will heal the sore from the bottom. Absorbine, being a germicide and antiseptic of well-known merit, penetrates into the wound, kills the germ and promotes a rapid healing process. Owners of horses which are suffering from a wire cut, fistula, poll evil, or any burrowing sore should write to the manufacturers of Absorbine, W. F. Young, P.D.F., 424 Lymans Building, Montreal, who will furnish valuable advice regarding the treatment of any individual case. Absorbine is sold at \$2 a bottle at druggists or send direct, charges prepaid, upon receipt of price.

A New Box Board Matcher

The accompanying illustration represents a front view of a new box board matcher which has recently been placed upon the market by the Mereen-Johnson Machine Company, Minneapolis, Minn., U.S.A. These machines have been given operating tests for approximately three months, so that the company is placing them upon the market with every confidence in their capacity. They claim that the only practical limit to the amount of short lumber this machine will tongue and groove is the ability of the operator to feed in the stock. The matcher is ordinarily furnished with cone pulleys, giving a rate of feed of 85 feet per minute, or 140 feet per minute. It is equipped with eight pairs of driven feed rolls, two pairs in front of each cutter and two pairs behind. The rolls are 4 inches in diameter. The first and second pairs are $4\frac{1}{4}$ inches between centres. The second and third over the cutters are $5\frac{1}{2}$ inches between centres, and third and fourth are $4\frac{1}{4}$ inches between centres, making a total distance of only 14 inches from first to last roll, which gives the best possible support to short or warped stock. Each feed roll can be adjusted independent of all others, so that an operator with little experience can keep them in alignment. The equipment includes one pair of patent cutters which do smooth work on knotty or cross grained lumber. The sawdust is conveyed to the rear of the matcher through cast iron pipes feeding closely under the cutters. The company will also furnish, when ordered, a gluing device, with an adjustable glue wheel, which can be kept in line with the cutters until they are worn out. This device is ordinarily tapped for steam connections. A similar device, fitted for electric current, can also be supplied by the company.

The countershaft is directly connected to the frame. The T. & L. pulleys 8-in. x 5-in., are designed to run 890 revolutions per min-

New Mereen-Johnson Box-Board Matcher

ute. The machine requires 5 h.p., has a shipping weight of 2,200 pounds and occupies a floor space of 3 ft. 6 in. x 5 ft. 3 in.

The address of the Mereen-Johnson Machine Company is 44th Ave. N. and Lyndale, Minneapolis, Minnesota, U.S.A.

National Wholesalers Will Have Good Meeting

Arrangements for the twenty-second annual meeting of the National Wholesale Lumber Dealers' Association to be held in Buffalo N.Y., at the Iroquois Hotel, on March 4th and 5th, are progressing and the indications are that there will be a very large meeting. Replies from invitations to the various trade organizations show that the representation will be general, not only from the wholesale and retail associations, but also from the National Conservation Association, American Forestry Association and the Railway Business Association and others. The annual banquet of the association will be held at the Iroquois Hotel on Thursday evening, March 5th at 7 o'clock.

Increasing Imports from United States

Canada's imports of lumber free of duty from the United States under the heading of "sawed or split boards, planks, deals and other lumber not further manufactured than dressed on one side only" during the year 1913 totalled 382,774,000 feet B.M., valued at \$6,087,560. Compared with 1912 this was an increase of about 4,500,000 feet in quantity and \$1,102,823 in value. Compared with previous years these imports show a remarkable increase. In 1911 the total quantity was 193,177,000 feet; in 1910, 84,666,000 feet, and in 1909, 50,811,000

feet. The imports for 1913 under this head were therefore more than seven and one-half times as great as during 1909.

Imports of pitch pine during 1913 free of duty amounted to 118,868,000 feet, valued at \$2,435,376. These imports also show remarkable increases. The total quantities for previous years being as follows:—1912, 91,441,000 feet; 1911, 94,048,000 feet; 1910, 42,341,000 feet; 1909, 42,317,000 feet.

Imports of wood pulp during 1913 and previous years were as follows:—1913, \$2,713,226; 1912, \$1,858,831; 1911, \$1,470,638; 1910, \$1,052,400; 1909, \$770,412. The total value of imports of wood and manufactures of wood free of duty from the United States during 1913 was \$19,184,547, an increase of nearly \$5,000,000 as compared with 1912 when the total value was \$14,398,289 and over three times as great as the value under the same heading for 1909, which was \$6,147,249. Dutiable imports of wood and manufactures of wood from the United States during 1913 were valued at \$8,175,008 as compared with \$5,315,493 during the corresponding period of 1912.

Personal and Trade News

The late Hon. John Sharples, of Quebec, left an estate valued at \$779,456. Aside from a number of legacies, which total about \$79,000, the rest of the estate goes to his wife.

The Long Lumber Company, Hamilton, Ont., have sent out to the trade as a souvenir a very striking colored picture of a bull dog's head, mounted upon a large brown board.

Mr. F. Haimberger, VIII Langegasse 63, Vienna, Austria, is on a visit to this country, looking into the pulp and paper trade outlook, preparatory to making arrangements for the introduction of Austrian pulp machinery.

Reports from Northern Ontario state that heavy snow falls prevailed in many parts of the north country on February 7 and 8. Cold weather accompanied the snow and made operating conditions in the woods much more favorable than they had previously been.

Mr. James Barry, sawmill manager at Renfrew for M. J. O'Brien, railway contractor, has purchased three of Breeze, Denison & Company's patent band sawmills, in two instances removing circular mills to make room for the band. He claims to gain one board on five in inch lumber, over the circular mills.

At the annual meeting of the Nicolet Falls Pulp and Lumber Company, held at Danville, P.Q., the following officers and directors were elected: Mr. F. McCrae, M.P., president; Mr. John Quinn, vice-president; Mr. Lamoureux, secretary; Messrs. E. W. Tobin, M.P., J. A. Crepeau, L. Hannan, Jos. Lepine, H. Girard, directors; and Mr. E. Rocket, treasurer and manager.

Wm. Copping, lumber manufacturer and exporter, Joliette, P.Q., has sent out an attractive calendar for the year 1914. A composite picture, in half-tone, is shown, representing various stages in the marketing and conversion of lumber. These include a cruising scene, a logging scene, a sawing scene in the mill, a typical lumber yard scene, and, in the centre, an illustration of an attractive house largely constructed of lumber.

Mr. Arthur Rushforth, managing director of the Dominion Mahogany and Veneer Company, Limited, Montreal, has resigned his position with the company on account of extensive interests in England, and Mr. George Kersley, the manager of the concern, has been appointed managing director in his stead. Mr. Kersley has had extensive experience in the mahogany and veneer business in both the European and American markets.

At the annual meeting of the Papineauville Lumber Company, held at Papineauville, P.Q., it was reported that the company had a very satisfactory year during 1913, there being an increase in business and profits. It was decided to erect a mill to manufacture hardwood veneers for cooperage and cheese boxes. The following officers were elected: President and manager, Mr. T. Bonhomme; secretary, Mr. H. J. Tetreau; directors, Messrs. T. Bonhomme, A. St. Amant, and J. S. Bock.

The Colonial Lumber Company, whose plant is located at Gillis Cove, Antigonish, N.S., have now over 1,000,000 feet of logs in their boom and a large quantity ready to be brought down in the spring. They will be ready to commence operations at their large sawmills and woodworking plant early in the spring. At present the company are giving employment to over sixty men and will have twice that number when their sawing operations commence.

Mr. W. J. MacBeth, formerly with the Fesserton Timber Company, Toronto, and who for many years previous to that was sales manager for the Parry Sound Lumber Company, has opened a wholesale lumber business on his own account at Toronto, with office at 60 Brock Ave. Mr. MacBeth is open to handle stocks on a straight commission basis for manufacturers who wish to place their stocks upon the market in that way. He has also made good connections with producers of Southern pine and is placing this stock upon Ontario markets.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Toronto, January 19th, 1914.

Near Dimension

A sawmill was cutting veneer fitches whenever suitable timber was secured, and was making some quartered oak lumber as an incident thereto, says the Hardwood Record. Sometimes when the grain was not running straight the sawyer would have on end of a fitch blocked out considerably in edging to get straighter grain in the veneer, and this would make a tapering, triangular piece. Often in the final running of a fitch the sawyer would chalk it for cross cutting, maybe two or three feet from one end, and at times both ends. Quite a large

pile of these ends had accumulated, running in length from two to nearly four feet, in thickness from two to four inches, and in width from six to twelve inches.

"What do you do with those short ends from the fitches?" was asked of the millman.

"I am just wanting to know what to do with them," the millman replied. "When they are four feet or longer I can put them back on the carriage and run them into short lumber, but below four feet they are too short to handle on the mill, and I don't know just what to do with them."

It was then suggested to him that they were good material for making small dimension stock for the furniture trade, but the idea didn't sound good to him because he had never found it was possible to realize a good enough price for such stock to make its manufacture worth while.

The same mill was working out and trimming up the boards and triangular pieces incident to sawing the fitches, and from these there were a lot of edgings and end trimmings that went over to the cross-cut saw and from there down to the woodpile. These and the ends made enough good quartered oak to have started a fair assortment of small dimension stock, and, besides, the process of sawing other oak logs yielded plain oak trimmings that could certainly be used in the same work.

The shorts from the fitches could have been worked into barrel heading by the addition of a special short log mill for that work. But it does not seem good policy to use them for that purpose when there is just as much need for shorts and dimension stock in the furniture trade as there is for heading in the barrel business.

It was enough to make one feel a bit peevish to see those shorts in fine, thick quartered oak, with only a knot here and there to mar the perfection, which could easily be worked out in reducing to small dimensions. When one considers that those needing such thick stock as barber chair arms can get it by gluing up several thicknesses of one-inch short lumber, the claim that there is nothing in the small dimension stock business seems inconsistent. If there is not it is a fault of the trade some way, somewhere; a lack of getting together and getting at the business as it should be. There is a use for every good piece of oak from the size of a man's finger and a foot long, up, and there certainly should be good use for the thick quartered ends from veneer fitches that range from two to three feet in length. To see stock of this kind going to waste is one of the strongest arguments in favor of having the makers and users of hardwood dimension stock get together and have an understand-

ing, and build up a larger trade in this line of wood products that will benefit both the producer and the user. Good hardwood timber is too valuable to waste in this way, especially since there is a need for all of it and it is merely a matter of getting at that need in the right way.

Cooperage in the U. S.

The United States exports cooperage stock to practically all of the leading countries of the world, and some articles find their way to little-known islands and obscure places in foreign lands. It is a valuable trade and long has been. It has had its ups and downs, but on the whole it has been as regular as any other line of business, and in some directions there is good prospect of increase. The demand for slack cooperage is world wide.

The export of cooperage material has not been of sudden growth. It rests on the solid foundation of many years of trade. Staves for tight barrels were exported from this country in large quantities more than 200 years ago, and export has continued down to the present. The following figures show the number of staves exported for six periods of ten years each.

1790 to 1800 . . .	334,529,000
1800 to 1810 . . .	325,421,000
1810 to 1820 . . .	232,829,000
1820 to 1830 . . .	242,794,000
1830 to 1840 . . .	309,258,000
1840 to 1850 . . .	266,351,000

Excelsior as a Mattress Material

There is a new idea in regard to excelsior, which suggests possibilities for a product from pine and fir, in a consular report from Munich, Switzerland, which says that the Federal Department of Industry there has been experimenting with excelsior produced from fir and pine as a material for mattresses in hospitals and military barracks, and that these experiments have proven eminently satisfactory.

The idea suggested by this in connection with the excelsior manufacturing in this country is that of promoting the uses of ex-

celsior, especially made from pine and fir, as a material for mattresses on the ground of special health-giving qualities. One of the great fights waged in this country is against tuberculosis and catarrhal asthmatic diseases. In this connection it is well known that pine needle pillows are health improving. This idea has been exploited more or less for quite a number of years. Also it is well known that breathing air laden with resinous odors is good and healthful. That is why people seek the pine woods for health now and then.

Now this all being true and accepted, why not excelsior mattresses made from pine and fir for the same healthful reasons? There are machines which will make the excelsior fine and soft so that it will serve all the purposes of comfort, and the excelsior mattress should be cheap enough to commend it on this score and there ought to be room for considerable development of the excelsior business along this line if it were gotten at in the right way and promoted industriously.

Review of Current Trade Conditions

Ontario

There is still very little to say about trade conditions in connection with the lumber business in Ontario. Although, in harmony with other lines of business, the lumber trade has improved during the past few weeks, there has been no important increase in the actual volume of trade, but rather an improvement in the feeling, because of the general improvement in financial and industrial movement in stocks. The prospects, however, are quite encouraging and indicate that a large amount of lumber will be moved during 1914. Low grade pine and hemlock are very scarce on the market and are being held and sold at better prices than they probably would bring in comparison with other goods, if it were not for the shortage of stocks. A well posted wholesaler, discussing this feature of the situation, recently stated that it was quite possible that No. 3 hemlock from Michigan, which he considered to be in the same class as No. 2 from Ontario would soon be an active competitor. In fact he reported that some was already selling f.o.b. cars, Toronto, at prices very little in advance of what Canadian manufacturers were asking for their stock f.o.b. point of shipment. The same wholesaler, discussing mill and dead cull pine, reported that No. 3 common yellow pine, which he classed along with No. 1 mill cull white pine, was now being sold at prices "delivered Toronto" practically the same as the delivered price on dead cull white pine. At present, this does not make much difference to the white pine manufacturer, as he has very little of this stock to offer. The same conditions, however, might have quite an important effect upon the new stock. Of course there is the possibility that the market for yellow pine may have improved to such an extent before white pine new stock comes on the market, that competition from this quarter will not be so keen. At the same time, however, yellow pine is now with us more or less continually as a sobering influence.

Shingles are selling slowly and prices have not altered. This is to be expected at the present time of year. There is a fair prospect, however, of a brisk market in shingles in the early spring, as farmers have had a very prosperous season and are considering extensive repairs and new structures, which will consume both lumber and shingles. Lath are still practically out of the market so far as Ontario is concerned, but there appears to be quite a large quantity of spruce lath being held in the Maritime Provinces.

Hardwoods continue steady at present and the market is normal for this time of year. Several reports which the Canada Lumberman has received of late refer to the fact that large quantities of hardwoods which were blown down in the older sections of Ontario by the storm of Good Friday and that in early November, 1913, may be expected to come on to the market this year. These trees are now being manufactured into logs and delivered to the mills. Some reports indicate that the total quantity of this class of stock will be large and may be expected to affect prices for a time. With active trade, however, such as is indicated by present conditions, it is hoped that this factor will only have a temporary effect.

Eastern Canada

A better feeling is noticeable in the trade at Montreal. No extensive business is in progress, which is natural at this time of year. Dealers report, however, that trade is increasing steadily. Orders for forward delivery are becoming more numerous. It is believed that easier money would be sure to bring about a good demand for lumber in Montreal, as there is a house famine and rents are very high. Building contractors are looking forward to a very active season.

The spruce market at Boston continues quiet and prices are still on the weak side. Frames are selling at \$24.50 and random at \$22. The base figure for dimension seems to be \$24, although some firms are refusing to take less than \$24.50. Spruce boards are quiet and offerings are light. Covering boards 5 in. and up wide, 8 ft. and up long, are selling at \$22 and matched spruce boards at about \$2.50 more.

Better conditions are reported from the lumber trade in New Brunswick than those which prevailed a month ago. There is not much shipping in progress, but the outlook for the English market is quite encouraging. A few mills have sold their cuts of deals for 1914 at prices similar to those prevailing last fall, as reported in our market letter elsewhere. The indications are that prices will be firmer, but this will only be in keeping with the higher cost of the logs which, as usual, have been more expensive to secure this winter than in previous winters. The chief cause seems to be the higher cost of labor and the decline in its efficiency. Trade with American ports is still quiet, as

both buyers and sellers are holding off, in the anticipation of market improvement. January was a hard month in the trade, on account of the severe weather. Much more favorable weather has prevailed lately and reports indicate that trade is already commencing to brighten. Laths are firmer and shingles are moving a little more actively, although prices are unchanged. There is a good outlook for the building trade in New Brunswick during the coming season.

Logging conditions during the winter, so far, have been ideal and a fair cut of logs is now assured, so long as driving conditions are alright in the spring. Sawmilling plants along the St. John are busy with their repairs and are apparently preparing for a busy year.

Great Britain

Reports from Great Britain lay special stress upon the importance of the recent reduction in the Bank of England's discount rate from 4 per cent. to 3 per cent. stating that the relief given to industry and trade is no doubt considerable and will help to strengthen the tendency towards trade revival. Bank reports in fact are more favorable today in Great Britain than they have been since 1896 and all indications in the financial and industrial world are that a revival of business activity is at hand.

A much more cheerful feeling is prevalent on the London spot market than that of a fortnight ago. A tendency is noticeable to look ahead and study probable market conditions. Values have not declined as was predicted in some quarters. Deliveries at London docks during the week ending January 24th totalled 3,848 standards as compared with 4,332 standards during the corresponding week of 1913. At Churchill & Sim's recent auction sale, a lot of 3 x 9 in., 12 ft., 2nd Quebec spruce was sold at £12 10s, and 3 x 7 in., 10 to 13 ft., brought £10 5s. 4th quality 3 x 9 in., 12 to 13 ft., was sold at £11 10s. Quebec birch planks, 4 x 5 in. to 18 in., 7 to 15 ft., brought 1s 1d per cubic foot.

Reports from Liverpool are to the effect that business continues normal with nothing of any special interest to note. The hardwood trade is fairly satisfactory, but is quite lacking in features. A little more activity is reported in c.i.f. and ex quay buying for forward delivery. The best selling line at present is plain white oak lumber, for which there is a steady demand with firm prices except for ungraded parcels. The trade in quartered oak lumber is quiet and stocks are more than sufficient. Prices, however, are firm and only limited quantities are finding their way into consumption. Pine deals at present are firm at Manchester. There is a scarcity of fourth quality Quebec, and owing to the high prices in Canada and the United States it is not expected that much of this stock will reach Manchester this season. This, however, is something that remains to be seen.

United States

Definite improvement is reported in market conditions in the United States. The railroad companies are coming into the market again with orders for several thousand cars and the appearance of the first of these orders gave rise to a general belief that railroad buying on a large scale would soon start. An encouraging outlook is also reported in connection with agriculture. Stocks at the majority of the mills and in country yards are also in favor of an improvement in trade, as there is no sign of a serious over-supply. It is interesting to note that probably the most encouraging factor at present is yellow pine trade. Stocks at the mills are only moderate and prices are stiffening in spite of the fact that retail yards are not yet buying at all extensively. Some reports have been going about to the effect that the yellow pine trade is approaching a period of activity such as it has never experienced before. This may be taken either with or without a pinch of salt, according to one's own information. Logging conditions in northern Michigan have been favorable and woods operations are progressing in a very satisfactory manner. Estimates which have been made on a conservative basis indicate that the supply of logs in northern Michigan will be about 30 per cent. below normal as mild weather at the commencement of the season delayed operations greatly. Reports of improvement are also received from Pacific northwest mill centres. Improvement is noted also in the hardwood trade and the outlook for spring business is favorable.

The northern pine market at Chicago continues steady. The trade during January was fair and a slight improvement was noted with the opening of February. Prices have not changed. Mill stocks are broken and stocks of logs are likely to be lower than normal, so that an advancing market is expected. At Buffalo, the trade in northern pine continues quiet, but enquiries are more numerous.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

St. John Trade Improving

St. John, N.B., February 9th (Special to the Canada Lumberman): The market at St. John is quiet. Very little shipping of lumber is going on, and very little has been shipped during the past two weeks. In fact, as far as the English business is concerned there have been no liners by which shipments can be made to Liverpool, as the present Royal Line of mail steamers have taken no deals, and the C. P. R. liners are sailing from Halifax. Small parcels are going forward to London, but not to any great extent. Shipments to American ports are very limited, only two or three vessels are now loading here for United States ports. So as far as St. John is concerned, the lumber being shipped forward, will have no effect upon the markets. The local market for house building lumber of rough kinds is fair. Of course the month of January was a very hard month, and the cold weather retarded much work which was to have been taken up, but during the past ten days moderate weather has started things, and factories report better trade.

The outlook in the English market is for early business to be good. In fact some two or three mills have sold their cuts of deals for 1914 at about the same prices as last fall sales, viz., \$17 to \$17.50 per M. for deals, specifications running 50 per cent. 7 and 8 in. x 3 in., balance 9 x 3 in. and up, with the scantlings at \$2.50 per M. less; ends at 2/3 the price of deals, and fourths at \$15, all at mills, St. John buyers paying all other charges. What little advance the sellers have from last year's prices will be taken up in the increased cost of the logs which are being cut this year, as apparently every year logs cost more to produce. Labor not only is costing more, but is of an inferior quality. No sales have as yet taken place in the American market from St. John, as the buyers and sellers seem to have the same ideas, viz., that prices will be better a little later on. In fact it is felt that the American market will be from \$1 to \$2 per M. better than in 1913.

Laths are being sold here at from \$2.75 to \$3 per M. on sellers' wharves for the season's sawing.

Shingles are moving a little better than they were, but prices remain about stationary. Box business is good with a steady demand and prices remain firm.

The outlook for local building for 1914 looks very good, and if all the work is taken up and carried along, which is now being figured, a good demand for all rough lumber and factory work should continue through the season.

The winter to date has been ideal for lumbering all over the province, and a fair cut of logs is now being moved to the banks of the rivers. The present month of February sees the beginning of repairs to milling plants all along the river front, and from now on the mills will be under the hands of machinists and masons, until ready for spring work, which will begin about April 1st.

Messrs. Stetson Cutler & Company are making extensive improvements to their Pleasant Point mill yard where they are installing a "turning table" to direct sawn stock from the runs, all over the yard, making it more convenient and saving labor.

J. E. Moore is making extensive alterations in his new mill at South Bay.

Ottawa Expecting Good Local Trade

Ottawa, February 8th (Special to the Canada Lumberman): Some of the beneficial effects of the recently amended United States tariff are beginning to be felt here. Within the past two weeks, several orders for blocks of lumber, in different grades, ranging in quantities from 2,000 to 500,000 feet have been placed by American buyers. Most of these orders are for this season's cut and it is predicted that more are to follow.

Trade locally is showing signs of improvement and the prospects are that this year will be a fairly good one for local dealers, as there will be an extensive building programme to be carried out. The estimates for expenditures on public works, which were tabled in the House of Commons last week, totalled \$190,735,176, a decrease of \$11,920,990, compared with 1912. Ottawa, however, is treated very generously in the estimates for there is \$1,932,000 to be spent here this year in new buildings alone. Some of the improvements on which this money is to be spent include: \$1,000,000 for new departmental buildings; addition to parliament buildings, \$100,000; addition to eastern block, \$35,000; addition to Royal mint, \$35,000; new observatory building, \$80,000; new customs building, \$500,000; new drill hall, \$50,000; improvements to Victoria museum, \$40,000 and other additions and

improvements to government buildings in the city each entailing an expenditure of several thousands of dollars.

Some reductions in the prices of high grade pine have been made during the past week. Pine good sidings 1 in. x 7 in. and up, which formerly sold at from \$52 to \$55 are now more nearly at \$52 to \$54; and for 1 1/4 to 1 1/2, \$55 to \$58 is being quoted instead of \$56 to \$60 as was the case a few weeks ago; while 2 in. x 7 in. and up instead of from \$58 to \$65 are quoted \$58 to \$62. Two grades of pine shipping culls are about \$1 lower, while pine box boards are at \$18 and \$19 for 1 x 4 in. and up, 6 ft. to 11 ft., and \$18 and \$19 for 1 in x 3 in., 12 ft. to 16 ft.

In the House of Commons last week Hon. H. R. Emmerson, formerly Minister of Railways and Canals, asked the government if it was their intention to discontinue the construction of freight and passenger cars in wood and substitute steel. Hon. Frank Conchane, in reply, stated that the government had not decided to discontinue the use of wood for the purposes mentioned by Mr. Emmerson. This sets at rest the rumor that the Intercolonial Railway intended replacing all its wooden cars with steel ones. It is learned that the government has not even given the matter consideration.

Mr. Moses Haney, who for the past few years has been the resident representative in Ottawa for the lumber firm of Skillings, Whitney and Barnes of Ogdensburg and New York, is to be transferred to Sheldrake, Mich., at the end of next month. Skillings, Whitney and Barnes have had a resident representative in Ottawa for the past 40 years and whether they will continue to do so after Mr. Haney goes away is yet unknown here. It is intimated, however, that the amount of business the firm has been doing here lately is not sufficiently large to warrant keeping a resident representative. Mr. Haney says that he cannot say what the future policy of his firm will be in the Ottawa Valley.

Mr. J. R. Booth, the veteran lumberman, who was seriously injured some time ago, is now able to go out for a drive on fine days.

Montreal Trade Improving

Montreal, February 9th (Special to the Canada Lumberman): There is a distinctly better feeling in the lumber market. Naturally one does not look for a large volume of business at this period of the year, but many lumber dealers report that trade is picking up in a very encouraging fashion. A fair amount is being sold for forward delivery. With easier money, the prospects are excellent. Montreal is suffering from a house famine, and rents are being raised in consequence of the scarcity. The building contractors who, from various causes, were unable to supply the normal demand last year, will probably have a very busy season during 1914, and this will involve a heavy demand for lumber.

The building permits for last month showed a slight falling off, as compared with the corresponding period in 1913, being valued at \$409,645, as against \$485,600.

The ground wood market continues firm, for freshly ground pulp, the stock on hand being lessened by the heavy demand. It is hoped that before the spring freshets bring additional power, the stored pulp will have practically disappeared, although one mill in a remote part of the country has still a large quantity on hand.

Western Pole Output Will Be Light

At the recent annual meeting of the Western Red Cedar Association, held at Spokane, Wash., the president, Mr. H. C. Culver, in his address stated that poles, posts and piling had moved freely at fair prices during the first half of the year 1913. A general recession of trade had taken place during the last half of the year, and to-day the industry was in a very unsatisfactory state. He believed, however, that, very shortly, a more healthy condition of affairs would prevail. Stocks were not over large and they were fairly well assorted. The output during the present winter would probably be greatly restricted. As a result of lack of snow, practically no stock was taken out before the middle of January. Sawmill companies had also been inactive and would not produce their usual quota of poles, etc. The president drew attention to the extensive use of poles for conveying electricity. In the United States there were over 800,000 miles of poles lines. Over 32,000,000 poles were in service on these lines and the annual renewal requirements were over 4,000,000 poles. It was claimed that over 65 per cent. of these were cedar. He believed that they might predict with confidence a fair movement of their products during the coming year.

SATISFACTION FOR SALE

OUR Lumber is manufactured with a Purpose. From the Stump to the Finished Product this Purpose is never forgotten. We aim to make our Products and Satisfaction synonymous. We want every car we ship to be filled not only with Lumber but with Satisfaction.

We are equipped to give you uniform grades—dry stock—fine planing mill work—good service and courteous treatment.

When buying of us, your worry, your anxiety, is over with the placing of the order. You know you will get what you want—in the way you want it—that upon arrival, you will be pleased. It will make your business a source of pleasure and happiness.

Fancy Woods and Veneers

THEIR ORIGIN, VALUE AND
USE—COMMENT AND VIEWS
ON AN IMPORTANT BRANCH
OF THE TRADE.

The Russian Veneer Industry

By Henrik Cronstrom

Veneer logs in Russia are cut from December to March and transported to the factory in winter by rail, but in summer often by water, being made to float along with logs coming from lighter trees, to keep them from sinking. The logs are carefully stored away at the factories and are kept in water-basins during the warmer season. This prevents splitting and change in color, and the logs are therefore, when work on them begins, quite as fresh as if they had just been cut.

Immediately before cutting the logs are steamed under pressure, for about six hours. This steaming must be done with much care. The pressure rises slowly from 0 to 15 pounds per square inch. All condensation must be drained from the boilers so the logs do not lie in the water. This is very important. After the steaming the logs are carried as quickly as possible to the veneer-lathe.

Then follows the most important process after cutting. Glue spreading and drying. This is somewhat different in different factories. In most of them the veneer is carried direct from the veneer-lathe to the glue spreaders. Some factories, however, will first pass the veneer through a so-called wringer, to squeeze out a part of the water through the pressure. This tends to reduce considerably the time of the actual drying process. This operation will often remove from twenty-five per cent. to forty per cent. water, hence it is easy to see that the expense of the drying is reduced to quite an extent. Some factories now use even a hot air drying machine for this purpose. The main thing is, however, that the pre-drying—where it is done—is never a complete drying, but has for its purpose only a somewhat lower presence of water in the veneer; hence, practically speaking, it is still in a wet condition when it reaches the glue-rollers.

When the wet veneer goes through the glue rollers it imbibes not only the glue itself, but at the same time the materials that make it waterproof. The glue covered veneer comes then into the so-called glue press, where it is submitted to a high pressure between steam heated plates. In this press where the veneer is held a longer or shorter time, depending upon its thickness, the largest part of the moisture which is in the logs is removed. From this press the veneer is introduced into the so-called dry press, where it dries off and cools off quite thoroughly.

When a veneer for export is to be produced, without special designation of its purpose, the only thing still to do is to cut the veneer into the desired sizes, which is done in a so-called clipper for sizing, and to carry it through a scraper, whereupon it is ready for export.

With several factories, however, a part of the veneer is treated somewhat further, by sawing it into ready plates for tea boxes, chocolate, ash trays, etc. In these cases the appearance of the veneer is often changed by letting it go through a coloring machine, imitation machine, smoothing machine, etc.

This is the general way of manufacture told as briefly as possible.

If we now want to make a comparison between this method and the one employed in the United States we have to remember that in an ordinary factory in Russia there is worked in the main only birch and alder three-ply veneer of a thickness of 4, 5 and 6 millimeters, that is about 5/22-in., 6/32-in. and 7/32-in., while most factories here send out a highly finished product for different purposes. A comparison, if it can be made at all, must limit itself therefore to certain leading features of the process.

How Logs are Stored

Moreover, the writer wishes to call the attention of his audience to the fact that his knowledge of the American veneer industry was gathered during the visits that he has had occasion to make to factories in this country, and it cannot therefore be complete. Hence, it is quite clear that he will be guilty of errors in the following, for which he wishes to apologize beforehand:

First, as to the way in which the logs are kept in storage at the factories, the writer thinks he has noticed that in most factories in this country the logs are kept all the year round on dry ground, while most Russian factories keep the logs in water-basins or tanks during the warm season. The former method is without doubt a disadvantage to the American factories. In spring, when the sap begins to rise in a growing tree, the same thing will happen also in a freshly cut stem. This causes a change of color in the wood, and makes it brittle, and this is especially the case with the birch tree—in fact, as the logs are kept longer on dry ground, they will deteriorate in other ways—

by cracking, etc. As is known, a fresh stem can be kept in water almost an indefinite time without changing to any great extent.

We now come to what is perhaps the most important difference between the two methods—the boiling, cooking or steaming of the logs. The American factories cook the logs for twelve to twenty-four hours in open water reservoirs or tanks. The Russians steam the logs for six hours in closed boilers under pressure. The purpose of the steaming is, of course, to render the logs sufficiently soft and tough for cutting. This purpose is attained in both methods; perhaps the wood gets a little softer through cooking in water. But is something else not likely to take place with steaming? We shall see. In steaming, according to the American method, the logs will take up in themselves more water, so that they will contain practically a higher proportion of water than will some fresh lumber that is treated in the Russian style. All this water will then have to be evaporated by means of the drying process. How does this compare with the Russian style? Through the stewing, in steam, under pressure, a large amount of the water is driven out of the log; the higher the pressure which is used, the more water is removed. Still, the pressure should not be raised to more than fifteen pounds, for otherwise the wood will get too dry. There is, therefore, in this method less water left to be evaporated, following our drying. But something else will happen when this steaming under pressure is used—that is, the sap-cells of the wood are caused to burst, the pores are opened, and the largest part of the sap and foreign matter which is locked up in the pores is driven out.

As before stated, this steaming must be done with care, the pressure being increased slowly. An increased pressure from the start would destroy the structure of the wood. The main thing is to obtain from the process a product that is soft enough for cutting, with open pores, free from sap and containing less water than before dampening.

A gentleman in the United States, who is thoroughly acquainted with the veneer industry, told the writer that he has met with trouble in attempting to dry maple veneer in a drying-machine with steam-heated plates. The difficulty consisted in that from the interior of the wood a sap came oozing, which stayed on the outside and formed a sticky mass. He then tried to steam maple logs without pressure, before the cutting. The result was that the drying in the plate-dryer could be undertaken. What can we learn from this practical example? In the first place, that though steaming in water a large, even perhaps the largest part of the sap remains in the wood. In the second place, how easily the sap can be driven out by contriving a pressure in the cells inside, for there, as in this example, a wet veneer strip is placed between two hot plates; where the temperature is over 212 degrees, the water which is in the wood changes direct into steam, and a pressure results, which drives out the sap. In the third place we see from this example that even through steaming without the least pressure, a part of the sap can be withdrawn. Still, steaming without pressure carries with it one disadvantage that each veneerman has experienced, namely—that the steaming does not work evenly through the whole mass of the wood.

But why is it that the removal of the sap is such an important matter? Because in the first place, as everybody knows, sugar, sap, rosin, and similar substances, are extremely hostile to every glueing. We cannot glue together maple veneer, when the exterior is covered with a coat of sticky sap. In the second place, getting rid of the sap plays undoubtedly a considerable part in producing waterproof veneer, as we shall see farther on.

As far as the cutting itself is concerned, that is done in Russia in the same way as here, and with machinery about the same; still there is a little difference. Sometimes a lathe with a movable knife is used, that is, the knife moves forward and backward parallel with the cutting edge. As we know, it is easier to cut wood when the cutting edge moves in the direction toward the fibers of the wood. Moreover, a smoother cut is obtained. In fact, this is a principle which has come to be employed with almost all woodworking machines. A veneer-slicer is known to be built on the same principle. Why then should this principle not also be followed in a veneer lathe? It is true that the machine gets more complicated, but it should be remembered that such a machine need not be used for rough center work stock, excepting only for the best face veneer. Moreover, the knife in such a lathe retains its sharpness quite a while.

Drying and Glueing

As to the drying and glueing, which then follows, the main dif-

LET US FIGURE ON YOUR 1914 CONTRACTS

Dominion Mahogany & Veneer Company
Montreal West, P.Q.

ference consists in this, that according to the American method the veneer is first dried and then glued, while the Russian process is just the opposite. We shall see farther on what can happen in the two instances. When the drying is done in the American way, the pores in the wood are closed more or less, the surface becomes sometimes somewhat case-hardened; at other times, glossy. When this veneer passes through the glue-spreaders, the main part of the glue stays on the surface. A small part crowds into the wood, as the moisture of the glue opens the pores somewhat. What happens when the Russian method is followed? When the wet or only slightly dried veneer goes through the glue-spreaders, the pores are open, and not alone this, but are also free from sap. The waterproof glue penetrates into the pores and is absorbed by them.

When this veneer is then placed under high pressure between steam-heated plates, the glue is pressed very strongly into the pores. In this way even the larger portion of the water which enters the wood and glue turns into steam and goes off at the same time, carrying with itself part of the glue, whereby the pores are filled even more. Inasmuch as the external strata in three-ply are usually very thin, it will be seen that these are almost entirely impregnated.

It might be thought that this process works slowly and is expensive. The fact is that it is slower than the American process, but there is still another circumstance which should be taken into account. First, we see that while the American veneer contains perhaps forty per cent. to fifty per cent. water before the drying, the Russian contains not much more than half this amount. There is therefore so much less water to be evaporated. If we, however, study the principle of the drying itself closely, we find that two entirely different principles come into play. Without further going into details on this matter, it might only be stated that according to the principles employed in the American plan, a sufficiently large heat is applied to the wood—such an amount as will cause the entering water to pass into water vapor, then the air is heated sufficiently to be able to take up this moisture and finally this moist air is gotten rid of in a mechanical way by blowers, etc., which requires power. Another principle for the drying is that to convert the water which passes into the wood into steam direct. For this purpose no air is needed. It is this principle that is employed in the Russian method.

It would lead us entirely too far to show here in detail which method takes more steam. One fact is, while the Russian factories get along with only about half the amount of steam that is employed by the American ones, still they employ more steam at the time of steaming the logs. Moreover, there are obtained in Europe at least two glue presses with steam-heated plates for the same price as are paid here for a blower dryer. Everything being normal, the capacity, with glue presses of this kind, is about 180 cubic feet for ten hours, or if we take for example 5/32 3-ply equals 13,500 square feet. If anyone should want to characterize in a short, perhaps somewhat exaggerated way, the difference between the American 3-ply and the Russian waterproof 3-ply, this could be done, according to the writer's opinion, perhaps in the following manner. The American 3-ply consists of three strata of wood glued together and the glue which is between the strata has entered only to a small extent into the wood itself, the pores of which are partly filled with dried or solidified sap. Hence the moisture is easily absorbed through the outer stratum and dissolves the glue. The wood fibre or the skeleton itself of the wood is, as will be noticed, not materially attacked by the moisture, but it is the pores that imbibe the water, which causes the wood to swell, and through this again the glueing can also be destroyed by the breaking apart of the wood itself.

Russian 3-ply on the other hand consists of three strata of veneer glued together, and the waterproof glue which is employed is to a large extent driven into the pores of the wood which are empty and

free from foreign matter so that the whole face of the wood is made waterproof. It is clear without further explanation that 3-ply must become much more capable of withstanding the moisture.

If the American veneer would be glued with waterproof glue one would obtain, of course, a more or less waterproof product, but this would still be not of the same kind as the Russian, because the wood itself would continually be susceptible to moisture.

It might still be said that every Russian veneer factory has a well-equipped laboratory for the examination of glue, etc. The writer has not noticed anything of the kind in the American factories.

Cost of Production

A Russian factory of middle size is built for about 210,000 cubic feet of veneer per year. This is about a carload of twelve tons a day. Of this there are only about 10,000 cubic feet unglued in different thicknesses. The material is divided about as follows:

	Cu. ft.	Sq. ft.
4 mm. = 5/32-in. = 50% of all glued veneer	100,000	= 7,500,000
5 mm. = 6/32-in. = 30% of all glued veneer	60,000	= 3,600,000
6 mm. = 7/32-in. = 15% of all glued veneer	30,000	= 1,500,000
Thicker	5% of all glued veneer	= 10,000 = 330,000
Unglued different thicknesses	10,000	= 600,000

Total ... 210,000 13,530,000
Of every thickness there are about sixty per cent. first quality and forty per cent. second quality goods. To make up this production the following number of machines are employed:

- 5 boilers for the steaming of the logs.
- 3 to 4 lathes, depending upon the thickness of logs.
- 3 to 4 clippers.
- 2 glue spreaders.
- 2 glue presses.
- 4 dry presses.
- 2 stock cutting machines.
- 1 to 2 scrapers.

The number of employees in such a factory is about 70 men, or for two shifts, 140. In case of part of the veneer being worked thoroughly there is to be added one bet-machine (coloring machine), one smoothing machine, one imitation machine, five or six circle saws. These require for two shifts 30 men. The total crew employed in this way is about 170 men.

To obtain an idea about the cost of production in such a factory the total expense for the main operation is divided over the whole number of cubic feet of finished veneer. In the United States all calculations are based on square feet, hence the expense has also been reduced to this basis, but we should remember that these figures cannot be absolutely correct, but are only an average because the cost of production, of course, is somewhat different with different sizes. The following figures are not gotten up in a theoretical way, but are taken from results obtained in practice.

Cost of production is as follows:

	Average per cu. ft.	Average per sq. ft.
Wood	31.60c	0.496c
Labor	13.00c	0.205c
Glue	12.60c	0.198c
Administration, interests, insurance, up keep	19.83c	0.311c
Freight to England	9.10c	0.139c
Total	86.13c	1.349c
Market price about	\$1.04	1.627c

The market differs, of course, but depends upon the preceding figures and on an average a profit of .278c per square foot may be added.

ARGALL BROTHERS Three Rivers, Quebec

MERRITT MFG. CO., Lockport, N.Y.

Veneer Machinery

THE "MERIT" LINE of Veneer Cutting, Dimensioning and Drying Machinery is designed first, for veneer mills cutting high grade furniture and commercial veneer from expensive timber, and second, for basket, crate, box and barrel factories using cheaper veneer cut from the less expensive woods.

Merit Veneer Lathe

In addition to Lathes, Clippers, and Driers, the line, includes Knife Grinders, Log Hoists and Trolleys, a set of Crate Head Machinery, a set of Barrel and Basket Hoop Machinery, Basket and Hamper Bottom Rounders, Nailing Forms, etc.

OPPORTUNITIES

WE own and offer for sale on attractive terms a few especially well selected tracts of timber running from 50 million to one billion feet that are ready for immediate operation, having a good local demand at high prices.

The timber on the Pacific Coast is the last stand of the great forests. Well selected timber in British Columbia is the best investment on this Continent and offers especially attractive inducements for manufacturers.

EDGINGS

Ontario

Geo. Watson, Flesherton, has purchased a site for a sash and door factory at Markdale, Ont.

The A. M. Shaw Company, Limited, Fort Frances, Ont., have a large contract for furnishing ties and timber for the Canadian Northern.

The Larchwood Lumber Company, Larchwood, Ont., recently secured a contract from the town of Sudbury for two hundred thirty-five foot poles at \$4 each.

The Frank H. Harris Lumber Company, Limited, has been incorporated with capital of \$40,000 and head office at Toronto. The incorporators include W. H. Harris, F. H. Harris and M. L. Harris.

Construction work on the Abitibi plant at Iroquois Falls, Ont., has progressed so rapidly that operations will probably be commenced with the ground wood pulp mill not later than June 1. The mill will have a capacity of 150 tons per day.

The Welland Lumber Company, Limited, has been incorporated, with a capital of \$100,000, with head office at Welland, Ont., to carry on business as lumber merchants. The provisional directors are J. W. Rounding, F. Edwards and G. E. Tufts.

The City Council of Ottawa is calling for tenders for lumber until 4 p.m. on February 24th. Specifications may be seen at the offices of the engineer, City Hall Building, Ottawa, or at the office of the MacLean Daily Reports, Limited, 220 King Street West, Toronto.

The Lakes Timber Company, Limited, notice of whose incorporation was published recently in the Canada Lumberman, have opened offices at Fort Frances, Ont., on Front street, near Portage avenue, with Mr. Chas. Payne, accountant, as office manager. The company have a large contract from the Canadian Northern, for ties, and expect to get out 300,000 by the time the ice goes out. Their camps are south of Shoal Lake, near Old Mine Centre. Mr. A. B. Colburn, the head of the company, at Fort Frances, is a well known resident of the Rainy River district and last year was the mayor of International Falls.

Booth & Shannon, lumber manufacturers, Biscotasing, Ont., commenced rebuilding in October, the mill which they recently lost by fire. They expect to be ready for sawing by May 1st, 1914. The new sawmill will consist of one main building 132 x 32 feet; one trimmer extension 36 x 20 feet; one lath and picket mill extension 32 x 30 feet; one boiler house 40 x 40 feet and one machine and blacksmith shop 24 x 36 feet. The mill frame is of heavy timber construction and all the upright timbers on the ground floor are set into concrete piers. The main drives are also set on concrete. The machinery consists of one right-hand circular outfit, 42 in. Waterous steel carriage; one 4-in. Prescott steam setter; one 11-in. steam feed; one Waterous Big Champion combination edger and strip machine cutting cants 8-in. in thickness, transfer to trimmers; one standard lumber trimmer; one lumber sorting table 125 ft. in length and one five-saw slash table. The log deck equipment consists of standard jack ladder haul-up; standard steam log kicker, steam log stop and loader and steam nigger. The lath mill consists of a heavy lath bolter and lath machine, also a picket mill. The power plant comprises four 60-in. diameter 16 ft. boilers in Dutch oven setting; one steam pump, copper tube heater, and one heavy duty slide valve engine. All the transmission, shafting, gearing, etc., together with most of the above machinery were supplied by the Waterous Engine Works Company, Brantford, Ont., who also furnished all plans for the construction of the mill and installation of the machinery, which was under the supervision of Mr. W. J. Armstrong, of Parry Sound. The plant will have a sawing capacity of 60,000 feet B.M., per day of ten hours.

Eastern Canada

P. N. LeBlanc has commenced the erection of a woodworking factory at Moncton, N.B.

J. E. Moore, St. John, N.B., is making extensive alterations to his new mill at South Bay, N.B.

The sash and door factory of Amedes Alard at Montreal, P.Q., was partly damaged by fire recently.

Noiseux & Boy, sash and door manufacturers, St. Jean Baptiste (Rouville) P.Q., have dissolved their partnership.

Legault & Leger have been registered at Montreal, P.Q., as sash and door dealers. The members are A. Legault, T. C. Leger and P. Legault.

The lumber and shingle mill belonging to J. O. Gilbert & Son, Bishop's Crossing, P.Q., was totally destroyed by fire recently. In addition to the loss on the building and plant, a considerable quantity of lumber and other stock was also destroyed. The loss will amount to about \$5,000, with only a small

amount of insurance. J. O. Gilbert & Son are the owners of extensive timber limits and it is expected that they will rebuild the mill.

The Donnacona Paper Company have started operations, which were postponed owing to an accident to the flume. The company have a 50-ton newsprint mill.

Stetson, Cutler & Company, St. John, N.B., are installing a turning-table at their yard at Pleasant Point. This will direct sawn stock from the runs to the various piling points throughout the yard, thus simplifying the work and saving labor.

La Compagnie Industrielle de Vaudreuil, Limitee, has been incorporated with a capital of \$49,000, with head office at Vaudreuil, Que., to carry on business as lumber manufacturers. The provisional directors are J. A. Bourdeau, financial agent, Montreal, Que.; A. R. Lefebvre, manufacturer, A. Castonguay, H. Becotte, and J. A. Legault, notary, of Vaudreuil, Que.

Western Canada

C. T. W. Piper, of Vancouver, who has a mill in Burnaby, B.C., is buying limits near Port Haney and may erect a shingle mill.

Robert McNair, Vancouver, B.C., contemplates opening his timber limits near Coquitlam lake, bringing the logs out to Burrard Inlet by railway.

C. T. W. Piper, Burnaby, B.C., is negotiating for a site for a shingle mill at Port Haney, B.C. The proposed site is to the east of the Haney Brick Company's works.

Grain Growers Lumber Company, Limited, has been incorporated with a capital of \$10,000, with head office at Vancouver, B.C., to carry on business as lumber merchants.

Willow River Lumber Company, Limited, has been incorporated with a capital of \$50,000, with head office at Vancouver, B.C., to carry on business as lumber merchants.

The East Kootenay Lumber Company has paid the British Columbia government \$2 a thousand, plus royalty, for a tract of yellow cedar near Waldo, B.C. This is a record price.

George H. Green, of Rossland, B.C., is taking out shingle bolts with the intention of putting up a mill at Green City in the spring, with a capacity of between 30,000 and 40,000 a day.

Practically all the timber in the Toba river valley, B.C., is now controlled by the Canada Timber & Lands Company, of Toronto, a recent purchase having been made. The area of the district is about 26 square miles.

J. E. Doherty, general manager of the British America Mills & Timber Company, has acquired the assets of the Walsh Sash & Door Company, New Westminster, B.C. The factory has been reopened, with W. E. Walsh as superintendent.

The Vancouver Lumber Company, Vancouver, B.C., is making arrangements to put in operation the Red Fir Lumber Company's plant on Burrard Inlet, which it purchased in 1913. This mill has never been operated. Some remodelling is now being done. The mill is to be used for the manufacture of cedar lumber.

W. H. Mueller, of Vancouver, who bought the rights to seven miles on Stave lake from the Stave Lake Timber Company, will start to log them shortly. Seven miles of logging railway will have to be constructed. George P. Challenger, formerly with the Imperial Timber & Trading Company, will superintend operations.

Sealed tenders are being received by the Minister of Lands of British Columbia, not later than noon March 31st, for the purchase of License X 83, to cut 6,510,000 feet of timber on an area situated in the vicinity of Thunder Bay, Jervis Inlet, N. W. D., and containing 532 acres more or less. Two years will be allowed for the removal of the timber. Particulars may be secured from the Chief Forester, Victoria, B.C.

The annual meeting of the Canadian Pulp and Paper Association will be held at the Windsor Hotel, Montreal, on February 26.

The Smart Turner Machine Company, Limited, Hamilton, Ont., are supplying The Black Donald Graphite Company, Calabogie, Ont., with a force pump.

British Columbia shingle manufacturers are reported to be organizing a selling agency, modeled somewhat along the lines of the Red Cedar Shingle Manufacturers' Association in the state of Washington.

The market for lumber is very poor in the towns and cities, but the sales to farmers around harvest time were good, although prices were low and are likely to remain so for a year at least, possibly two years, as the large mills are over-stocked.—J. S. MacDonald, Canwood, Sask.

Lumber Wanted

Already sawn or to be sawn

Cuts of 1" and 2" Hemlock

SPARTAN BELTING

*Dominant in the Field
of Hard Service*

Spartan Belting like the Spartan men of old is intensely strong and durable, resisting absolutely those abnormal conditions which rapidly ruin ordinary belting.

Planers and matchers that eat up lumber at the rate of 200 to 300 lineal feet per minute demand the maximum efficiency in belting equipment.

Spartan Leather Belting

is built especially for those high speed drives. It stands hard service on small pulleys because of its unusual flexibility which ensures a firm and instantaneous grip.

We guarantee that **Spartan Belting** when used under the same conditions will transmit more power and with greater economy than any other form of transmission.

Send for Spartan Book and our Text Book, "The Care of Belting." Both are free and sent by return mail.

Brake Your Load and Save Your Horses

Besides avoiding accidents and eliminating sand hilling this braking device can greatly reduce your hauling costs. Larger loads may be handled and fewer men employed.

Our catalogue fully explains

Ryther & Pringle Co.

Carthage, N. Y.

Barienger Braking Device for letting heavy loads down steep hill and mountain roads. Saves horses and expense of sand hilling.

Transmit 100% of Your Power

Why pay good money to generate power and then employ a poor belt that will only transmit a fraction of that power.

If you equip your mill with Goodhue Belts you can transmit 100% of the power generated.

Goodhue Belts stretch 15% to 25% less than other belts and have just the right amount of "cling" on the pulley.

Write us for particulars and prices.

YOU CAN DO IT WITH— A GOODHUE BELT

J. L. GOODHUE & COMPANY, LIMITED.
DANVILLE, QUEBEC CANADA.

GET 20 PER CENT. MORE LUMBER FROM YOUR LOGS

Results from logs of given dimensions cut on Breeze, Denison & Co. pat. band mill.

Diam.	Log Length	Feet Lum.
8 in.	16 ft.	45
10	12	54
10	16	69
11	15	96
14	16	171

by using our
**Patent Steel Band
Mill and Carriage**

This result was attained by different users of our mills during the season of 1912. We can prove to your satisfaction that this mill will cut more lumber and superior lumber than any other Band or Circular Mill on the market.

Special features of Mill

Concrete foundation not necessary. Frame constructed with brace bolted to same timbers which support base of mill. This prevents any movement of mill foundation throwing mill arbors out of cross line. Supporting timbers attached to track which prevents variation in cutting of boards.

Roller Bearing Carriage

designed to do away with lost side motion which is quite necessary for successful work in double cutting bands.

Double Action Friction Set Works

working on thin steel disc, which can be successfully used in place of usual foot friction in receding knees. This cuts down weight in pinion shaft, therefore reducing momentum, so that it is beyond speed of setter to over set by rapid work.

Carriage can be changed from high to low speed instantly and can be operated without passing saw more than six inches either way.

Knee opening to 44 inches. Guide prevents any binding motion to the gip and will automatically raise when coming in contact with knot in timber. Guides adjustable when mill is running.

A Canadian Built Mill of superior manufacture.

Write Us If Interested.

**Slow
Speed**

**Low
Power**

Our new Blow Pipe and Heating department where all the sheet metal work is done on our feeders and collectors. We have every facility in this shop to carry on large contracts and get them finished in a hurry. Working conditions are ideal for the men and there is absolutely no waste motion. This means a saving of money for the customer as well as for ourselves.

**Correct Application and Design of a Shaving Exhaust System
Has Developed into a Highly Specialized Engineering Project**

A dust collector on one of our large Canadian factories. This entire system was put in by us a few months ago.

There are only a few

What I Can Do For The General Planing Mill

You don't have long runs on a few kinds of patterns, the kind that requires a "333" — your work is mostly short runs, different kinds, different sizes, different patterns—the kind that need me. Here's what I can do for you:

1. I will take care of all your matching and sizing up to 24" x 8".
2. I will do all your double surfacing up to my full rated width.
3. I will run all the flooring you need.
4. I will serve you as an inside moulder carrying formed cutters up to 1 1/4" projection.
5. I am readily accessible in every part, so that changes can be made quickly, easily and economically.
6. I have all the conveniences, all the time-saving adjustments and all the grade-raising value of the latest fast-feed matchers.
7. I have a mechanically perfect drive that makes every ounce of power count.
8. I run at a low operating cost, both for power consumed and upkeep expense.
9. I am medium in weight and size.
10. I am also medium in price, so that any mill can afford to put me in.
11. I am making money—big money—for hundreds of successful planing mill owners, men who, like you, are operating a general purpose mill.
12. I will do the same thing for you.
13. I invite you to write today—now—to my designers and builders.

J. A. FAY & EGAN CO.

465-485 W. Front St., Cincinnati, Ohio, U. S. A.

Potato Scale Boiler Cleanser

This compound is a deadly enemy to scale and not only removes scale from tubes but if used regularly in the feed water prevents the formation of scale.

It contains no ingredients that can in any way harm metal.

Potato scale is sold under a guarantee—thousands are using it and are perfectly satisfied. Write for sample keg.

C. C. Snowdon

Box 1384

Calgary, Alta.

**Not altogether what we
say but what users say**

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs,
in calm weather, 30,000 in a head wind.

West & Peachey - Simcoe, Ont.

**Gumming Seven Twenty-Four
Foot Saws a Day and the Wheel
Has Not Glazed or Burned After
Seven Months Use**

Aloxite Saw Gumming Wheels

Are making such records as this—giving such real saw-gumming results. They cut fast, and clean—hold their shape—show long life, and they cut cool without case-hardening the saw.

Let a Trial Wheel show you.

DISSTON Inserted Tooth Saws

DISSTON Points and Holders

Advantages of the Chisel Point Saw

While the first cost of a Chisel Point is more than that of a solid tooth saw, it is much cheaper in the long run for the following reasons:

It is not necessary to buy a larger saw than is actually required on the start, for the Chisel Point Saw always retains its original diameter. It never requires gumming and unless it meets with an accident very seldom needs hammering.

The only tool required to keep it in order is a file. It can be pointed or sharpened in a few minutes and in the event of the saw striking iron in the log all necessary repairs can be made in a very short time by inserting a new set of points. Consequently the money saved in buying a smaller saw, the additional saving effected through not requiring a gummer or other tools usually necessary for keeping a Solid Tooth saw in order and quick re-fitting make the Chisel Point Saws decidedly the most economical.

In addition to the foregoing, owing to the angle at which the teeth strike the wood and the ample gullet room for taking care of the sawdust, the Chisel Point Saw requires less power to drive at a given rate of feed through a cut of given thickness than any other pattern of saw.

Disston Points

One of the leading features of the **Disston Point** is the shoulder at top of bit which rests against the saw plate, affording a strong permanent support. This shoulder makes it impossible to mill the groove in a Disston Point. To make the groove conform to an exact shape, therefore, the point, after drop forging, is placed in a powerful press before the hardening and tempering operations. This press gives a smooth, even, correct form to the groove. A Disston point fits perfectly and remains firmly in place until the edge is worn down.

A milled point, on the other hand, cannot have this shoulder. The pressure is born on the foot of the point which rests on a projection in the saw plate, some distance from the periphery line. The metal back of the head wears or bends away from the point, leaving a slight space which permits more or less play in the point.

A Disston drop forged and pressed Point remains solid and firm, but a milled point soon begins to chatter and lead out of the cut. The increasing wide-spread use of Disston Points is the best possible assurance that they not only meet every requirement, but outwear all others as well.

These Curves Show the Increased Pulling Power Produced by Cling-Surface

and as they were plotted by Robert Thurston Kent, M.E., you can know they are authoritative

Mr. Kent tested two new belts—one treated with Cling-Surface, and the other not. To make the test perfectly fair both belts were first driven side by side in a New Jersey factory. Then, by means of a testing frame built especially for the purpose, some weights, and a polished rigid pulley, the comparative tests indicated by these curves were made. The complete statement which Mr. Kent has prepared covering these tests is now printed in booklet form. If you

wish, as you should, to improve economy in and in connection with your belts, we will be pleased to mail you a copy. Cling-Surface stops slip; makes belts pliable, easy running, and long lived; waterproofs; and reduces friction. Cling-Surface is used all over the world with equal success—in the driest, wettest, hottest and coldest climates. Your order or inquiry will have our best and quickest attention. We quote f.o.b. ON Berlin
Band Saw-
ing Machinery
Are Improve-
ments You Can-
not Buy Else-
where at Any
Price.

THERE'S A BERLIN BAND FOR EVERY PURPOSE

The Berlin offers you the most complete line of Band Sawing Machinery in the World. Whatever rip or resawing you want to do, in any branch of woodworking, there's a Berlin especially adapted to your conditions.

Most Band Saws represent the ideas of one designer. Berlin Bands combine the practical ideas of millmen from every section of the country with the scientifically worked out designs of Berlin Engineers.

Our men learned the weak points of Band Resaw design and construction from personal observation in mills and experience with the machines in operation. Then, with the co-operative help of men of long experience on Band Sawing problems, they designed the machines that give the service demanded.

This is why mills from coast to coast are installing Berlin Bands exclusively. They value the completeness with which the various Berlin Bands cover every working condition. "Berlin" service is the service they're after. It builds up their profit.

Let us prove that Berlin Bands will insure you a bigger profit. Operate a Berlin side by side for one month with a Band of any other make. Decide in favor of one that proves easiest to operate, requires the least power, the lowest upkeep, and does the best and most work at the lowest cost.

It's a Berlin!

Berlin Bands Give Results

Berlin Bands are built for lifetime service. They embody improvements you cannot buy elsewhere at any price. The base is a one piece casting. The upper wheel is constructed entirely of steel with staggered steel spokes and weldless steel rim. The lower wheel is cast of special iron with hardened face. Both wheels are accurately ground and balanced. The rolls are set by a quick, accurate set works, and powerfully driven through a variable speed device by wide, open belts. A knife-edge straining device protects blades from excessive strain.

Each Berlin Band is built with care and accuracy. It costs us more to build such machines, but they are the cheap-

est for you to use. Cheaper because they will consistently produce more and better work, day after day, year after year.

The Band Saw Book illustrated above tells all about Berlin Bands and offers practical suggestions for increasing your profits. "Fitting and Operating" will help your filer. "Turning State's Evidence" shows what your neighbor users think of Berlin Bands.

Use your letterhead in sending for these books. The edition is limited.

Logging Locomotives

Mikado Type Locomotive, Polson Logging Co.

The Mikado is a good type for heavy hauling, where runs are fairly long and high steaming capacity is needed. The locomotive illustrated traverses 30 degree curves, and can be used on rails weighing 45-50 pounds per yard. It is simple in construction, strongly built, and rides well on uneven tracks.

When in need of a logging locomotive, consult

The Baldwin Locomotive Works

Philadelphia, Pa., U. S. A.

**LOGGING LOCOMOTIVES**

THE knowledge and experience of fifty years in locomotive designing and construction is what you get in our Logging locomotives. They are specially constructed for logging operations and will stand up to the severe service in which they are expected to run.

They are as carefully designed and built as our 200-ton locomotives. Repair parts may always be obtained on the shortest notice.

May we send you Specifications?

Canadian Locomotive Co., Limited, Kingston

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

December 20th, 1912.

The Pioneers

We alone manufacture the Genuine "DUNBAR" Shingle Machines—other machines advertised as such are imitations.

Operating our "Dunbar" Shingle Machine one man will joint and sort from 16 to 45 thousand shingles in a day of 10 hours. Good shingles too.

We are Canada's Pioneer Shingle Machine Manufacturers, and we respectfully solicit correspondence from lumber manufacturers.

The Smith Foundry Co., Ltd.

Successors to McFarlane, Thompson & Anderson Mfg. Co.

WATEROUS STEEL GIRDER CARRIAGES FOR MEDIUM MILLS

FOR medium power mills our Steel Girder Carriage has no equal. We build a complete line—in three distinct styles—which we can guarantee second to none in cutting ability, wearing qualities and in continuity of service.

With knee opening of from 30" to 50", these Carriages are adapted for Band or Circular Mills and for Steam or Rope Feed.

They are turned out with exceptional care. A sturdy, well put together frame, knees and log-seats of great strength, with dogs, setworks and accessories identical with those supplied on our heavy cast steel carriages.

Our new Medium Carriage Catalogue No. 111 describes them fully—send for it.

"FROST KING" METAL

\$5,000,000.00

worth of mixed metal
sold annually.

Our thirty five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock this, write us and we will take pleasure in making you a shipment of a 25 lb. box.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 16-ft. Slash table. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 2 Lath Trimming Saws. | |
| | POWER PLANT |
| | 1 24 x 36 Slide Valve Engine with 40-in. x 12-ft. extra heavy double arm split fly wheel. |
| | 2 Double Duplex, high pressure Water Pumps. |
| | 5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam. |
| | 2 125 h.p. Water Wheels. |
| | 1 Upright Engine for sawdust conveyor. |
| | 1 10 h.p. Engine. |
| | 1 Mitts & Merrell Hog. |
| | 1 Wood Machine for 22-in. wood. |
| | 1 Wood Machine for 16-in. wood. |
| | 1 Edger for ripping dry lumber, installed. |
| | 1 Edger for ripping dry lumber, not installed. |
| | 1 30 h.p. Generator, 250 volt. |
| | 1 30 light arc generator. |

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and rails and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

FILING ROOM

- | |

**Long Service
and Satisfaction**

The operator, owner and consumer all derive profit and satisfaction from the Shimer Cutter Head. The operator is pleased because the Heads have a "make-ready" built into them which relieves him from the cares of "fitting and trying." The owner gets satisfaction out of the fact that the output is increased and the work raised in quality. The consumer gets material which goes into place with less labor and expense and presents a better appearance when finished.

Shimer Cutter Heads are made for the express purpose of helping mill men to do better work and to save time and labor—to relieve them from many of the annoyances which come up daily.

To this end they are provided with the Shearing or Shave Cut—the chip is divided by the upper and lower Bits—the Bits are set on the Heads so the diamond

The "Shimer Limited" with Expansion, price \$72.46 complete.

shaped point of the Bit leads in the cut, with a clearance to the cutting edges that effectually prevents friction.

Shimer Cutter Heads are easy to understand, are made strong throughout and have no delicate parts to get out of order, hence they give a lifetime of profitable service at low cost.

We want the desirable features of these tools to impress you in a practical way, hence our offer to send them on trial for 30 days.

Mail us measurements today.

12" Felloe, Hound and Bow Bender.

Designed to Meet all the Requirements for Economical Wood Bending.

We have given much time and attention to this special industry. The machines we have built for bending all classes of wagon and carriage rims and bows have proven highly satisfactory in the many locations in which they have been placed.

The "Defiance" 12" Felloe, Hound and Bow Bending Machine shown herewith will bend hard wood as large as 5" thick, 12" wide with adjustments sufficient to accommodate changes from 16" to 72" circles.

The No. 2 Improved Rim Packing and Cut-off Machine also illustrated herewith will receive the rims or bows after they are bent, and when placed in position, the carriage holding them is moved to the saw and the surplus ends are cut off, making them all register alike.

These two labor-saving machines will meet your demands and we should be pleased to receive your request for further information and price.

COVER YOUR TOWN WITH J-M ASBESTOS ROOFING

Other dealers have literally roofed entire communities with this roofing—and so can you!

The superiority of J-M Asbestos Roofing over all other ready roofings is so apparent that it virtually sells itself. And furthermore, every customer becomes a booster for you—with the result that additional sales are sure to follow.

In a short time you find yourself in possession of a regular little roofing monopoly. And every sale means big profits—because you have no competitors. Only one dealer in each town. Hence no price cutting.

Selling Points that Land the Business:

Made of fireproof asbestos felts and Trinidad Lake Asphalt. Literally a sheet of pliable stone.

Gives perfect fire protection.

Contains nothing to rot, rust, crack or deteriorate.

Never requires coating, gravel or protection of any kind.

Lower in first cost than tin or slate—and cheaper than all other roofings when cost-per-year is considered.

Adapted to all types of buildings in all climates.

Easy to apply.

Write today for Special Dealer Proposition. And REMEMBER, only one dealer in each town.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, \$2.00 per year in advance; other foreign countries embraced in the General Postal Union, \$3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 34

Toronto, March 1, 1914

No. 5

B. C.'s New Timber Royalty Act

The introduction of the new timber royalty act by Hon. W. R. Ross, Minister of Lands for British Columbia, is looked upon by the lumbermen of that province as the most important event in connection with legislative matters relating to the lumbering industry that has taken place for many years. Briefly, the new act is expected to give to the lumbering industry that measure of stability which it has lacked for so many years, and which is expected to enable it to attract capital from Great Britain and other countries. In 1909 the government of British Columbia passed a special licence act. Previous to that date licenses had only been renewable for twenty-one years. This act made them renewable in perpetuity. The object was to provide stability for the industry, so that it could attract capital. Unfortunately however, the lumbermen of the province found that their special licenses, although in many cases millions of dollars had been invested in them, were of practically no value for financing. After an agitation of several years the lumbermen have now succeeded in persuading the government of British Columbia that it is imperative to fix rentals and royalties also, for a sufficient term of years to afford reasonable stability. This is the purpose of the new "Forest Act," or rather of an amendment to the "Forest Act" which was introduced by the Minister of Lands recently, fixing the rentals at the coast at \$140 a square mile and the rentals in the mountain district at \$100 a square mile, the latter being a reduction of \$15 per square mile. These rentals are definitely fixed as the maximum for a period of forty years commencing in 1915.

The royalties are fixed for the same term on a profit sharing basis. Small increases become effective in 1915 and the rates thus established are to remain stationary for a five-year period. Then there will be a readjustment for five years and other readjustments every five years subsequently, until seven five-year periods have passed. The readjustments will be based upon a sliding scale in which it is provided that the crown shall participate in the profits if the average wholesale selling price of lumber exceeds \$18 per thousand feet.

That the introduction of these measures is being received with considerable satisfaction by the lumbering industry in British Columbia is indicated by the opinion of Mr. W. A. Anstie, of Revelstoke, B.C., managing director of the Forest Mills of British Columbia, who, during a recent visit to Toronto, expressed himself favorably in regard to the new legislation. Some of the timber holders and manufacturers of British Columbia, he said, might feel disappointed that the government had not seen fit to meet the demand for more substantial reductions in rentals. Still he felt that the majority would agree that the measure of stability afforded by the new legislation would more than compensate for any lack of reduction in rentals and that the timber interests on the whole would be satisfied with the situation.

The B. C. "Saturday Sunset," in a recent issue dealing with this situation from another point of view said: "A feature of great interest and considerable felicitation is the renewed interest in the timber market. Since 1911 but few blocks of timber have changed hands, and prices have shown a disposition to sag, particularly in the unsettled state of royalties and dues, the subject of which is being investigated by the province with a view to increasing them but at the same time determining on a policy which shall hold for a long term of years. Several blocks have changed hands during the past three weeks, and there is a persistent enquiry chiefly from across the line, with a considerable number of actual buyers already in the city.

"It is felt that the advent of the opening of the Panama Canal this summer and the larger market this will afford will accrue to the benefit of the holder of British Columbia timber. The real reason lies a little deeper. President Wilson has thrown the entire weight of his position and steadily growing influence toward the repeal of the free toll provision for American bottoms through the Panama Canal. While the repealing act will be fought very bitterly in both houses this spring, because a great portion of the business community is against it, it seems likely to be successful. The free toll provision of the Panama Canal act passed last year, which was protested by Great Britain, acting for herself and other shipping countries as an evasion of the Hay-Pauncefote treaty was ostensibly passed on the arguments that it was a bonus to American shipping from and to American ports and since shipping was at very low ebb something ought to be done to stimulate it. Then, since no foreign ship could trade between American ports, foreign shipping was being denied nothing, and the question in the words of ex-president Taft was a "local question," and could admit of no arbitration, and at the same time was no evasion of treaty rights. These were the ostensible reasons for the passage of that provision. The true reason lies in business. It has been stated frequently that the Weyerhouser and the timber interests of California and the Pacific Northwest of the United States wrote the plank in the Democratic platform, and were responsible for its enactment into law. The advantage to the lumbering industry of Washington, Oregon and California is manifest. With a differential of \$1.50 per ton, the Canal dues, in favor of timber from those states against the timber in British Columbia means a safe market along the Atlantic seaboard with competition from this province for a number of years acting under that bill, dead, except such of a local character between American operators. It was affirmed that the passage of that act meant one hundred million dollars into the pockets of the Weyerhousers, and a like proportion to the other timber holding interests. It is easy to see that the loss of this potential wealth will not be given up without a fight."

Solving the Waste Problem in B. C.

The problem of utilizing what is generally known as waste timber and waste lumber, in connection with the logging and lumber manufacturing industries of British Columbia, presents all the well-known difficulties which have always affected these industries in districts where the production is largely for export markets. Wherever a lumbering country has insufficient population to provide markets for the output of its forests, the waste problem is exceptionally difficult. As population increases, new uses are found for the less valuable portions of the tree which formerly could not be marketed. British Columbia with its progressive forest administration, and with

the advantage of the experience of other countries which have had to face the same difficulties, is doing much to lessen the waste involved in these industries. An interesting outline of the situation is contained in the report of the Chief Forester for the year 1913, which has just been published, in the course of which he says:—

It must be admitted that there is less progress in British Columbia in the utilization of waste timber for the manufacture of by-products than elsewhere in Canada. The complete utilization of timber is only possible where stumpage is valuable, labour is cheap, and there is a large buying population which can be reached without excessive freight rates. These conditions do not yet exist in British Columbia; consequently, only a small proportion of the forest can be marketed, and large quantities of timber are left in the woods or sent to the burners because no profitable use can be made of them. Nothing can be accomplished here on a commercial scale approaching the complete utilization effected in Europe and in some parts of Eastern Canada. High freight rates prohibit the shipping of small wooden articles away from the Province; the local population does not create a demand which cannot be more cheaply supplied from elsewhere, and even if a demand did exist for articles which could be manufactured from what is now termed waste, it would be cheaper to buy good logs than to gather up the inferior material now left in the woods or sent to the burners. Clean logging and complete utilization will therefore come slowly in British Columbia. At present the most complete utilization in the Province is in the Crows Nest Division of the Cranbrook District, where green and dead material down to 3 inches in diameter and 3 feet long is taken off for use in mines.

Nevertheless, the lumber manufacturers of British Columbia have by producing lumber in odd and even lengths and widths saved a great deal of high-grade lumber, and have set an example in close utilization to all other lumber-producing districts on the continent.

Another common form of saving waste is the taking out of cedar for shingle-bolts and posts. The market for these commodities is increasing, and it may be confidently expected that hereafter very little cedar will be lost. On the Coast the pulp-mills use large quantities of hemlock which, under market conditions, could not be utilized for lumber manufacture and would otherwise be left in the woods to rot. An unsuccessful attempt was made to market hemlock-bark, but the cost of preparing it was found to be too great. The coal-mines of the Prairie and Crows Nest District provide a steady market for material too small to put into lumber. Aside from the instances quoted, logging operators west of the Cascades leave nearly everything in the woods that will not produce a No. 2 or good No. 3 log. Utilization east of the Cascades is much more close, and compares favourably with conditions in Eastern Canada.

The chief market for sawmill refuse is found in fuel, which production is an important side-line of every sawmill in or near a centre of population. The market for this in 1913 was (because of the coal shortage) better than ever before, the sale being estimated at 300,000 cords, valued at \$900,000. Large quantities of sawmill refuse are also used under burners to produce power; and in addition the manufacture of sawdust briquettes for fuel purposes has been started. These appear very satisfactory and sell for the same price as coal.

An outlet for the use of sawmill-waste may be found in the manufacture of sulphite pulp. A 40-ton plant has been erected in connection with a sawmill at Marshfield, Oregon. This plant, if it proves successful, may cause the utilization of similar material in British Columbia.

A study of the wood-using industries of the Province is now being made by the Forest Branch. The results will be published in such a manner as to make known the importance of these industries, and to suggest, if possible, new markets for materials now unused.

What Regulates Waste Utilization?

"Closer utilization of timber" is the subject of an article published in the February issue of "Conservation" issued by the Canadian Commission of Conservation. "Popular opinion holds the lumbermen responsible," says the article "for the wastage of 50 to 75 per cent. of the timber which he handles, this waste consisting of high stumps, broken trees, logs and uncut timber left in the woods, and of sawdust, slabs, edgings and trimmings at the mills. The lumberman maintains that he saves as much material as he can at a profit, and that he should not be charged with wilful waste when he refuses to handle material which cannot be sold for at least the cost of production.

"Conditions which make possible closer utilization in logging and manufacturing are:

1. Ready markets.
2. Cheap transportation.
3. Character of timber.
4. Efficient management.
5. Proper equipment.

"The labour costs in handling waste material are often prohibitive. The present low price of stumpage makes it more profitable for the manufacturers of many small wooden articles to buy logs, and entire timber tracts, than to manufacture from the waste of lumbering operations."

These are facts with which lumbermen are all familiar, with the exception of the last statement, to the effect that the present low price of stumpage makes it more profitable for the manufacturers of many small wooden articles to buy logs and entire timber tracts, than to manufacture from the waste of lumbering operations. Just what this statement means, is difficult to understand, but if it means that manufacturers of small wooden articles are in the habit of buying tracts of timber to secure their raw material, it is scarcely accurate. Nor is it right in making the general statement that the present low price of stumpage is the cause of such a situation. Take the price of stumpage in Ontario to-day, for instance, and the case seems to be very different. Far from being at a low price; stumpage in Ontario

to-day is so expensive that many of the large manufacturers in the Georgian Bay district have decided, during the last year or two, to cease their operations, or to reduce them greatly. It is a generally acknowledged fact that stumpage in Ontario to-day is so high in price that the competition of other classes of timber and lumber, especially the products of the Southern States, is making it difficult to manufacture in Ontario at a profit. There are other factors, of course, which are playing a part in this situation, but it is not proper to lay the blame at the door of cheap stumpage.

In some of the provinces of Canada, particularly British Columbia, the working out of these factors is quite apparent and it is true that over-production has been stimulated by cheap stumpage, or rather by stumpage which is readily available and cheaply logged. In such a country, the manufacturing of small articles from waste is not practical. In Ontario, Quebec, and the Maritime provinces of Canada, however, statistics which have been published recently by the Forestry Branch of the Department of the Interior show that the chief factor in this problem of the utilization of waste is the proximity of markets, not the price of stumpage. Throughout Eastern Canada good progress is being made in using up material which formerly used to be sent to the burner, and the reason in every case is, that markets have been found, close enough, to make the process profitable. Low price of stumpage is only a coincident condition, resulting to some extent from the absence of markets. An artificial increase in the price of stumpage, for instance, would be of no avail in increasing the utilization of waste. It would simply make the holding of timber that much more expensive for the time being, unless it was accompanied by profitable manufacturing conditions growing out of the proximity of better markets.

Those who wish to see the closer utilization of waste must devote their attention more to the study of neglected opportunities for using up material which is now wasted, and to bringing manufacturers into closer touch with profitable markets. The step recently taken by the Forestry Branch of the Department of the Interior, in the direction of undertaking an exhaustive series of tests of Canadian

woods and studying the various uses to which each can be put, is along the right direction and is certain to have good results.

The article referred to above concludes as follows:—"Many by-product plants require such large investments and an assurance of a long-time supply of material that their erection is possible only in connection with very large lumbering operations. The conditions surrounding many small operations are such that close utilization is impossible.

"Material is saved only as it is valuable. Closeness of timber utilization is in direct proportion to stumpage values. In some large and favorably situated Eastern lumbering operations, high timber values and good markets for a wide variety of products permit the utilization of practically all waste. In many Pacific Coast operations

where standing timber of low value is abundant, and sawing capacity is in excess of market demand, much waste is at present unavoidable.

"Over-production of lumber and other wood products is a prolific cause of forest waste. Over-production results from unlimited competition in the exploitation of forest resources.

"Educating the consumer to the use of grades and sizes of material now rejected will accomplish much in decreasing forest waste. The consumer has the final say in the disposition of the products of the manufacturer. This is not a condition peculiar to lumbering alone, but applies to the market for all manufactured and agricultural products. A market for forest products equal to that in Germany would result in as close timber utilization in Canada as exists in Germany."

Ohio's Woodworking Industries

A bulletin upon the wood-using industries of Ohio, has been published by the Ohio Agricultural Experiment Station in co-operation with the Forest Service of the United States. The report is chiefly interesting on account of the wide variety of uses to which it shows that lumber is put in the State of Ohio. Nearly every State in the Union as well as many foreign countries send some portion of their forest material to Ohio for utilization in manufacture. The value of the commodities turned out by these factories, together with the value of the rough forest products, like lumber, shingles, cross-ties, etc., amount in one year to nearly \$156,000,000.

There were more than 1,900 sawmills operating in Ohio in 1860. This number was steadily maintained for several decades, when the failing timber supply began to be felt and the larger mills were compelled to move to other regions. In 1910, 1,532 mills were still operating in Ohio. These were mostly portable mills of small capacity. Their combined cut was 542,000,000 feet, as against 390,000,000 saved in 1900, a decrease of more than 45 per cent.

Over 63,000 wage earners in Ohio are dependent upon the wood-using industries and sawmills. These establishments, aside from the sale of the raw material, added to the wealth produced in the State

each year \$96,000,000. At present the home-grown timber is far short of the 200,000,000 feet of lumber required for the maintenance of the wood working factories. Small tracts of valuable hardwoods are still to be found in the western part of the State, but it will not be many years before these have been consumed.

Yellow poplar is used in larger quantities in the State of Ohio than any other variety of wood. The annual consumption amounts to nearly 140,000,000 feet, and the average cost is \$29.42. White pine comes second in the list with 120,000,000 feet at an average cost of \$29.68. Practically all of this is imported into the State of Ohio. A little over 100,000,000 feet of white oak is used, at an average cost of \$37.23 per thousand feet. Ohio produces about 46 per cent. of this total. Long leaf pine and short leaf pine are each used to the extent of a little over 70,000,000, the former at an average of \$26.26 and the latter at \$25.75 per thousand feet. All of this is imported.

Of the woods grown in Ohio, the greatest consumption record is that of white oak, the amount being over 46,000,000 feet. White oak grown out of Ohio is consumed to the extent of 54,500,000 feet.

Over \$124,000,000 is paid annually by the wood users of Ohio for their raw material. Over \$43,000,000 of this leaves the State annually

Editorial Short Lengths for Busy Readers

A recent ruling of the United States Treasury Department in regard to the duty upon flooring entering the United States will be rather an unpleasant surprise to some Canadian manufacturers who have been looking forward to extending their market in that country. A Canadian firm of flooring manufacturers shipped several car loads recently to the United States, expecting them to enter free of duty, under the new tariff. When the shipment came to the attention of the New York customs appraisers the matter of duty was referred to the Treasury Department at Washington, and a ruling was finally given to the effect that flooring, tongued and grooved, end matched, flat backed, and unbored for nails should be admitted free of duty, but that similar stock when hollow-backed and bored for nails should pay a duty of 15 per cent. ad valorem.

An interesting address was delivered recently by Col. H. Appleton before the Victoria Board of Trade's Committee on Trade and Commerce, at Victoria, B.C., upon the possibilities of promoting closer commercial relations between British Columbia and India. As a result of Col. Appleton's address, the Board of Trade's Committee has presented a report which, it is hoped, may lead to the development of an important trade in lumber between British Columbia and India. The committee in its report, say that they are impressed with the possibility of increasing this trade. The Douglas fir, cedar and spruce of British Columbia appear to be suitable for use in the tropics, the resins in the two former being obnoxious to white ants and the spruce being practically unaffected by climatic influences and therefore very useful for doors, windows, etc. The committee also report that, according to their information, these woods, in point of strength and durability compare favorably with the same class of lumber now in

use in India. The committee has brought these facts to the attention of the Hon. Wm. R. Ross, Minister of Lands for British Columbia and has suggested that specimens of British Columbia lumber and timber for test purposes be presented to the government of India. The committee also suggested that there should be offered to the Government of India, free of cost, a sufficient supply of British Columbia wood to be used in the interior decorations of chambers, offices, etc.

A series of regulations governing the floating of timber in Pacific coast waters in Canada is contained in an act recently introduced in Parliament. The proposed act prescribes that, whereas stray logs floating in the sea and tidal waters of British Columbia are a serious danger to navigation and it is desirable that action be taken to clear such waters from stray logs, therefore when any logs or timbers are found floating at large in such waters or abandoned, or cast up on the beach or shore, any person finding them and being authorised either by the British Columbia Government or the owner of the timber may take charge of the same and, if the owner can be located, notify him. The owner would be given forty-five days to claim the timber and pay salvage on it.

Another act that has also had first reading will affect sawmill and pulp mill owners who discharge effluent, sawdust, etc., into navigable waters. The proposed act forbids any person to deposit or allow to flow into any navigable water, or water that flows into navigable water—unless otherwise disposed of—any matter poisonous, noxious, decomposing, refuse or waste. Every private corporation convicted would be liable to a fine of not less than \$200 and every day during which the offense continues. Six months will be afforded corporations that now break the law to cease doing so.

B.C.'s New Timber Royalty Legislation

Outline of the Measure Presented by Minister of Lands in the Legislature—Royalty on a Sliding Scale to Grow with Lumber Prices

The new Timber Royalty Bill for the Province of British Columbia which was recently introduced in the Provincial Legislature was discussed on February 13th, by Hon. Wm. R. Ross, Minister of Lands, who spoke in part as follows:

A Bill has been introduced, and is now pending before the Legislature, which will settle the vexed question of royalty re-adjustment. This Royalty Re-adjustment Bill does these three things:

It gives a fair and just measure of certainty to timber license holders, and therefore stability to our lumber industry. It somewhat increases present returns to the government from timber royalty, and it provides for greater and greater increases in the future; by a profit-sharing principle—a recognition of the right of the people of British Columbia to share in the increasing value of their own timber property.

This bill is the product of several years of agitation and of more than a year of definite consideration of this whole royalty problem. This consideration has involved a thorough and practical investigation by the Forest Branch into the lumber values and costs, whose difference, less a margin of fair profit to the lumber operator, spells stumpage values.

Royalty Question

I have never looked upon this question of royalty increase as a mere question of money raising; I have looked upon it rather as a fundamental question in public forest policy. To me it has had three great purposes in view, not the object of taking from the industry the highest possible money revenue. These three great purposes are as follows:

First, so to settle this royalty question as to insure, to the highest practical degree, the welfare of all the people in British Columbia as far as the forests contribute to their welfare, and that is very far. Second, so to handle this question that the Government co-operates to the fullest legitimate extent in establishing and maintaining a permanent and profitable lumber industry in our province; and third, so to handle this matter, as to make forest conservation not a remote, but a nearer and more probable thing upon all timber limits.

For in the last analysis, the test of the success of the forest policy of this Government will lie, not merely in the present productiveness, but still more in the future productiveness of the forests themselves.

We have in our province vast areas of mountain forest land suited best to forest purposes. It is obviously the direct duty and responsibility of our Government to keep that forest land under productive growing forests; and that conclusion has been ever prominent in my mind in this whole royalty matter.

You will observe, therefore, that the increased revenue from the forests provided for by this bill has been treated as less important than other and more vital public considerations. That the bill will increase revenues is a happy result; but I would consider it an unhappy result were it accomplished by violation of any one of the three great principles I have just set forth; the welfare of the people, the welfare of the lumbermen, and the welfare of the forests.

This bill is not the result of the application to British Columbia wholesale of some plan worked out in some other country. I have taken into account the approach which all other countries have made upon this problem of disposing profitably of the public timber. From some I have gained help; from others I have gained nothing; but in the aggregate this bill typifies the independent, original consideration of our home problem. It is not a borrowed measure, taken from somewhere else with the hope that it may fit in with our local conditions. It is a bill drafted in British Columbia, based on a knowledge of British Columbia conditions, and my belief is that it will work to the satisfaction of British Columbians.

Forest Conservation

This is not merely a royalty measure. It is a forest conservation measure; the second great forest conservation measure which has been inaugurated by this Government in recent years. First came the inauguration of our Forest Branch which is already an alert, efficient instrument, directed by alert, efficient, zealous men, in the development, protection and wise use of forest resources.

Now comes, as I hope will come, the passage of this Royalty Bill, which settles, and settles definitely and settles fairly, the uncertainties which in recent years, both for operator and investor, have disturbed somewhat the stability of the finances of our lumber industry.

I hope that in the years to come, and not in the remote years either, we may take further great steps forward in our forest conservation policy. That policy, as I see it, has these great objects in view:

To protect our forests; to get them wisely and profitably used; and to keep them coming. The last calls for a fair and reasonable measure of practical forestry. I have some plans for that from which I think I will get, with profit to the lumbermen, the better assurance of a second crop upon the timber limits; and within a year I shall be ready to announce those plans. But before doing so I will discuss them, and modify them if necessary, and if I am convinced of the wisdom of the modifications, will work them out with the British Columbia lumbermen themselves.

I see no reason why British Columbia should not lead all other parts of North America, and even our progressive friends to the South of us, in practical forest conservation. I realize that we will have to move rapidly to accomplish that result. But I am entirely willing, in fact I am eager, to enter into such friendly rivalry with forest conservation as our goal.

The Royalty Bill comprises these four things: It fixes the royalty increase for 1915, and establishes a level of lumber prices on which future increases will be based. It provides seven five-year periods for royalty adjustment; and it provides that for each of these periods a given percentage of the price increment for lumber shall be added to the royalty. This percentage is twenty-five per cent. for the first five years, and rises gradually to forty per cent. for the last five-years period. The fourth of the accomplishments of the Royalty Bill is to re-adjust the rentals between the Coast and the interior, and fix them for the whole period of the Act. I will take up each of these four principles separately, and their application, and will attempt—so far as practicable—to forecast their results.

The Royalty Increase

First, the royalty increase for which the bill provides takes effect on January 1, 1915. The bill provides that these increases shall be, for Coast lumber, from the present royalty of fifty cents to seventy-five cents, an increase of fifty per cent. This increase, however, is not applied arbitrarily, but is the result of raising the royalty on different classes of logs in a proportion which puts the highest increase on the best logs, and no increase at all on logs of such low value that the increase would mean that they would be left lying in the woods. That plan is the particular application of the broad principle of forestry; to encourage the utilization of low grade material which otherwise might be wasted, and charge a fair rate of increase upon high grade material, which in any case would be utilized, because in utilizing it lies the chief margin of profit in logging.

The royalty increase in 1915 provides that in the interior, royalty shall be increased by the use of the B. C. scale instead of the Doyle. That means an increase of probably forty-five per cent. in royalty to the Government, and, as far as I and my advisors can figure it out, is an equitable adjustment of royalty between the Coast and the Interior. In the Central and Northern Interior, regions of great prospective timber development, the Government has imposed in the Royalty Bill a royalty charge of sixty-five cents per thousand board measure. This again, in my best judgment, fairly represents the relative conditions as to lumber values in that region, as compared with the interior and Coast.

The First Five Years

These three increases take place in 1915, and hold good for five years, or until 1920. Then comes the first re-adjustment based on increase on the actual lumber price of \$18 fixed by the bill. But before we take that up let me say a word about the general level of this royalty increase for the first five years.

Are they too high? The central facts of this adjustment must be kept well in mind. In my judgment they are not too high. They merely take up a certain amount of slack, and they impose upon the industry so small an increase for its raw product that they cannot fairly be claimed to disturb existing financial conditions. They pre-suppose—as any reasonable man must pre-suppose—that this period of depression through which we have recently passed, and from which we are already emerging, is a temporary thing. They pre-suppose that in British Columbia, as in the rest of the world, the price of lumber will not continue to fall spasmodically; and that the general tendency will be up and not down.

Are they too low? My belief is they are not too low. They might have been higher, for the Government had the whip hand, and they might have been two or three times as great, and still have been well within the limits of our power. But, as I have said before, this plan and policy of royalty re-adjustment is not merely a money raiser for the present, not a financial emergency measure to wring the utter-

most farthing out of the lumbermen. Moreover, the financial condition of our lumber industry at present is not a very rosy one. In the aggregate, some of our mills are making a little money, and some are losing a little money, but the general average is to break a little better than even. This is at the present moment. A little better than an even break; that is in general the lumberman's situation to-day. If that were made by an ill-considered royalty increase merely an even break, or a little below an even break, the result would be to deal a body blow to an industry not altogether upon its feet, although rapidly approaching that condition.

Progressive Increase

Now I will take up the progressive increase in royalty based on percentages of the price increment above the base level selling price of \$18. As you will observe, these increases are made, subject to the result of governmental investigations, and are applied at the end of each five years, to hold good for the next five years. Therein lies the great principle around which hangs this bill; the principle that the Government, the people, and the lumbermen are co-operators in an industrial enterprise; the principle that there should be frequent re-adjustment based on the actual facts, so that timber royalty may keep pace with the growth in lumber values. So far as I am aware no such principle has ever been enacted before on so broad a scale by any other nation.

The Government began by taking for the first five years twenty-five per cent. of the increment in the selling price of the lumber over \$18. This is true profit-sharing. The Government says to the lumbermen, in this bill: We will play fair with you; the more you get for product the more we will charge. But we will not take all of the add-

ed increment, we will take a fair part leaving to you good returns for your enterprise, your capital investment, and your risk. If the price of the product does not go up we will take no more than we are taking now. We will play fair.

The Rentals

Now take up the fourth provision of the bill, which adjusts and fixes the rentals of the whole period.

Why fix the rental? the open minded man might say. Why not leave that open? What is the use of tying it up for such a period? To such a man my answer is this: Every British Columbia lumberman is fairly entitled to have the rentals fixed during this period of the Royalty Re-adjustment Bill, and during the period that this profit is shared between the Government and him.

What will be the general effect upon revenue present, and future, of this bill? Coincident with its enactment this bill will increase our timber royalty by somewhere between \$50,000 and \$60,000. By 1924, if the annual lumber cut increases on an average at the conservative figure of five per cent. per annum, and lumber goes up moderately to \$21 per thousand feet, this bill will increase our royalty revenue to close on \$2,500,000 a year. After that it will go further, but that is far enough to estimate.

Hon. Mr. Ross concluded with an eloquent reference to the duty of the government as stewards of the natural resources of the province.

In explanation of Hon. Mr. Ross' reference to rentals it may be added that the new bill provides that the annual rental west of the Cascade mountains shall be \$140 per square mile, and the annual rental east of the Cascades, including the district of Atlin, \$100 per square mile.

Western Retailers' Annual Meeting

Association's Usefulness Strongly Illustrated During a Year of Trade Depression—
A. B. Estlin Elected President for 1914

The 23rd annual convention of the Western Retail Lumbermen's Association of Canada was held at Winnipeg on February 18th and 19th. A directors' meeting was held on February 17th to prepare for the general convention. On Wednesday morning the convention was opened by the reading of the minutes, after which the president, Mr. Joseph Mergens delivered his address, in which he noted that the Association had held its own in numbers during the year, although they had not made as much progress as they had hoped for in consideration of the number of new yards that had been opened. There was greater need to-day for Association work than ever before and he urged all members to do their utmost to stimulate its growth. New conditions were developing which made the value of the Association much greater. Competition was becoming more active and the efforts to do away with the middle man were becoming more vigorous. For his own part he did not expect that the move to obliterate the middlemen would be successful, as it would be detrimental to the interests of the consumer as much as to those of the retailer. He did not believe that a cash-on-delivery carload trade with the farmers could be carried on satisfactorily. A customer who dealt with a local yard saw what he bought before he paid for it and this was an advantage which would always work in favor of the retailer and against the carload trade. Nevertheless, there was great necessity for educating consumers in regard to this particular point. One of the chief matters to which they must also give their attention was the complete satisfying of their customers. A satisfied customer was a very valuable asset to a local yard.

President Mergens spoke also of the Saskatchewan lien act which had been in danger some time ago of being repealed. The value of the Association had been definitely demonstrated in this case because it had instituted a campaign which resulted in the lien law being upheld and amendments made to it which rendered it even more advantageous to the lumber merchants. This was a definite illustration of the value of the Association to its members. Many other advantages might be mentioned, among them the information available through the Association's credit system and the benefits secured from its mutual insurance company, and also from the information which it afforded in regard to the best methods of taking care of stock.

Association Holding its Own

Secretary Alan M. Stewart, in his report, said that the year's work had been carried on without drawing upon the Association's reserve fund. Forty-one new members had been added to the list which had balanced the number of members lost through suspensions and yards sold. The Association had made efforts to bring about the adoption of reciprocal demurrage. They had not been successful in this, but they believed that there were now indications that the Dominion

Board of Railway Commissioners were leaning towards the adoption of such a system.

The year 1913, Mr. Stewart, said, had been a hard one for the lumber trade, owing to the financial stringency prevailing throughout the west and the retrenchment in expenditures which resulted. The lumber trade, however, had come through fairly well and its members had learned a great deal, so that they were now in better shape than ever before. Mr. Stewart drew attention to the mistake, so often made, of over-crowding new territories with the retail yards and urged that the Association should give its attention to the working out of some remedy for this difficulty.

In the collection of claims from the railway companies the Association had had better success during 1913 than in previous years.

Mr. Stewart referred to the growth of the grain growers' organizations and to the fact that they had entered to some extent into the lumber business. This threatened a formidable kind of competition. Farmer's organizations were growing very strong and they were opposed to the middleman. This was a development which the members of the Association should watch carefully, with a view to meeting the situation promptly.

The special service department of the Association had been of much value to the members during the past year in looking after many of their individual complaints. Much had been done in the direction of preventing delays in deliveries on shipment and many other benefits had been secured which could not be had outside of the Association. Mr. Stewart also emphasized the advantages of the protection furnished by the Association's mutual fire insurance company.

Mr. J. E. McFee, assistant secretary, of Moose Jaw, made a brief report stating that the year's work in his district had brought fairly favorable results.

At the Wednesday afternoon session an interesting address was delivered by Mr. J. M. Brayley, organizer of the Saskatchewan branch of the Retail Merchants' Association of Canada, who explained in detail the objects of that Association. He asked particularly for the co-operation of the Western Retail Lumbermen's Association in keeping track of "dead beats." Considerable discussion followed Mr. Brayley's address and the members concluded that it would not be advisable at present to affiliate with the Retail Merchants' Association, although individual members might use their own judgment in regard to becoming members.

Retailers Need More Co-operation

Mr. Brayley also urged that a more friendly feeling among retail lumbermen in each town was of great importance. Customers often ran bills at one yard, when they were indebted to another in the same

town. Yard men were not on friendly enough terms with each other and would not advise each other of their customers' indebtedness.

In regard to this matter, one of the representatives present urged that their should be co-operation, not only among merchants, but between merchants and their customers, with a view to developing a better understanding. He did not believe that the time was ripe for the introduction of a cash business in Western Canada.

An interesting discussion then took place in regard to the competition of Coast mill men, some of whom were planning to send car lots of lumber to consumers at prairie points, where they could not sell through retailers who patronized other mills. A statement was made that two strong companies were now being organized at the Pacific Coast to handle this carlot business.

The rest of the session was devoted to a general discussion of methods for improving conditions in the lumber trade. One of the strong points brought out was the danger of inducing farmers to assume too heavy obligations in buying lumber and other materials, without sufficient regard to their ability to pay.

At the Thursday morning session the discussion upon "Means of

Bettering the Lumber Trade Conditions" was continued. The Manitoba lien act came in for criticism. As it now stands, this act makes it necessary to file a lien within thirty days, and for the merchants to sue within ninety days. It was decided that the government should be asked to extend the time for suing to twelve months.

Officers for the Current Year

The election of officers resulted as follows:—President, A. B. Estlin, Melita, Manitoba; vice-president, H. Meilicke, Saskatoon, Sask.; secretary-treasurer, Alan M. Stewart, Winnipeg; assistant secretary, J. E. McFee, Moose Jaw.

On Thursday afternoon, Prof. S. A. Bedford, Deputy Minister of Agriculture for Manitoba, delivered an interesting address on diversified farming and its effect upon retail trade.

An interesting address was delivered by John W. Barry, Cedar Rapids, Iowa, upon the "Economic Necessity of the Retailer." On Thursday a social evening was held at the Winnipeg Industrial Bureau and plans were arranged for the Hoo-Hoo Concatenation next September. This was followed by a smoking concert which brought the convention to an end.

Annual Report of B.C. Chief Forester

Revenue of Branch Greater Than Ever Before—Important Statistics of Production, Prices, Markets, Etc.—How U.S. Lumber Competed

The report of Mr. H. R. MacMillan, Chief Forester of the Department of Lands for the province of British Columbia, for the year ending December 31st, 1913, has just been issued, and is one of the most interesting reports of its kind that have appeared.

The public revenue of British Columbia, according to this report, is the largest of any province in Canada, being nearly \$27 per inhabitant, which is three times as great as that of the next largest province Manitoba, and over seven times that of Ontario. By far the most important item in this revenue is the portion derived from the provincial forests. In spite of financial stringency during the past year, the branch collected, during the twelve months ending December 1st, a revenue breaking all previous records and amounting to \$2,832,788 which is \$229,669 greater than the revenue for the twelve months ending December 1st, 1912. For the twelve months ending March 1st, 1914, the Chief Forester expects to show a total revenue not far short of \$3,000,000.

Diagrams which accompany the report show that the forest revenue of British Columbia amounts to \$6.63 per head whereas that of Ontario is only 79c per head, and Quebec 77c per head. Another diagram shows that royalties from timber cut in British Columbia during the twelve months amounted to \$489,377, whereas those of Ontario amounted to \$1,339,957, and those of Quebec to \$1,173,393.

Private timber lands, which are assessed for taxation at 2 per cent. on their valuation, showed a total acreage in 1913 of 922,948, being 48,233 acres greater than during 1912. The average value per acre was \$9.02 which is an advance of 42c per acre as compared with 1912.

The total forest revenue, including taxation on Crown granted timber lands for the twelve months ending December 1st was \$2,999,579. The estimated expenditure for the branch, for the fiscal year ending March, 1914, is \$245,754.

The forest protection fund to which the government and the timber owners contribute equal sums is estimated for the year ending March, 1914, at \$350,682.

Importance of the Lumbering Industry

Dealing with the lumbering industry and its importance to the province the report says:—

Even to-day, with the sea-going export trade in lumber still in its infancy and the available market for British Columbia timber practically confined to the Prairie Provinces of Canada, the lumbering industry constitutes the commercial backbone of our forest Province. The census returns shows that half our industrial capital is invested in the lumbering and wood-working business; that half the pay-roll of the province is derived from our forests; and that 37 per cent. of our annual production of wealth comes from that same source.

Important as is the part played by our lumbering industry to-day, it is obvious, in view of the immense timber resources of the province, that its development is still upon a comparatively small scale. Outside the Prairie Provinces it has practically no effective markets. Its cargo trade in 1912 was under 52,000,000 feet. The whole shipment to the east of Canada is confined to a few specialties, such as dimension timber and small quantities of high-grade material; and but a thin trickle of business in shingles and high grades has been possible with the United States. Chaotic overproduction has resulted from this shortage of markets, since the quality and quantity and

accessibility of our provincial forests have proved an overwhelming temptation to lumbermen to enlarge their mill capacity beyond current needs. Through a combination of circumstances even the near future may be expected to see a very great improvement in the conditions of the industry. Whatever differences of opinion there may be as to the exact commercial effects of the opening of the Panama Canal, it is beyond dispute that a general broadening of our markets for lumber will result. Sooner or later, moreover, the western freight-rates question must be decided in favour of the West. Panama in itself will attract shipping and make British Columbia more of a distributing centre for Western Canada, a position that will, of course, be immensely strengthened by any equalization of the rail-haul rates.

In the collection of forest revenue the returns of the Forest Branch show a cut of 1,457,000,000 feet, board measure, for the year 1913, an amount which is nearly equal to the combined output of the Provinces of Ontario and Quebec for the previous year. If the large amount of material used in railway construction during the year be included, British Columbia's total cut would approach 2,000,000,000 feet. The number of saw and shingle mills exceeds 425.

Logging Inspection

There were 794 logging operations in progress during 1913 on timber lands on which a royalty or tax had been reserved to the Crown. The product of these operations for the calendar year 1913 was, approximately, 1,348,000,000 feet of logs, 82,805 cords of shingle-bolts, 3,030,010 lineal feet of piling, 35,000 mining-props, 15,500 cedar posts, and 5,093,718 lineal feet of cedar poles. The loggers of British Columbia established a new record both for number of camps operated and quantity of timber produced.

Referring to the importance of efficient disposal of slash the report says:—

It is admitted that clean logging will depend upon the lumber market, for when there is no market for low-grade lumber the logger will feel disposed to leave low-grade logs in the woods. The general study which has been made up-to-date shows, however, that even under the market conditions which have governed during the past few years a great deal of material has been left to rot which could have been taken out profitably. The truth of this statement is borne out by the varying standards of different loggers. Some of the most successful in British Columbia have made a study of clean logging, and by cutting low stumps, exercising care in falling so as to reduce breakage, carrying log-lengths so as to take the full merchantable length of the tree, clean yarding, and using inferior logs for construction work and fuel have greatly increased the productivity and profits of their operations. On those operations where such business principles have not yet been adopted there is a tremendous waste of timber and consequent loss to the Government in royalty revenue. It is the aim of the Forest Branch to continue to work steadily towards a reduction of logging-waste by gradually bringing all operators up to the standard of utilization set by the most successful among them. This will become the most important feature of logging inspection.

During the year, fifty-nine timber sales, covering 22,775 acres (with a total estimated stand of 208,615,251 feet B.M.) were advertised at upset prices ranging from \$2 per thousand feet downwards, in addition to the usual royalties and renewals. The sales represent a total asset of \$238,476, with a further \$147,640 under advertisement.

Export of Forest Products

A lengthy section of the report deals with the export trade in forest products, regarding which it says in part:

The life of the timber industry of British Columbia depends upon the profitable export of forest products from the Province, for the local population uses less than one-fifth of the timber annually produced, and the other four-fifths must be exported. The situation has become more acute during the past year or two owing to the decrease of building operations in the larger towns and cities of the Province, and consequent falling off in the local demand for lumber.

During 1913, 120 permits to export logs were issued. The total quantity exported was 58,752,678 feet, which compares with previous years as follows:—

	Feet B.M.
1911	47,000,000
1912	53,280,375
1913	58,752,678

The quantity of each species exported from British Columbia during 1913 was:—

	Feet.
Cedar	22,678,030
Spruce	1,759,131
Fir	509,149
Pine	391,037
Hemlock	3,369

Total

25,340,716

Species unidentified, 33,411,962 feet (exported at 50 cents per thousand).

The quantity and proportion of each grade has been:—

	Quantity	Per Cent.
Grade No. 1	1,108,087	14
Grade No. 2	2,759,693	36
Grade No. 3	3,829,238	50

The export of smaller unmanufactured products is growing. For instance, there is keen market in the United States, on the Prairie, and in Eastern Canada for cedar poles, and the export of cedar poles for the year amounted to 2,562,942 feet. About 2,000,000 lineal feet were shipped from the Cranbrook and Nelson Forest Districts to the Prairie, the Central States, and Ontario; 500,000 lineal feet were shipped by boat from the tide-water camps to Central and Southern California. The total value of pole shipments was \$179,406. Again, the Cranbrook and Nelson Forest Districts constitute the chief source of fence-posts for the Prairie, and furnish a large proportion of the railway ties and mining props used annually in Alberta and Saskatchewan. The production of these timbers has become an important adjunct to the lumber business in these districts and makes possible the complete utilization of all material. The exports of these products from these districts for the year were:—

	Quantity	Value.
Fence posts	11,190 pieces	\$ 57,400
Railway ties	1,128,270 "	451,308
Mine props	6,000 cords	36,000

The total value of the logs, poles, piles, posts, ties, and props exported from British Columbia in 1913 was \$1,321,640.78.

The Export Markets of British Columbia

The most important item in British Columbia's trade is the export of manufactured timber. The Province has been so favourably situated for this trade that it has grown up without any form of Government or public assistance or encouragement. The three chief natural markets are the Canadian Prairie, the United States, and Eastern Canada, and the sea-borne cargo trade.

Up to the present the Canadian Prairie has been the most important market, for it has taken three-fifths of the timber-production of British Columbia, and the majority of the sawmills in British Columbia have been built for this trade. An important feature of this market has been that, whereas the other export markets open to British Columbia mills will take only the highest grades, all grades may be shipped to the Prairie. During the past five years there has been keen competition in this direction. The lumber manufacturers of Western Ontario ship 50,000,000 feet per year into Winnipeg; the spruce manufacturers of the North (favoured greatly by freight rates) distribute about 225,000,000 feet annually; and the manufacturers of the Western States (whenever conditions are bad on the home market) unload 140,000,000 to 270,-

000,000 annually in the Canadian Prairies. The shipments of timber into the Western Provinces from the United States during the first eleven months of 1913 were about 50 per cent. less than during the same period in 1912 (which was the record year), and were not so great as during the same period in 1911. The exact shipments in comparison with 1912 and 1911 are shown in the accompanying table.

Eastern Canada Markets

Many British Columbia lumber manufacturers believe that the time has come to develop the markets of Eastern Canada and the United States to a greater extent. The great lumber-consuming districts of this continent lie around the Great Lakes and along the Atlantic Coast, and the recent removal of the United States tariff on all lumber, places British Columbia manufacturers in a position to compete on free terms with that great market of nearly 100,000,000 people. Up to the present, shipments to Eastern Canada have consisted of a few million feet of Douglas fir annually, for large construction timber, railway-car building, public works, boats and scows; together with cedar shingles and cedar finish. Similarly, shipments to the United States have consisted of shingles for the middle west and cedar finish for the New England States. Both in Canada and the United States there are many markets which can, and sooner or later will, be supplied from the United States. Douglas fir dimension timber in large sizes for big construction will find sale in competition with southern pine. Our shingles, moreover, can compete everywhere, while Douglas fir flooring and inside finish, cedar siding and clapboards are on an equality with the best products of the east. The fight for larger markets will be greatly helped if favourable rates are secured through the Panama Canal. It cannot, however, be successful until the products which British Columbia lumbermen are ready to sell are made known in the buying centres of the east. Eastern people are surprised when they visit the Coast and see the beautiful effects produced in house interiors with British Columbia woods. They will buy this timber if it is put before them in the east.

The cargo trade of British Columbia has shown sign of growth during recent years. It constitutes on the average less than 5 per cent. of the lumber trade of the province, and only three or four mills are engaged in it.

The following table shows the comparison between British Columbia and the Western States:—

	From Wash., Ore., Columbia River and South	From British Columbia
Australia	177,556,404	25,788,248
West Coast of South America	103,813,354	6,683,752
China and Japan	67,174,100	2,710,683
Mexico and Central America	32,118,885	552,492
United Kingdom and Continent	16,555,058	12,019,659
Africa	8,622,430	2,158,700
Other foreign ports	47,564,301	1,598,522
Philippines	16,564,301
Hawaii	62,408,942
East Coast of U. S. A.	4,699,000
	537,074,775	51,512,056

In addition to these cargo shipments, British Columbia exported 53,000,000 logs to the State of Washington.

The total timber imports of the principal countries of the world

IMPORTATIONS FROM U.S.A. TO MANITOBA, SASKATCHEWAN, ALBERTA, AND BRITISH COLUMBIA.

Lumber, Laths, and Shingles from January 1st to November 1st, 1911; January 1st to November 1st, 1912; and January 1st to November 1st, 1913.

	1911.			1912.			% Increase 1912 over 1911.	1913.			% Decrease 1913 over 1912.
	Feet B.M.	Value.	Aver. per M.	Feet B.M.	Value.	Aver. per M.		Feet B.M.	Value.	Aver. per M.	
Planks, boards, etc., dressed one side not dutiable	190,768,000	\$ 2,324,994	\$12.13	207,762,000	\$ 2,377,262	\$11.44	9	106,299,000	\$ 1,552,760	\$14.61	49
Sawn boards, etc., dutiable	31,348,000	390,866	12.11	49,291,000	645,670	13.09	53	17,843,000	303,971	17.04	64
	222,116,000	\$ 2,715,860		257,053,000	\$ 3,022,932			124,142,000	\$ 1,856,731		
Laths	58,220,000	\$ 134,793	2.31	63,720,000	\$ 134,624	2.11	9	32,996,000	\$ 78,361	2.37	48
Shingles	17,206,000	32,781	1.90	82,887,000	152,402	1.84	381	3,400,300	65,153	1.92	50
		\$ 2,883,436			\$ 3,300,958				\$ 2,000,245		30

are annually about 7,507,360,000 feet B.M. British Columbia supplies but 1 1-3 per cent. of this total, though no country is better equipped to be an important factor in the world's timber trade, the annual growth of merchantable material in the province being several times the annual cut, and large quantities of it being accessible and cheap to log. Though at present the sawmill capacity of the province could supply double the present trade, this unfavourable condition cannot be expected to continue when the Panama Canal is open and the new transcontinental lines have trebled our facilities for eastern shipment. There are many timber holders prepared to invest more money in logging and timber manufacturing enterprises as soon as the market for their product develops.

Finding a market for more timber either in Eastern Canada, the United States, or the overseas countries is a long, slow process. Nevertheless, the increase of the industry and settlement of the province depends largely upon it, as does any increase in the Government revenue from royalty. Finding a market involves making the commercial timbers of British Columbia known to the purchasers of the world, a matter that is (after fire-protection) the most important work of the Forest Branch, which would naturally work out in conjunction

with the lumber manufacturers of the province the details of a campaign of trade extension such as is necessary. Representations have already been received from lumber manufacturers pointing out that their efforts to establish a trade with Eastern Canada would be greatly assisted if an exhibit of fully manufactured and finished British Columbia timber were established by the Government at some central point. I heartily concur with such a suggestion. No opportunity should be lost for placing exhibits of manufactured British Columbia timber in the lumber-buying centres of the world.

The total damage caused by forest fire during the year was only \$18,354, as against \$313,273 in 1912. The damage to standing forest was only \$4,387, as against \$200,000 last year. Fires covered and damaged to a greater or less extent less than 6,000 acres of merchantable timber and 2,000 acres of valuable second growth; 2,535 acres of slash was also burned, making a total of 10,270 acres, as against over 150,000 last year. The damage to other forms of property totalled only \$13,967.25, as against \$113,273 last year. Over 60 per cent. of this was due to a single fire in Cranbrook District which destroyed a large quantity of saw-logs on skidways.

Talks With the Lumbermen of British Columbia

No. 6—By Douglas Fir

One Hundred "Don'ts" for Incorporators and Others

Don't "float" your stock, just subscribe and pay in sufficient of real money for the undertaking. Webster passes upon the word "float" as applied to stock, as correct. Personally, I think it too suggestive.

Don't expect dividends, nor feel disappointed if you do not receive them on capital that has never been invested.

Don't expect, when working on borrowed capital to pay a high rate of interest on same, and a large dividend too. That would be equivalent to double dividends.

Don't incorporate as a lumbering concern until you have first acquired some knowledge of the undertaking.

Don't, after you have incorporated, appoint a directorate having less familiarity with the undertaking than a politician has with the pulpit.

Don't launch the undertaking with an unqualified man in charge. For though he may have many capabilities, yet if he is not a lumberman he is not qualified for this one. You would not appoint a Master of Languages to teach Arts and Science. Nor yet a Greek Professor to teach the Modern Languages.

Don't ask the man upon whom you have conferred the honor of piloting your undertaking through the uncertain channels of irregular competition, to carry so much canvas that when his ship approaches the dangerous places along the way it will become unmanageable.

Don't over-capitalize your undertaking; neither is it wise to provide too much real money within easy reach of such undertaking. Start it right, and then let it be self-supporting. It takes money to operate a lumber business, but sometimes too much is as bad as too little, if you are looking for profits.

Don't be deceived. The lumber business is not a get-rich-quick scheme. It is a legitimate undertaking, and should be entered into as such, treated all the way through as such, and conducted as such. If you want to get rich quick, and only want to use the lumber business as a stepping stone, we, who have legal claims upon the industry, would respectfully invite you to step on something else, as craftiness of that kind brings reproach upon the business, and everybody concerned therein.

Don'ts For Managers

Don't undertake the management of a lumber business with no better qualifications for the position than having been successful in something else of an altogether different nature, or knowing some of the incorporators. There are things which have to be learned in the lumber business, that have never been written in books, and cannot be learned in a day, nor yet in a lifetime in association rooms.

Don't force your ideas, gathered at association rooms upon your heads of departments without first consulting them and getting their views. They might show you that your views would not suit your case at all, and that it may have been a Mutt and Jeff joke with your associates.

Don't ignore those who have to bow in submission to your will. It may be that they know more about the business than you do, or perhaps more than you will ever know. Get next them, and learn of them, if you can.

Don't question the head of a department on any part of the work

in a way that would indicate that you were testing his knowledge, when all the time you are only trying to steal information from him for your own notebook. He likely suspects your motive.

Don't, when the head of a department offers a suggestion in a right spirit, cut him short by telling him that your mind is already made up. It is a silly judge who will attempt to render his decision before the evidence has been presented.

Don't be averse to learning from a subordinate. His garments may be dusty, but he may own a store of diamonds in the shape of knowledge, which you will never be able to possess.

Don't let a man go out from your employ under a charge of incompetence or any such unsavory distinction, and then later take him back at more money, or under improved conditions on your part. It shows weakness and incompetence, but not where first alleged.

Don't forget that the time to insert the bond of good-fellowship and loyalty between yourself, your company, and your men is when their condition of subserviency has made their conception penetrable. You will find such bond the most enduring, notwithstanding adverse vicifications.

Don't try to squeeze the men when work is scarce. Their day will come again, and they do not easily forget.

Don't allow your office to be closed at 5 o'clock when your neighbor keeps his open until 6. If you do, you must not feel disappointed, nor accuse him of wrong doing if he bags more game than you do.

Don't forget when you are planning your holiday, or your trip to Europe with full pay and expenses, that the man upon whom you have condescended to confer the honor of carrying your load and his own too, though he may courteously accept the situation as inevitable, yet feels the injustice of your generosity concerning him.

Don't place in the hands of an incompetent, or one addicted to the habit of "butting in," any commission of authority. There are enough good and competent men to fill such places. If you do not secure them it is your loss, and your competitors gain. Such "butterers in" can do more to disrupt an otherwise good organization than they can ever undo.

Don't bother about saying your prayers, if you have been voted an increase in salary by your directors, and then in turn you have reduced the wages of your men to save the amount back for your company. The Lord will not waste time listening to such prayers.

Don't waste time in trying to harmonize the causes which enable you to begin work at 10 a.m. and then forget to go back after noon; with those that compel your workmen to begin at 7 o'clock, and work until 6. There is no harmony or justification in this.

Don't go away to see the ball game, or the lacrosse match under full pay, and leave your superintendent to explain to your men why it is impossible to allow them to go when they do not expect pay for it. He hates to do this, and besides it makes him feel silly.

Don't, when you have made it a common practice to cease work at noon on Saturday, but collect full pay, refuse the men working for you an occasional Saturday afternoon off when they are willing to lose their time.

Don't, when you discount all your papers, or pay interest on all

bills payable, allow accounts owing to your company to run without interest.

Don't let people "use" you, or your company, just for the sake of being known as a good fellow. It does not pay.

Don't advertise in your Trade Journal. If you do, the customer might find a more direct means of reaching you than through the medium of two or three middle men. But if you do advertise,

Don't take the trouble to tell the public what you can do in the way of serving its demands in your line. Just get your name in, and tell who the officers of your company are. That will do, unless you want results from the advertising.

Don't think about your balance sheet until the end of the year, because it cannot be taken out until then anyway, but when it is finally out,

Don't fail to raise a furore because it is not up to your expectations.

Don't, whatever else you do, take any of the blame upon yourself when you are called upon to explain. Just blame it upon the general incompetence of your subordinates, and

Don't fail to make use of this opportunity to show how, when you have been thinking and worrying about the business day and night, their thoughts have been centred upon ball games and such like.

Don't try to inaugurate any system that would enable you to tell what the costs of your different products are as time goes on, unless you are anxious to know before the end of the year whether you are selling at a profit or a loss. For you know you can find this all out by the balance sheet at the end of the year, and thus save lots of trouble.

Don't mind if you are using a better class of logs than is necessary for the kind of business you have in hand. If you decide that they are the right logs to use then it must be so, even though your neighbor is filling the same class of orders from cheaper logs. Your sales are made with less effort, but what of your profits?

Don't jump. Anyone who has had any experience on the rivers and streams in the eastern provinces has seen or heard of the "Jumping Frenchman." If a companion, riding down the stream on a log with him would say "jump" he immediately jumped, with as little hesitation as a dog jumping in the water after a chip. It matters not where he is, if someone says jump he jumps. Now I have often thought that while it looks ridiculous in the extreme for a man to jump in that way, without being able to think what he is doing, yet we sometimes view it in a different light when it is brought home. To illustrate: A certain number of men can load a certain number of cars in a week, which number fully takes care of your output. Telegrams come from irate customers, to whom false promises have probably been made, asking for car numbers for several orders. Unintentionally perhaps a word is dropped which brings the matter to your attention. You investigate. The stock is in the yard, but the sales manager forgot to give these orders to the shipper in their proper successive order. You "storm" about, and order the shipper to get on extra men quick and get those cars out. He says he does not know where to get men, and you tell him to go to Helen Hunt for them, and when he gets them keep enough to keep his work up. The shipper gets "wise," doubles up his crews and gets the cars out in three days, and then keeps his men in hiding, or doing unnecessary work for the balance of the week for appearance sake. You jumped, didn't you? Doubled your costs right there without thinking. Made a nice hole in your balance sheet. What I say, I say unto all; don't jump, but think.

Don'ts For Superintendents

Don't accept the responsibility of such position unless competent. Much importance attaches to this position, and if you have not the qualifications, you are standing in the way of a good man.

Don't forget that you are the medium between the office and the men, and that you must be absolutely fair to both.

Don't take sides with any faction, or element, until you are sure of the merits of the case, then exercise the authority vested in you on the side of right, and without fear, or hope of favor.

Don't talk to one man about another, neither ridicule your employer to the men, nor the men to your employer, nor tolerate gossip in any form.

Don't be above considering suggestions from your men if they are offered in a right spirit, and

Don't fail to acknowledge such offerings with thanks.

Don't think that if a man offers you a suggestion he is after your job. He probably never thought of such a thing, and if you are filling your position properly you need not worry.

Don't allow any friction, or squabbling amongst the heads of departments, nor amongst the men. Unless harmony exists, and all understand that they are working in one common cause, best results can't be attained.

Don't assume that you are the brains of the whole works, but use what brains you have unsparingly for the good of the whole works.

Don't shift your disagreeable duties on to the shoulders of a fore-

man. You know how you view this when the manager loads his upon you.

Don't let the office "run" you. Your duties are plainly known to you, and you, and you only are responsible.

Don't blame the foreman if you see a piece of timber worth a dollar or two cut off the end of a stick and sent to the refuse burner. Find out first the reason. You will probably trace it to the "rush" order man.

Don't insist upon keeping more facts and figures (except for your own information) than the manager wants. It may be that a friend of his preceded you, and too many figures might be objectionable.

Don't let your nerves be troubled if the manager goes after you about troubles incidental to your position. Just remember that it is your duty to listen to all the troubles of whatever nature they may be in or about the works, and to find a solution of all the problems, and if the manager chooses to come along and pour on some more why should you worry?

Don't worry the manager with your troubles, but remember that he has problems of his own. Help him if you can, but don't bore him.

Don't show undue familiarity with your men. Be courteous, and fair with them in all things, but show an unmistakable firmness as well, and be just as ready to acknowledge good in them as to reprimand them for evil.

Don't minimize the importance of your position. If you are the right man for the place you are not likely to have much trouble, or make much noise in the performance of your duties; but nevertheless, they are arduous and technical, and many of the things which you have to contend with are known to but few. The man with the big noise may seem to the uninitiated to be doing more than you, but noise is not a necessary element of success. You must weigh carefully the things you do, and never "jump" at anything.

Don'ts for Sales Managers and Salesmen

Don't accept this position with the feeling that it was offered to you because you were the only man big enough for it. It may be that the manager was mistaken in you, or perhaps he took pity on you, or was interviewed by some friend in your behalf, or again he may have removed you from some other position to this one, and had not the courage to fire you.

Don't, now that you are in a position where you meet the public, assume an unnatural air.

Don't try to appear to be something that you are not. By doing so you only make yourself appear ridiculous.

Don't, for the sake of being a good fellow, or for any other cause, let it be real or imaginary, allow a customer to flim flam you into doing that which you know is wrong, or not in the best interests of your employer.

Don't jump and grab the "rush" order bait, not unless you are a sucker, and are easily caught.

Don't forget that good fishermen are sometimes the most wily individuals, notwithstanding that they may appear to be sleeping on the job. In no place perhaps, was there better "fishing" than in the lumber business during the past year and many "suckers" have been bagged by the astute buyer.

Don't consider it a humiliating thing to consult the superintendent, or the foreman of the department interested, if it is possible to do so, before making rash promises concerning special, or large undertakings. Their position enables them to give you valuable advice as to what promises to make.

Don't forget that you are only a salesman, and cannot be expected to know the position at the mill at all times by intuition. Consult the mill as often as possible, if you would like to stay out of trouble.

Don't guess. Usually the man who is ready and willing to guess is not a good guesser. The fact that he would do so in business shows that his judgment is not good.

Don't introduce any cheap slang, or smart phrases into your repertoire when greeting a customer; it is often obnoxious. Undue familiarity too, has turned down more good prospects than the one responsible will ever know.

Don't countenance anything that bears the earmarks of what is commonly known as graft, or double-dealing. Show your customer that you resent even the suggestion, if made, and yet do it in such a way that if he has any manly principle he will respect you for your resentment.

Don't be contented with selling just what the customer asks for, but try to interest him in something that has accumulated that you would like to move. You cannot always accomplish this, but sometimes you can, and it helps to keep down undesirable accumulations. An ordinary clerk could sell a man what he wants, but a salesman, or sales manager should use strategy in showing his customer what he has in stock for quick shipment, and which he might be able to use as a substitute for some part of his order, and thus not only get better delivery, but also save some money on the purchase. Try this.

Don't feel peevish with the mill if you have foolishly promised a

customer something bordering on impossible, and then find that the mill cannot get you out of it in the stated time. The mill is not to blame. You ought not to have guessed.

Don't tell your customer that the mill is at fault for his order not having been shipped on time. Tell him frankly that in the largeness of your desires to please him you had not mingled judgment.

Don't allow the idea to grow upon you that the only way in which to secure business is by offering the customer inducements by way of lower prices, or by juggling with the grades. Nothing shows your weakness more clearly than this. Use your personality, if you have any, and show your customer that you are in a position to give him prompt and superior service, if you are, and mention the good points of the goods you are handling, if they have any.

Don't lie to him, nor try to pump him up with hot air. Be careful about your promises, and then when you have carefully weighed them and then made them, be just as careful to see that they are not broken.

Don't expect to keep your promises when you are dependent upon others for their fulfillment, unless you have first consulted with those others and ascertained what position they are in for performing their part.

Don't accept an order unless it has come through a sufficient number of middle-men. Let your competitor take them at first hand if he wishes, but you remember that the middle-men have to live, and you stick to your principle of doing all the good you can, to as many people as you can, in all the ways you can, and as often as you can. Never mind the profit.

Don't use up all the company's profits in telegrams in wiring car numbers forward before the car is loaded, to satisfy irate customers to whom you have made unwise promises. Such business methods bespeak frenzy.

Don't "fall" for the man who offers you flattery, but look out for him with a double watch. He may have a card up his sleeve, or fishing tackle in his pocket.

Don't be given overmuch to using the pronoun "I" when discussing the filling of an order with your customer, but rather say "we" instead. It not only sounds better, but the customer will then understand that you are not the whole organization, and as one can naturally expect more from joint effort, he will be more likely to place the order with you.

Don't overlook the fact that though you may interpret some of this as ironical criticism, yet, of a truth, yours is a very important position, and one which none other than a good man can fill. Others can occupy the position for a while, but perhaps they do not fill it. A sad commentary might be made upon the filling of this position at more than one mill in British Columbia, but has enough not been said already in these talks to show that right here, as much as, if not more than, anywhere else, is the spot where the iniquity of the fathers is visited upon the children even unto the third and fourth generation. The fathers are those higher up, and who made the blunder. The children are the men that are affected when a business is stranded.

Don'ts For Buyers

Don't place your order with the mill that stands ready to make you the best promises, just for the sake of a slight undercut in price. They will probably get it out of you in some other way.

Don't specify special lengths when you can use random lengths just as well, for the random lengths can not only be bought cheaper, but you may also get your order filled more promptly by using them.

Don't order 16-foot lengths just to help the mill out, thinking that this is the easiest length to get, for nothing was ever further from the fact, as there is always a "run" on 16-foot lengths. If you want 16-ft. stuff order so, but if you are going to cut it into other lengths, you will confer a favor and advantage upon the mill if you will give this information. The same thing applies to any other special lengths.

Don't be afraid of giving the mill too much information as to the uses to which the lumber is to be put. Such information not only gives a double assurance against mistakes, but it sometimes saves the expense of costly telegrams, and makes it possible to fill your order more promptly.

Don't mediate for weeks upon the placing of an order, hoping thereby to save some paltry sum, and then finally wire the order in, and the next day begin wiring for the car number. Orders are always better understood when written out carefully and as far as possible, in detail.

Don't be afraid to ask the mill for advice concerning anything about which you may be in doubt. It may prove to your advantage, as well as to the advantage of the mill if you will do this.

Don't place too much confidence in the mill that is willing to make you unusual promises. Promises are not always kept by some people.

Don't read the Canada Lumberman, unless you are looking for knowledge, and want to be posted along the lines of interest to lumbermen.

Don't forget the mill that has been good enough to carry you over a period of hard sledding, and then when business improves go

to the mill that offers questionable inducements. If you do you may live to regret it.

Don't depend entirely upon wiring your orders in. That is not economy. Letter postage is much cheaper when time will admit of it.

Don't be a bear and sleep all winter, and then want everything at once in the spring. Get a few cars on the road now.

Don't run away from a man if he offers to give you a carload of lumber. Keep at a safe distance though, and watch him closely while someone notifies the police. There have been some dangerous lunatics travelling the country during the past year or more.

Don'ts For The Logger

Don't open up a logging camp unless you know something about the business, and are fond of hardships and disappointments.

Don't let your men run your operations to suit themselves, unless they know more about the business than you do.

Don't let them cut the logs into promiscuous lengths without method, but see that they are measured correctly, and the proper allowance and no more is made for trimming in the mill.

Don't let them cut a log 40 feet long if 30 feet of it is clear, but see that they measure up as far as the tree is clear, and cut it there, let it be one log or two, and then do likewise in that part of the tree which properly grades as No. 2, having due regard for crooks, and so on in the top of the tree, or that part that would grade as No. 3.

Don't pay any attention to these remarks about grading the logs in the cutting, unless you want to make money, for there is money in it.

Don't say that you cannot get your men to do it. Try it, and then keep on trying, and you will find that it can be done.

Don't allow your men to measure past defects and cut the log so as to leave both ends sound, and the middle defective. That is not honest, and you will lose more than you will gain by it.

Don't allow the man who booms up your logs to put them into the boom just as they come, without regard to size, but rather see that the larger logs are placed around the outside next the boomsticks. This makes the towing proposition a safer one, and the scaler will bless you for your thoughtfulness.

Don'ts For The Architect

Don't read the Canada Lumberman. It still insists that there are some uses to which lumber should be put in preference to other materials.

Don't when working out a plan or specification, use too many of the standard sizes. It simplifies the work at the mill, reduces the waste, and enables the purchaser to save some money on his purchase, and also get his order filled more promptly.

Don't trouble yourself about the waste or inconvenience in getting out special sizes or lengths at the mill. It may be that you intend to cut them into other lengths on the job, but what is that to the mill.

Don't give out any more information for the use of the mill than you can help. The mill is filling such orders as yours all the time, and what you do not make plain to them they can guess at.

Don't forget that lumber, even at the present day is used for more different purposes than any other material known (when I speak of lumber I include all the products of the forest) and it is worthy of a great deal more attention than is being given to it. There may be a day if the world stands long enough, when lumber will be a thing of the past, but it will not be in your day, nor in mine, and this being so, there is nothing better for us to do than to study to make the best use of it possible, because, as long as there is lumber to use, it will be used. Let us hope to conserve it as much as possible, and make the supply last as long as we can, but we never can rule it out of use. Time and evolution alone can do this, and the bud has not yet begun to open which is to reveal to us, or to those who are to follow us, the real substance of the material which is intended to take the place of lumber in the plan of the Great Originator and Creator of the Universe.

The Smart-Turner Machine Company, Hamilton, Ont., have issued an attractive catalogue (No. 9) describing their power and steam pumps. The catalogue is attractively printed and contains a large number of excellent illustrations.

The New Ontario Colonization Company, Limited, whose mills are at Jacksonboro, Ont., and sales office at Buffalo, N.Y., in the New York Telephone Building have favored their business friends with a very attractive calendar decorated with a fine colored picture entitled "Where Great Pines Grow." The calendar is a very useful one, showing the quarters of the moon and giving the number of each day in relation to the other days of the year.

Any man who has worked teak on a planer will not envy those Chinese their job of working teak into furniture and mill work, because it is a wood with a native grit that dulls tools rapidly.

In Charge of Ontario Timber Lands

Chief of Great Revenue Producing Department, Responsible for Provincial Forests—Hon. W. H. Hearst

The Hon. Wm. Howard Hearst, Minister of Lands, Forests and Mines, for the province of Ontario, is in charge of one of the most important departments under any provincial government in Canada. Indeed, in point of magnitude of its responsibilities and duties, it is the equal of many of the Departments of the Government of Canada. The Department has control and direction of the exploration survey and disposition of the lands, forests and minerals in an area of 343,275 square miles, which is equal to several European kingdoms. It is not only a revenue-producing Department, but a spending Department as well, and has a staff, inside and out, actually engaged in its management, of over 200 officers, besides nearly 1,000 fire rangers and other officials on duty in the summer period when there is danger of fire. The Department is divided into two sections, Lands and Forests, and Mining, each with its deputy, and again sub-divided into branches with a chief clerk presiding over each. The sections are again sub-divided into various branches, for the effective carrying out of the vast quantity of detail work involved in such a Department.

Hon. Wm. Howard Hearst

The Lands and Forest Section

The Lands and Forests section of the Department is divided into seven branches, of which one is called the Woods and Forests branch, under the management of which comes much of the detail connected with the lumbering industry of the province of Ontario. The Woods and Forests branch is the chief revenue-producing branch of the Department. Its staff includes a chief clerk and thirteen clerks under his control. Its work includes the management of all timber sales, the issue of timber licenses, the measurement and return of timber cut on licensed and other lands, the collection of ground rent and timber dues, the settlement of disputed accounts, refunds to settlers, the checking of timber returns, the instructing and directing of forest rangers and cullers, and the direction and control of the fire-ranging staff. All accounts for timber dues are prepared in this branch, and various other matters pertaining to the management of the forest lands of the province are dealt with. The area under timber license last year was 18,410¾ square miles, and there were 643 licenses issued. The accounts open upon the books of this branch numbered 483 and the revenue collected was \$1,985,662.78. The foregoing facts are mentioned by way of preface, so as to give a fair idea of the magnitude and importance of the work carried on by the Department of which the Hon. Wm. Howard Hearst is Cabinet Minister.

The Hon. Mr. Hearst is a man of pioneer stock who was brought up on a farm in the county of Bruce and who has inherited an appreciation of the difficulties of pioneer life which has developed in him a lively sympathy for those who are compelled to wring their livelihood from the soil. His sympathies are especially active in favor of those who are engaged in clearing up a bush farm.

The Hon. W. H. Hearst was born in the township of Arran, Bruce County, on February 15th, 1864, and was educated at the Collegiate Institute, Collingwood and the University of Toronto. He is also an honor graduate in law of Osgoode Hall. He was admitted to the Bar in 1888 and is now the senior of the law firm of Hearst, Rowland and Brown. He has practiced his profession successfully at Sault Ste. Marie, Ont., for twenty-five years. Upon the formation of the Whitney Government, Mr. Hearst's ability was recognized by his appointment as government agent in connection with the guarantee loan to the Lake Superior Corporation.

Some of the Minister's Difficult Duties

In the course of his duties as a Cabinet Minister, Hon. Mr. Hearst has frequently to sit in judgment upon disputes, and although he cannot satisfy all parties in every case, those who have appeared before him realize that he is thorough in his investigations and prompt in announcing his decisions. Being a lawyer, and having had the advantage of a large practice in a lumbering and mining constituency, he is

equipped with an intimate knowledge of the affairs upon which he is so frequently called to adjudicate.

One of the most important matters coming under the Hon. Mr. Hearst's attention is the protection of the forests from fire. In this direction he has achieved practical results by increasing the number of fire rangers. Matters of conservation and reforestation have also occupied his attention, and so much impressed has he been with their importance that, at his suggestion, an expert forester has been employed to study these questions with a view to protecting and prolonging the life of the forest wealth of Ontario.

A delicate duty falls upon the Hon. Mr. Hearst in holding the balance between the interests of settlers and lumbermen. There are many occasions when these interests are found to clash and it is the duty of the Minister to harmonize them as much as possible. Hon. Mr. Hearst has improved the position of the settler in respect of his rights to timber and minerals on his land. Under his inspiration the legislation affecting mines and timber has been made more favorable to the settler than it was before he entered office.

Developing the North Country

Securing industries for the north country, so as to provide employment and a market for whatever the settler could raise, as well as the timber he has to sell, has been one of the Hon. Mr. Hearst's important duties. Lumbermen have been much interested in an effort made along these lines, which is resulting in an important development under the management of the firm of Jackson and Tindle, near Cochrane. Another development of great importance to the north country, which has been worked out under the Hon. Mr. Hearst's direction is that which involves the erection of large pulp mills at Abitibi. These two undertakings will furnish important markets, both for the settlers' products and for their labor.

The Hon. Mr. Hearst is in the prime of life, being under fifty years of age, and is able to devote to the management of his Department all the enthusiasm and vigor of a young man with his heart in his work.

An important announcement in connection with the government's forest protection policy, was recently made by Hon. Mr. Hearst at the banquet held by the Canadian Lumbermen's Association at Ottawa. In an excellent speech upon the forest resources of the province, Mr. Hearst spoke of the great importance of a first-class fire ranging service. He also stated that during recent years much had been done to improve the fire protection service of the province by the construction in some of the reserves of telephone lines and lookout towers, and by providing gasoline boats, speeders, etc., where these could be used to advantage, and in other ways; and that it was the intention of the Department to continue to improve the service by extending these and other improvements to all the reserves where it was practicable and advantageous so to do, and generally by perfecting the service as much as possible so far as the money available for this purpose would permit.

Robert McNair Co. Erecting Shingle Mill at Port Moody

A start has been made on the erection of the shingle mill at Port Moody, B.C., which is to be established by the Robert McNair Shingle Company, near the head of Burrard Inlet. The plant will be considerably larger than the one operated by the same concern in Hastings. Twelve machines, capable of turning out 350,000 shingles a day, will form the equipment at the new mill. The company will use the railroad built by the B. C. Electric Railway to the Coquitlam Lake dam in connection with its power development scheme, having leased the line for a period of 25 years. The timber berths owned by the McNair interests are five miles from the site of the new plant near the head of the Inlet. Logging will be started as soon as the weather conditions become favorable. Between 60 and 100 men will be employed at the camp and about 45 at the mill. Mr. J. R. Crockett, who was for many years in charge of logging operations for a large California concern, has been appointed superintendent, and is making arrangements for getting out a large supply of cedar bolts. Sawing is expected to be commenced in the latter part of May or early in June. The building will probably be completed early in April, and it is thought that the plant will be installed and ready for operation a few weeks later. The output of the new plant is estimated to run from 20,000,000 to 30,000,000 shingles a year. Trackage facilities will be installed and the mill connected by spurs with the main railway.

The British Columbia Government has been asked to send an exhibit of forest resources to the Forest Products Exposition at Chicago in April. It is believed the invitation will be accepted in view of the fact that the new tariff has given opportunities for selling the lumber product of this province in the United States, especially in competition with yellow pine.

Sudbury Company's Splendid New Plant

Modern Equipment and Fine Buildings of the Laberge Lumber Company, Ltd.
—Rebuilt in Three Months After Fire last April.

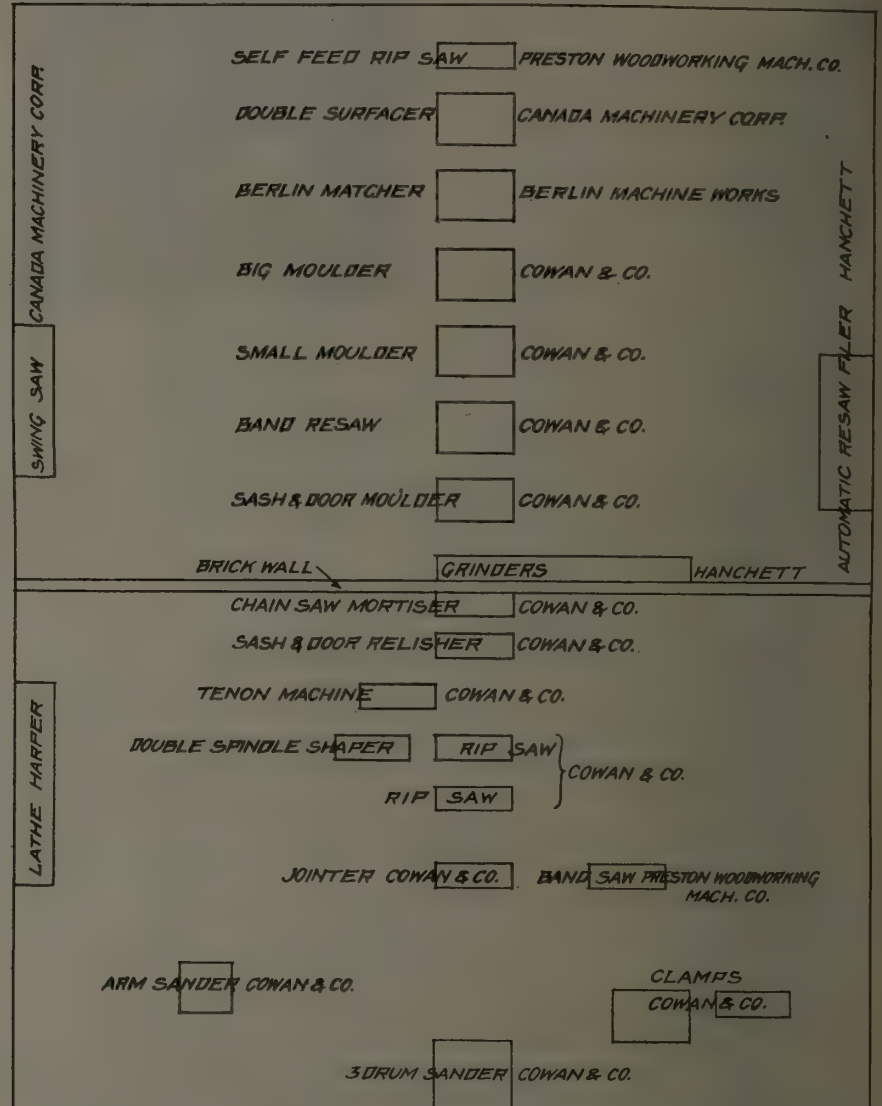

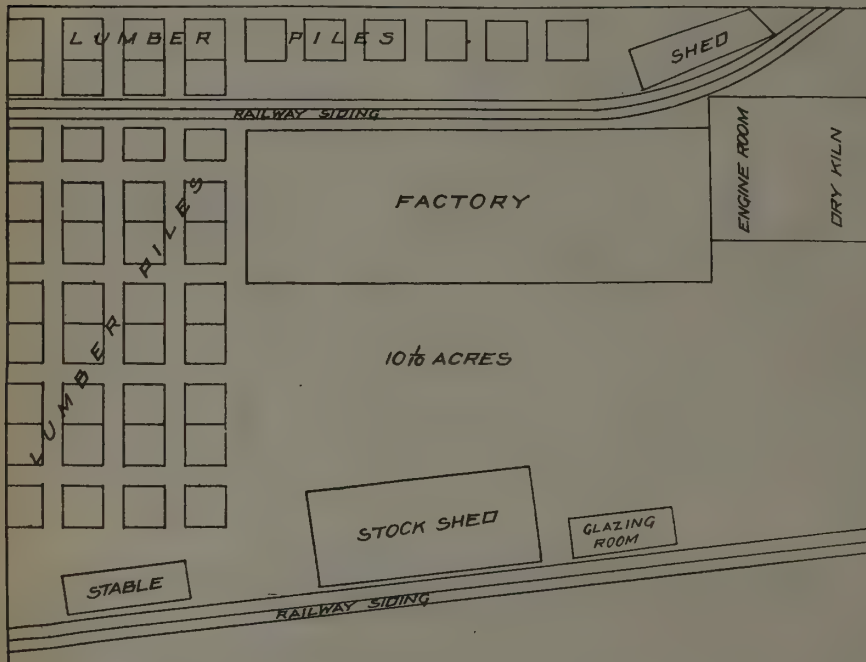

Lumber travellers who visit Sudbury, Ont., will immediately recognize the accompanying illustrations, which represent the interesting new plant of the Laberge Lumber Company, Limited, and a portrait of the president, Mr. J. B. Laberge. The illustrations tell their story so thoroughly that there is little need to go into detail in the form of a description. The following facts, however, will be of interest and will give those who may not be acquainted with this company some idea of its progressiveness and extent.

The plant occupies a splendid site covering ten and one-tenth acres along the new transfer tracks of the Canadian Northern Railway and abutting Notre Dame Ave. The buildings have been constructed in a most substantial manner. They consist of a solid brick factory, 90 x 144 ft., an engine room 48 x 66 ft., and a shavings vault, 16 x 66 ft., the latter building being constructed entirely of cement. In planning the buildings the company had in view, more almost than any other feature, the importance of using fireproof materials. All the buildings are roofed with fireproof roofing, and hydrants and standpipes have been installed at a number of places for fire protection.

Equipment of the Plant

To the visiting lumberman, the most interesting part of the plant is its excellent layout and equipment. The machinery includes one

band resaw, one self-feed rip saw, one double surfacer, one Berlin high speed matcher, one large moulder, one small moulder, one sash and door moulder, one swing cut-off saw, four automatic grinders, one Hanchett resaw filer, one chain mortiser, one sash and door relisher, one tennon machine, one double spindle shaper, two rip saws, one dado machine, one lathe, one band saw, one three-drum

J. B. Laberge, Sudbury, Ont.

sander and one arm sander. The layout of these machines has been studied with a special view to efficient working. Their location will be seen from the accompanying illustration.

The power for the plants is obtained from 150 h.p. engine and boilers. The buildings are lighted by electricity throughout, and heated by a hot-air fan-circulated system. All shavings are carried by fan to a solid cement shavings vault.

The erection of this plant occupied exactly three months, the first sod having been turned on April 1, 1913, and the plant having been in operation on July 2. Since that date the plant has not had an idle moment and has been running to its fullest capacity. On the average, 45 men are employed, and the annual wage list approximates \$50,000.

In the north country, the Laberge Lumber Company have worked up an excellent business. Their connection extends to Sault Ste. Marie and Chapleau on the west and touches practically every intervening point. The North Bay district and the Porcupine country are already large customers, and as quickly as the new Canadian Northern is being constructed to Port Arthur, shipments are being made to points along that line.

In addition to the manufacturing business above outlined, the company conduct a large wholesale department and a contracting department which have been doing splendid business throughout New Ontario for some time.

Officers of the Company

The president of the company, Mr. J. B. Laberge, was formerly superintendent of the Mond Nickel Company at Victoria Mines. He occupied this position for four years, devoting his attention to the building, sawmill and lumber departments. Then he took a position as superintendent for the Canadian Copper Company, having charge of their building and lumber departments for another period of four years. In 1900 Mr. Laberge started business for himself as a contractor and in 1902 added a lumber yard and a complete line of building supplies.

The secretary-treasurer of the company, Mr. J. A. Laberge, is a son of the president and started in business with him in 1902, since when he has been continually employed in this manner. Mr. J. A. Laberge is a graduate of Rigaud College.

Mr. H. Aurie, factory superintendent, was formerly in the employ of the Sudbury Supply Company for a period of seven years, after which he was three years in the position of factory superintendent for the Empire Lumber Company.

Fraser & Co. Will Move Deschenes Mill

Fraser & Company, Ottawa, Ont., are contemplating the removal of their Deschenes mill to Grand Lake Victoria, in the province of Quebec, near the head waters of the Ottawa, Lievre and Gatineau rivers. The removal, however, will not take place until the North Railway is built. The North Railway Company has a charter to build a line between Montreal and a point on the Grand Trunk Pacific. This line will touch both Grand and Rabbit lakes. Fraser & Company may locate their mill at the latter place. At present, however, they have surveyed a mill site at Grand Lake, which has been approved by the Quebec Government. If the North Railway Company does not proceed, Fraser & Company hope to persuade the Grand Trunk Pacific to build a branch into Rabbit lake. Failing this, the limit holders of the district have a charter to build a branch to either Grand or Rabbit lake. The North Railway Company, however, are pretty confident that they will commence construction during the coming spring. Fraser & Company are forming a milling company to take over their mill and have succeeded in interesting the other large limit holders of the district. The company will be in a position to saw for each firm interested, or to buy logs or standing timber from the shareholders of the milling company. The shareholders will include representatives of the holders of upwards of 800 million feet of pine and a considerable quantity of spruce. The quality of the timber will be particularly good, being a virgin cut. The manufactured lumber will be disposed of in the same markets as Ottawa lumber.

Fraser & Company's mill is practically a duplicate of the St. Anthony Lumber Company's mill at Whitney, Ont. It has engine and boiler capacity to cut about 170 thousand feet B.M., per day, on a daylight run, and was built in such a manner as to facilitate removal when necessary. Fraser & Company expect to cut out, during 1914, most of their present stock of logs in the Ottawa river and will then cease operations on their limits on the main Ottawa, Coulouge and the Black rivers, covering an area of about 500 square miles. They will probably dispose of these holdings from time to time, to Ottawa river mills. In fact, they are now negotiating for the sale of a block of 170 square miles.

Mr. J. H. Acer, secretary of the Laurentide Company, Limited, has been admitted a member of the Montreal Board of Trade.

The Chief Sources of Logging Waste

Editor Canada Lumberman:

New York, Jan. 14th.

I am interested in a letter from the Hon. W. C. Edwards which appeared in your issue of January 1st, in which he states that he can think of but two real sources of waste in lumbering operations. I think of more than two. I have been actively connected with the elimination of more than two sources of waste in the spruce woods of the north and in the pine of the south, in pulpwood operations and in saw log operations. On one operation in North Carolina, I found that by increasing the used length of the tree by two feet the production in board feet could be increased by 4 per cent., without appreciable additional labor, or cost, or decrease in quality. The stumps averaged nearly a foot higher than necessary and the log length could be increased in the top on an average of over one foot per tree. The company operating acted immediately on my report and took action to eliminate this waste.

In the north, I have found the following sources of waste of sufficient importance for the companies interested to spend thousands of dollars in their elimination. The first and third are Senator Edward's.

1. Cutting logs in arbitrary lengths without consideration of quality.
2. Stumps cut higher than necessary.
3. Taking out crooked, limby and otherwise defective logs at a loss.
4. Large tops left in the woods.
5. The use of valuable logs in camp construction, for temporary bridges, skids, etc., when less valuable material was available.
6. Building skidways on soft ground so that bed pieces of value were pressed into and frozen into the ground and left.
7. The use of the axe where the saw could be used.
8. Large mature trees left standing which would rot before a second cut could be made.
9. Lodged trees left.
10. Logs cut up by swamper so as to be of unmerchantable size.

This is only a partial list, but by the elimination of these factors, I have seen the waste in a logging operation reduced from over 15 per cent. to less than 1 per cent.—D. E. Lauderburn.

Good Retail Outlook at Jarvis, Ont.

Editor Canada Lumberman:

Jarvis, Ont., February 16

The retail lumber trade in Haldimand and Norfolk during 1913 was good, particularly the custom trade and the trade in the rural districts. The farmers as a rule are prosperous and the old farm buildings of the early settlers now require renewal and up-keep which make good trade for the retail lumbermen. My business during 1913 was one-third greater than during 1912. Farmers had a fine crop in 1913 and I am looking forward to a prosperous trade in 1914. In retail districts a good crop furnishes a great stimulus and induces the farmers to improve their properties.

The only drawback to the retail trade today is the credit system which is still adhered to. This is a great handicap to the retailer, unless he has capital enough to meet the demands of the manufacturer who wants his money in fifteen or thirty days. The farmers who have grown up in Canada cannot understand the present prices of lumber. Their fathers burned better lumber than that for which they are now paying \$35 per thousand. Another drawback to the trade in lumber is the increasing use of cement. Where I sold two cars of cement five years ago, I am now selling from ten to twelve cars. Most of this takes the place of lumber. However, I am looking forward to an active trade during the coming summer. United States lumber stocks are coming into Canadian markets extensively and are competing seriously in price with the Canadian product.—J. C. Sanderson.

Cooperage Outlook Encouraging

Editor Canada Lumberman

Chatham, Ont., Feb. 17th.

The only change in the cooperage market, at the present time, is that of the apple-barrel. Coopers are now beginning to place orders for stock, so as to get a start early in the spring, making barrels. The orchards throughout the western part of Ontario, are loaded with fruit buds. We have no report on the eastern part yet, except in one or two instances, and reports from these points are also very satisfactory. If nothing untoward happens, between now and the "setting" season, for the fruit, the crop will be above the average, but there is "many a slip 'twixt the cup and the lip."

What little winter we have had so far this year, has been this month. When we speak of "winter," we mean good sleighing. At our northern and eastern mills, we have had good sleighing, but very little sleighing around our western Ontario mills. From present indications, however, we expect to have better average stocks than last winter, although the timber is costing more.—The Sutherland, Innes Company, Limited.

New Plant of McAuliffe Davis Company

Chamberlain Ave. Factory Rebuilt After Fire—Now Equipped with Latest Machinery—Fireproof and Thoroughly Efficient.

The woodworking plant of the McAuliffe Davis Lumber Company, Limited, on Chamberlain Avenue, Ottawa, which was destroyed by fire, together with all the contents in machinery and stock on March 8th, 1913, has been replaced by one of the most interesting and complete planing mill plants in Canada. The accompanying illustrations show the layout of the machinery and yards. The loss by fire was a severe blow to the company, on account of the fact that it occurred at the opening of a very busy season. The difficulties involved were considerably lessened by the fact that the company have other mills which enabled them to carry on their work without any interruption and to commence at once upon the work of rebuilding. In the city of Ottawa, the McAuliffe Davis Lumber Company operate five yards known as "A, B, C, D, and E."

The cost of the new buildings at yard "B" on Chamberlain Avenue, which include planing mill and factory building, was \$30,000. The machinery cost \$25,000. The building has been constructed particularly with a view to the prevention of fire, being of slow-burning mill construction, with cement floor and solid four-brick wall, the upper floor being composed of 2 x 6 on edge.

The power is developed by two boilers operating a Corliss engine of 150 h.p. The boiler room is of solid cement. For fuel the company use shavings and sawdust fed to the boilers automatically through a Sheldon blower system.

Layout of the Machinery

As will be seen from the accompanying illustrations, the heavy machinery is located on the main floor, only the lighter factory machines being placed upstairs. The machinery was purchased from and supplied by the Berlin Machine Works, the American Wood Working Machinery Company and the A. R. Williams Machinery Company. The new factory building is 120 feet by 90 feet and two storeys high.

Approximately ten million feet of lumber will be handled at this plant annually, and about two-thirds of this will be machined. This building is also equipped with a special showroom for the higher class of material, including sample doors, mouldings, newel-posts, etc. The equipment also includes a glazing department, protected from fire by solid walls and fire doors.

The new plant on Chamberlain Avenue was completed on October 1st and has been running at full capacity ever since that date.

Railroad sidings adjoin the property and cars are unloaded without rehandling, by use of rollers. Hardwood flooring is stored in heated warerooms to insure a satisfactory condition, when leaving the plant.

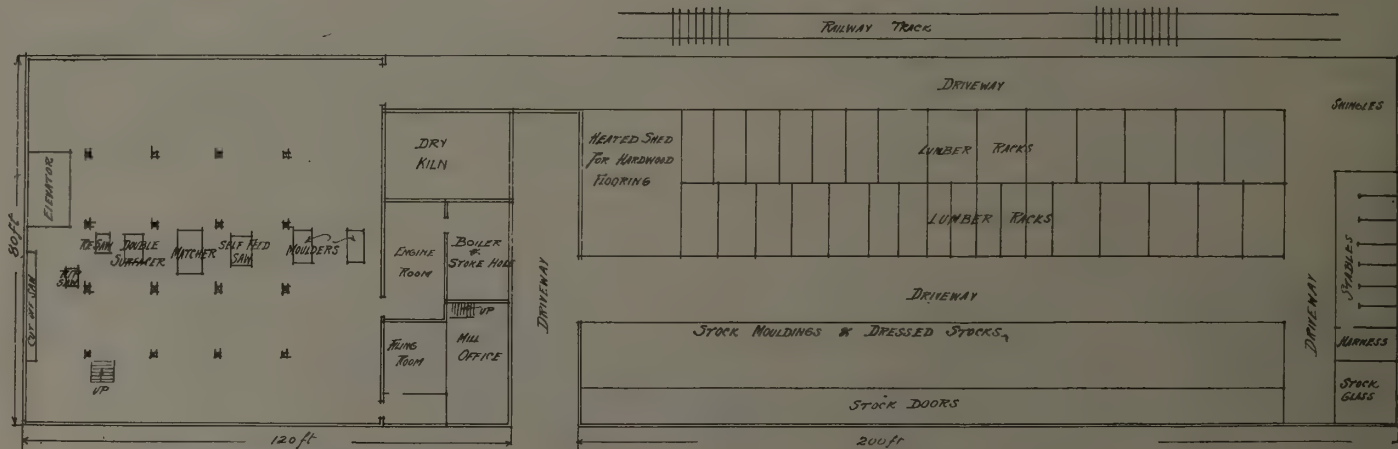

Equipment at Yard A

At yard "A" the company also operate a planing mill and have a lumber storage yard. This yard is divided into two or three units with space between, so that, in case of fire, only one unit is likely to be destroyed. The planing mill building which is connected with the dressed lumber shed, is constructed of solid brick walls and has wood and gravel roof. The machinery at this plant is located in one corner of the building and protected from the dressed lumber by interior walls of brick. The entire building covers a ground space of 99 ft. x 200 ft. The company are considering plans for important improvements at this yard and will probably purchase new machinery for this planing mill and equip it in much the same manner as the plant at unit "B."

About 150 ft. from the mill at yard "A," the company have erected, on the corner of Duke and McAuliffe Streets, their head office building. Adjoining this is located their warehouse containing a stock of materials, such as doors, mouldings, roofing, Beaver board, etc., in which they carry on quite an extensive wholesale trade. This building covers a space of approximately 66 ft. x 99 ft.

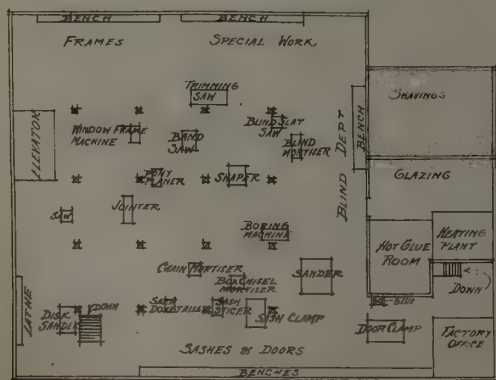

The McAuliffe Davis Lumber Company, Limited, also operate a planing mill at one of their other yards. At the fourth yard there are only rip saws, which are used for sizing lumber sold from that point. The fifth yard is used as storage for lumber which has been run through one of the company's other planing mills.

The British Columbia coast timber cut for 1913 exceeded that for 1912, according to a statement made recently by Mr. D. G. McKay, the Government timber inspector. Although the activity in the mills has not been as great as during last year there have been more actual logging operations. Forty-eight miles of horse trail were finished last Fall in the Campbell River and Salmon River Valleys, Vancouver Island. Telephone communication will be established by the Government in the early spring. The cable for the telephone from Heriot Bay to Shoal Bay has been ordered, and will be laid early next month. The Government intends to extend the telephone communication next year farther north.

The Electric Tractor in Sawmill Service

How a Large Southern Manufacturing Company Solved One of Its Problems and Reduced Operating Costs by Using Electric Mules

Electric Tractor in Saw-Mill Service—on the tramways

Electric Tractor in Saw-Mill Service—Side view of Tractor

Every manufacturer of lumber and many owners of large retail yards are keenly interested in the problems connected with the transfer of stocks from a mill to the yard or from one part of a plant to another. A great deal of the cost of the production of lumber is the result of transfer expenditures and any plan which will either reduce these costs or make transfer operations more efficient is of great importance. For this reason, the accompanying illustrations will be interesting to many of our readers. They show how problems of this class have been solved in connection with a large lumber manufacturing plant in the Southern States. The Industrial Lumber Company operate a sawmill with a daily capacity of 300,000 feet at Elizabeth, La. The company have always adopted the most modern ideas in connection with their operations. To illustrate this we may mention that they utilize six large freight engines and 75 flat cars in moving their logs from the forest to the mill. The plant employs about 1,000 hands, nearly 50 per cent. of whom are negroes. Throughout all their operations "efficiency" is their watchword, from the felling of the trees to the moving of the lumber in the yards by their new electric "mules." Even the bark and strippings from the sides of logs, which in most mills are carried to one end of the yard and burned, are, at this mill run through a "hog" (a large electrically driven, high-speed cutter) which shreds the material, which is then conveyed to turpentine boilers or vats where the turpentine is extracted from the wood by a process of steaming. This is mentioned merely by way of indicating what we mean by stating that "efficiency" is the company's watchword.

The trees, after being sawn down are cut in half and pulled from the forest to the side of the track by a large steam derrick which can pull four logs from four different directions at the same time. From the side of the track the logs are loaded on the freight cars by a mechanical loader which travels on the standard gauge track. The train of loaded cars is then run back to the mill, where the logs roll by gravity into the mill pond. From here they are carried to the mill by

an endless chain. About 25 per cent. of the output goes to the timber docks where it is shaped abroad, or to American users requiring heavy timbers. The dry kilns take about 15 per cent. of the output. One of the accompanying illustrations shows lumber from the kiln being towed to the storage sheds at the other end of the yard. The balance of the lumber is piled on the stacks and put through the planer. The moving of this lumber formerly required about 20 mules and a corresponding number of men. This was an expensive operation and the company set itself to consider how to reduce the cost. The result was that an electric tractor was built for the work.

The General Vehicle Company Inc., Long Island, N.Y., were entrusted with the production of the electric tractor. Although it was not exactly a new proposition to them, it was the first time to their knowledge that an electric tractor had been adapted to operating conditions of this kind. The general specifications called for something which would handle quickly from 2 to 4 tons of lumber, something which would load and unload very quickly, and yet be simple in operation and inexpensive to operate, at least from the standpoint of labor. Freedom from fire risk was also a consideration. The requirements were met by building a tractor of the following specifications:

Chassis rating . .	Two-ton.
Battery	44-17-G. V. Lead.
Motor	G. E. 1026—85 V.
Controller	S-35.
Wheelbase	54 inches.
Frame	4-inch rolled steel channel.
Wheels	Artillery type on Timken.
Tires	Front, 28 x 4 in.; rear, 28 x 3½ in., dual.
Countershaft . . .	Housed type on Timken.
Brakes	Internal expansion on rear wheels.
Springs	Half elliptic, front and rear.

As will be noted from the illustration, the battery is mounted on the top of the chassis, the driver's seat is at the rear of the battery.

Electric Tractor in Saw-Mill Service—Towing to Storage Sheds

the controller is at the driver's left hand, while the brake lever is operated by his right foot and the bell by his left foot. The cradle is supported by a steel extension from the chassis frame and rests on a substantial revolving block held to the supporting members by a king bolt which passes through.

The lumber is first loaded on the standard two-wheel lumber dolly and is connected to the tractor by backing the tractor under the load, a chain being thrown around the lumber back of the first crossbar on the dolly and in turn attached to the end of a cable which passes through a guide bolt near the king pin and around the drum of a standard Sprague hoist. The driver presses a lever on his left and the hoist operates the cable, which tightens the lumber to the dolly and holds it securely to the rear bolster.

In moving lumber from the mill to the lumber stacks the tractor has a capacity of 7½ round trips (2,400 feet each) per hour, towing an average of 1,500 feet of lumber, or 3,375 tons. In this work one tractor replaces five mules and three men.

This big mill has about 5 miles of tramways, running from the mill to all parts of the different yards. Tramways are from 16 feet to 20 feet wide and are floored with 3-inch timber. At the mill the tramways are about 20 feet from the ground, sloping to about 4 feet at the opposite end of the yard. The tramway lumber is worth \$13 per thousand board feet and costs \$5 per hundred for laying. These figures are important, as the mules' shoes necessitated the renewal of this lumber every three years at a cost of \$25,650. Obviously rubber tires will show a big saving in this item alone.

After the lumber is dried, it is moved from the lumber stacks and dry sheds to the planing machines and then loaded into freight cars, located from 60 to 1,000 feet away, either by hand or by the tractor. This work is considered very hard on the mules and difficult for the truck, as the hauls are very short and the roads tortuous. The truck has to go between the planers and in other narrow places and into the drying sheds, where it is necessary, sometimes, to back down a long narrow aisle. It is in this class of work that the tractor shows the largest saving, due to its flexibility of operation in the smaller spaces and the ability to load and unload quickly. In such work one tractor displaces 7 mules and 5 men, making 13 round trips per hour, with 1,100 feet of lumber per trip. The average distance covered per round trip is 2,000 feet. In transferring lumber from the dry kiln to the dry sheds, one tractor will do in two hours work that usually takes two mules all day to do.

Tractors vs. Mules—Cost of Operation

Three tractors and six men take the place of sixteen mules and twenty men, and the expense works out as follows:

INVESTMENT.		Mules	Tractors
16 mules at \$2.25 each	...	\$ 3,600	
20 sets harness at \$25 each	...	500	
20 2-wheel dollies, with shafts, at \$25 each	...	500	
3 electric tractors with (G. V.) batteries at \$2,900 each	...		\$ 8,700
Stable, grain, horse, blacksmith shop, etc.	...	3,000	
Garage, charging apparatus, etc.	...		1,000
Total	...	\$ 7,600	\$ 9,700
FIXED CHARGES		Mules	Tractors
Interest	...	\$ 228	\$ 291
Depreciation	...	1,140	1,020
Fire insurance	...	100	87
Total fixed charges per year	...	\$ 1,468	\$ 1,398
OPERATING COSTS		Mules	Tractors
Renewals of batteries (every year)	...		\$ 867
Renewals of tires (every year)	...		600
Renewals of chains, gears, etc.	...		375
Feed, shoeing, stable help, etc., at \$20 per month per mule (16 mules)	...	\$ 3,840	
Labor	...	10,500	3,600
Repairs to tramways	...	8,550	4,275
Total operating costs per year	...	\$22,890	\$ 9,717
Total costs per year	...	\$24,358	\$11,115
Saving per year by using electric tractors	...		\$13,243

No current has been figured in the operating costs of the three tractors, as the amount used is not considered of any consequence. Assuming that a mill were to buy current from the central station at 4c per kw.h., the cost would not average over \$200 per tractor, or \$600 in all.

Operating costs of tractors are given with G. V. conservatism, as the figures include battery, tire, gear and chain renewals each year. The load is towed, not carried, and this should favor tires and other parts which show rapid depreciation in heavy haulage.

Three Fine Elm Logs

The accompanying illustrations represent an interesting load of elm and basswood logs taken out by the Fassett Lumber Company, Fassett, P.Q. These logs were taken out before the fire, which destroyed the company's former plant and the exact figures relating to

A Fine Load of Elm and Basswood Logs—Fassett Lumber Co.

them were destroyed in the fire. The company advise us, however, that according to recollection, the three elm logs shown in the illustration produced a total of 3,930 feet, 22 per cent. of which was No. 2 and No. 3 common, the balance No. 1 common and better. Of this

Elm Lumber Produced from Three of Above Logs by Fassett Lumber Co

total, 1,400 feet was sawed into 2-inch No. 1 common and better. The top end of the smallest of the elm logs measured 42 inches in diameter, and the top end of the butt log measured 54 inches in diameter.

Exports of forest products from Canada were smaller in 1913 than during the preceding year, although slightly larger than in 1911. Total exports of forest products in 1913 were valued at \$42,875,089; in 1912, \$48,112,393 and in 1911, \$40,654,422.

The Canadian Northern Railway has taken a progressive step in connection with the prevention of fire along its lines by the appointment of Mr. William Kilby as Fire Inspector. Mr. Kilby is to have general charge of all phases of the company's fire protection work. This practically involves the creation of a new department in the company's organization. This includes right-of-way clearing, fire patrols through timbered country, and the construction of fire guards through prairie sections in Alberta, Saskatchewan and Manitoba. The prosecution of these lines of work is required by the Railway Act and the orders of the Board of Railway Commissioners. The Canadian Northern is the first large railway company to organize a special department to handle fire protection work.

The Health of Ontario Lumber Camps

Provisions and Working of the Provincial Public Health Act—How the Lumber Jack is Protected

By John W. S. McCullough, M. D.

The sanitary conditions of the lumber camps in Ontario are of special interest, the operations being carried on mostly in unorganized districts extending from the Ottawa River in the east to the western boundary of the province, covering a territory of about 1,200 miles long by 200 or 300 miles wide.

In this territory there are each season from 500 to 600 camps with from 20 to 30 to 100 men each—in all, between 20,000 and 30,000 men. A large proportion of these employees, especially along the north shore of Lake Huron, come from the Province of Quebec, while farther west, many of them are men from the Maritime Provinces, and stay over for the winter on their return from the harvest fields of the Northwest. These men, being far from home and the conveniences of the settled portions of the country, must be supplied, at least, with the necessities of life, by their employers, and among these, medical or surgical aid in case of illness or accident.

In order that illness may be lessened as much as possible, regulations under the Public Health Act are provided. These regulations have been in existence for many years and have been amended from time to time, as found necessary, until now, under the recently revised Act they are very complete.

The enforcement of the regulations comes under the duties of the owner, manager, agent or foreman of the camp, but has been largely attended to by the efficient medical and sanitary inspectors of the Provincial Board of Health. For several years the work has been done by Dr. R. W. Bell, Provincial Medical Inspector, and Mr. George E. Young, Provincial Sanitary Inspector; but since the appointment of District Officers of Health, under the new Act, these officers in the territories mentioned will aid greatly in the work.

On the establishment of a camp, the owner is required to notify the Provincial Board of Health of its location, name of foreman, means of access to camp, average number of men in it, name and residence of physician contracted with and whether he is located in camp or not, date of contract and duration, also copy of contract, and whether a permanent or tent hospital is provided.

The Contract Physician's Duties

The contract physician is required to take sanitary supervision of the camps and make at least a monthly inspection, reporting to the Provincial Board of Health, furnishing with his first report a pen or pencil sketch of the camp, showing the location of the camp buildings, distance apart, location of water supply, slopes of ground with drainage, etc. The contract may only be for sanitary supervision and, if so, is paid for by the owner, who is, however, liable for any expense incurred by any employee for maintenance and medical attendance necessary on account of any illness developing in or traceable to his residence in the camp. However, that all the expense may not be shouldered by the firm or owner, provision is made that the contract may also provide for attendance and medicine, etc., and in this case an amount not to exceed one dollar (\$1.00) per month can be legally retained from each man's wages to be paid to the physician "without deduction," the camp owner providing hospital accommodation and maintenance.

This latter form of contract is most usual. In most cases 50 cents per month is the deduction, especially in the eastern section of the province, while farther west in the Fort William district 75 cents, and in the Lake of the Woods district \$1.00 per month is deducted. In the latter cases the physicians usually provide hospital accommodation. Communicable diseases must, however, not be taken out of the camp, and must be isolated in camp hospitals, and the same measures adopted to stamp them out as provided for by health authorities in organized municipalities. Every employee shall, when requested, furnish the officer of the Provincial Board of Health with a certificate of successful vaccination within the preceding seven years, and the camp may be quarantined until such certificate is furnished.

Location of Camps

No camp shall be erected nearer than 100 feet to any lake, stream or other water, and the regulations provide for the proper construction and sanitary conditions of buildings, lavatories and closets, etc. Bunk houses shall contain 600 cubic feet of air space for each occupant, and bunks run parallel with the wall to prevent overcrowding, the lower ones being raised about a foot above the floor. Pole floors have been abolished and board or plank substituted and are usually scrubbed once or twice weekly, a disinfectant being used.

Adequate lighting and ventilation are required, to the satisfaction of the inspector.

A separate kitchen with dining room must be provided with proper conveniences for cleanliness and disposal of garbage at a safe distance (so deposited as not to create a nuisance nor to contaminate the drinking water).

A separate building for wash-house or laundry is required and with it proper facilities for bathing. Stables shall not be within 125 feet of the kitchen, and farther if necessary in large camps. Latrines and closets shall be located to the satisfaction of the inspector and maintained in a sanitary condition.

The necessity for these sanitary precautions is frequently ridiculed by some older lumbermen, but is easily understood when we find that many camps start operations in September, or even in August, in warm weather, while in former years work did not begin until snow was on the ground and everything was frozen up. In earlier days the employees were mostly farmers or farmers' sons from nearby settlements, and not many communicable diseases were brought in, but, with the present facilities for travel, a large majority come long distances and from cities where these are prevalent and greater precautions have therefore to be taken. On the first appearance of any of these diseases, the Provincial Inspectors at once step into the breach and see that every precaution is taken to prevent any further spread.

Nearly all employers are awake to the necessity, in their own interests, of preventing illness amongst their men, and in few instances have the penalties of the Act to be enforced. As a result of their co-operation with the officers of the Provincial Board of Health, the comfort and the health of the employees has been very much improved in recent years.

Veneers Increasing in Favor

At the recent annual meeting of the National Veneer and Panel Manufacturers' Association, the president, Mr. C. T. Jarrell, in his address, said there was no question that the use of veneers and built-up panels was greater to-day than ever before and that new avenues were constantly being opened up for their use. The idea that veneers and goods manufactured of veneers are inferior had been superseded by the knowledge that for quality, beauty and utility, products of the veneer mills must be used. Prejudice against certain woods that had formerly been considered practically worthless had almost entirely disappeared, and buyers as a rule were willing to pay fair prices for satisfactory stock and were suspicious when abnormally low prices were quoted.

Liverpool and Manchester Stocks

H. W. Lightburne & Company, Liverpool, Eng., furnish the following report upon Liverpool and Manchester stocks on February 1st:

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 20th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

Wanted

500,000 feet 1-in., 1½-in. Soft Elm.
700,000 feet 1-in. Basswood, Ash and Birch.
For delivery as soon as dry this year. State what you can supply and lowest prices on cars.
Box 945, Canada Lumberman, Toronto. 3-8

Wanted

Several cuts of good Maple and Beech to be sawed during Winter and Spring of 1914 in District between Georgian Bay and Toronto, also stocks of Birch from Muskoka District. Box 964, Canada Lumberman, Toronto. 4-7

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

Wanted to Buy

500,000 ft. log run, sawn Hard Maple, various thicknesses, M. C. out. Must grade proper percentage 1S and 2S and No. 1 Common and not to exceed 20 per cent. No. 2. Will pay cash when loaded on cars; or will buy good Maple logs in the round, 12-in. and up diameter.

Write P. O. Box No. 1595, Montreal, giving best price and rate of freight to Montreal. 2-tf.

Wanted to Buy

4/4 White Basswood,
4/4 12-in. and over wide Soft Elm.
Round Rock Elm Logs 12-in. and up diameter, 20 to 35 ft. long—admit 10 per cent. good white gray elm. Any station in Canada. Also square Rock Elm timber.
Highest prices. Spot cash.

HALL BROS.,
Manufacturers and Wholesalers.
Toronto and Marmora. 4-7

Hardwood Pickets Wanted

Beech, Birch and Hard Maple.

1 x 1 x 42.
1 x 1 x 48.
1 x 1½ x 42.
1 x 1½ x 48.
1 x 1¼ x 42.
1 x 1¼ x 48.

Require Thickness, 1/16-in. Plump.

Quality—Free from all defects.

Can take delivery of green or dry stock.

Apply to The Canada Wood Specialty Co., Ltd., Orillia, for full particulars, price, etc. 24-1-TF

WANTED FOR FACTORY USE

1-in. Black Ash Lumber, No. 2 C. & B., and also take the Culls; also 1-in. Basswood. State whether the stock is dry, well manufactured, and the point where it would be loaded on the cars. Immediate shipping instructions given. Apply immediately to Box 967, Canada Lumberman, Toronto. 5

Wanted to Buy

We want to buy 10 C/L Hemlock hds., clipped lengths; also merchantable spruce, 2 x 3, 4, 6, 8, 9, 10 and 12 in., 1 x 2, 1 x 3, and several Spruce frames. Cash business. We will contract with small mill with planer and matcher for entire output.

IMPERIAL LUMBER COMPANY.
Boston, Mass., U.S.A. 5

For Sale-Lumber

Red Pine For Sale

Four carloads 2 x 4 and up; 18 ft. to 24 ft. P. O. Box 392, Ottawa, Ont. 3-tf.

For Sale

60,000 ft. 5/8 in. x 4 and up Common and Dressing Spruce.

Close prices for prompt shipment.

The Elgie & Jarvis Lumber Co., Ltd.,
Toronto, Ont. 5

For Sale

Cut of Hemlock near Ottawa. Will manufacture to suit buyer.

HALL BROS.,
Manufacturers and Wholesale Lumber Merchants
Marmora and Toronto. 4-7

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.

375 Pieces 1 x 15 and up 24 ft. Cypress.

Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
Montreal, Que. c

Lath

We have a quantity of hemlock and pine lath ready for immediate shipment.

The Fletcher Pulp & Lumber Co., Ltd.,
Sherbrooke, Que. 5

\$15,000,000.00

We have about fifteen million dollars worth of timber lands for sale. Write us what you want. Dealers in timber lands, lumber yards, mill machinery, mills for sale, arranging loans, selling and exchanging cut-over lands, and a general real-estate business. If you want to buy or sell write us.

THE JANESVILLE EXCHANGE,
Timber Department,
Janesville, Wisconsin. 1-tf.

Cedar Poles

Quantity of 25 ft. to 36 ft. Peeled Poles, ready for immediate shipment, F.O.B. cars, G. T. R., Sherbrooke, Que.

The Fletcher Pulp & Lumber Co., Ltd.,
Sherbrooke, Que. 5

Wanted-Machinery

Wanted

Half-inch boom chain. Schroeder Mills and Timber Company, Salines, Ont. 4-5

For Sale-Machinery

A Bargain

44-inch Wick Gang for sale at a bargain. In first class shape. Apply,
Fraser Lumber Company, Ltd.,

Plaster Rock, N.B. 2-7

For Sale

Thirty Standard Gauge Flat Cars in good condition; will pass M. C. B. inspection; 30 ton capacity, equipped with air brakes.

JOHN J. GARTSHORE,
Toronto, Ont. 5-6

For Sale

Waterpower, circular sawmill in Parry Sound District, 1½ miles from railroad siding, together with 300 acres timber land. Would be excellent site for manufacture of wood specialties. For particulars address Box 974, Canada Lumberman, Toronto. 5-5

Mill Machinery For Sale

Complete saw mill plant for sale including two single cutting band mills, gang, and all equipment in first class working order. For particulars apply to the Dickson Company, Peterboro, Ont. 5-8

Straight Moulder For Sale

One 8-in. Goldie-McCulloch Straight Moulder and Matcher in perfect running condition. This machine is better than new, as the bearings and all the working parts have been tried and kept in good working order. The owner is replacing with a much larger machine. Price low.

J. RODERICK & SON,
St. John, N.B. 5-6

WOODWORKING MACHINERY: 3 24-in. Champion planers, matchers and moulders; 4 20-in. Ideal pony planers; 3 30-in. Ideal bandsaws; 1 No. 18 Hespeler combination rip and cross-cut saw table; 1 Cowan panel raiser; 1 2½-in. Waymoth variety turning lathe; 1 12-in. MacGregor-Gourlay four-side moulder; 1 54-in. Jackson-Cochrane resaw; 1 32-in. disk sander with boring attachment; 22 Cowan veneer press screws. H. W. Petrie, Limited, Toronto, Montreal and Vancouver. c

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents.

Position wanted as band saw filer, double or single cut. First-class references. Address Box 972, Canada Lumberman, Toronto. 5-7

Position wanted as Sawyer in Ontario or West on double cut or circular. Good references. Box 961, Canada Lumberman, Toronto. 4-5

Position wanted as Lumber Salesman for Province of Quebec and Eastern Ontario. Good references. Apply Box 971, Canada Lumberman, Toronto. 5

Position wanted as Bookkeeper or general office work, with a lumber firm. Best of references. Apply Box 970, Canada Lumberman, Toronto. 5

Circular Sawyer (married), desires position for the coming season, strictly sober and reliable. Long season desirable. Address Box 975, Canada Lumberman, Toronto, Ont. 5-5

Situation wanted as Sawmill Foreman or Superintendent. 28 years' experience with high capacity mills. Expert mechanic. Band mills a specialty. West of Winnipeg preferred. Box 958, Canada Lumberman, Toronto. 4-6

Saw filer, band or circular, wants position, 25 years' good experience. No booze fighter. Good references. Can give satisfaction. Box 300, Canada Lumberman, 119 Board of Trade, Montreal. 5-8

Forest Engineer wants position as Forester with lumber or pulp company. Graduate of Yale Forest School. Seven years' experience in Eastern and Western Canada and United States. Highest references. Box 1000 Canada Lumberman, Montreal. 5-5

YOU will reach YOUR man in applying to Box No. 966, Canada Lumberman, Toronto, if YOU are in need of an accurate and reliable Mill Accountant, for May 1st next. Eleven years' experience in lumber business. Highest references. Conversant with both French and English languages. Married. 5-6

First class right hand Band Sawyer wants to change. Now employed in one of the largest and fastest mills in Pennsylvania. Strictly sober and steady. 32 years old. First class recommendations.

D. RAY COLE,
Newwich, Pa. 5-5

BAND SAW FILER wants position. Twenty years' experience in United States and Canada. Can furnish gilt edge references. Would go where quality and quantity is wanted. Would expect highest wages. Single or double cut. Box 960, Canada Lumberman, Toronto. 4-7

Wanted-Position By Experienced Manager

To take charge of lumbering operations. Can get results and furnish the highest credentials. Canadian. Box 973, Canada Lumberman, Toronto, Ont. 8

Position wanted by experienced man as sawmill foreman. Could take entire charge of small plant. Understands handling men, and also lumber from stump to market. Have had twenty-four years' experience. Married man. Can give good references. Would take contract of sawing by thousand. Address Box 656, Haileybury, Ont. 5-6

Wanted-Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

Men for Sawmill Wanted—Engineer, fireman, sawyer, jacker, setters, tail sawyer, lath contractor, pilers and others for Band Saw Mill at Kearney, Ontario, for summer season. Cut is pine. State age, habits and firms previously employed with. None but men experienced in Saw Mills need apply. Apply J. J. Armstrong, Biscotasing, Ontario. 5-6

Business Chances

Wanted

party with from \$25,000 to \$100,000 cash to join the advertiser in the manufacture of a valuable timber property where the opportunities for making large profits are exceptional. Address Box 968, Canada Lumberman, Toronto. 5-6

For Sale

Timber limit consisting of 10,000,000 feet of Pine, Spruce, Hemlock and Hardwood, tributary to Lake Nipissing. Also sawmill and logging outfit, boom timber and chains. Good reason for selling. For particulars address Box 846, Canada Lumberman, Toronto. 19-tf.

If You Have a Son

whom you want to start in business, write stating the amount you are prepared to invest, his age, experience and capacity. This is an exceptional opportunity for the training and development of a young man, where the climatic conditions are perfect and the business opportunities unlimited. For Sale

Lumber Limits in Eastern Canada, 50,000 acres, large Sawmill, fully equipped going concern, on salt water. Correspondence solicited. Will be sold right to close estate.

Address, Timber Limits, care Canada Lumberman, Toronto. 22-t.f.

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf

For Sale

Rare bargain. Band mill located in best lumber and log center on Puget Sound. Rail and cargo shipping facilities. Excellent log pond. Ten and a half acres of land. Price one-fourth of appraised valuation. Must sell quick. Box 785, Canada Lumberman, Toronto, Ont. 8-t.f.

ESTEVAN, SASKATCHEWAN

Splendid opening for Planing Mill. Lumber Yard could be run in conjunction with advantage. 5,000 population; with large district to serve; cheap power, fuel, light, etc.; city growing rapidly, first-class business assured. Write immediately to the Secretary, Board of Trade, Estevan, Sask., Canada. 4-8

For Sale

Fir and Spruce Timber Limits in the vicinity of Fort George. Price right and terms liberal. Will be sold in quantities as agreed upon up to 45 square miles. Timber not excelled in British Columbia.

If interested apply for further information to D. J. McEACHERN, 3-6 Alvinston, Ont.

Fine Timber Tracts

We have a number of timber tracts for sale in most all states at low prices and reasonable terms. Have few bargain tracts that are offered for quick sale. Write us what you want, we have it.

THE JANESVILLE EXCHANGE, Timber Dept., Janesville, Wis. Dealers in timber lands, lumber yards, mill machinery, mills for sale, arranging loans, selling and exchanging cut-over lands, and a general real-estate business. 1-t.f.

Hardwood Limit and Saw Mill For Sale

On account of our having recently purchased a large Hardwood Timber Tract in Mississippi, we have decided to offer for sale our Hardwood Mill, Boarding House and all equipment situated a few miles from Kearney, Ontario. The Limit consists of 16 square miles and it has been cruised by the best rangers in the North, and on close estimate it contains the following merchantable timber:

7,700,000 ft. Birch.
2,000,000 ft. Maple, Elm and Basswood.
4,300,000 ft. Hemlock.
1,700,000 ft. Spruce.
500,000 ft. White Pine.
750,000 ft. Cedar.

14,950,000 ft.
Besides thousands of cars of Charcoal Wood. At present time we have:
450,000 ft. of Hardwood Logs.
500,000 ft. Hemlock and Spruce logs.
cut and on skids in the woods. The mill is circular and fully equipped with 90 h.p. engine and 150 h.p. boiler, double edger and trimmer. Also large Boarding House with all equipment, Blacksmith Shop and tools, Oil and store houses and everything that is needed in a going operation. This is one of the best propositions in the North and can be bought as running concern on most favorable terms. Here is excellent opportunity for man who understands the business to make good profit without taking any risk.

Terms, \$5,000 cash, balance arranged to suit purchaser, or would consider retaining part interest with right partner. Price and further particulars on application.

WILSON LUMBER CO., LTD., Toronto, Ont.

Miscellaneous**Coal and Timber**

Will purchase in large tracts only, either in Canada or the United States. We are principals and only deal with owners. No agents or options. Address "Cash," c/o Canada Lumberman, Toronto. 4-7

Saw Mill Machinery For Sale

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company, Brantford, Canada. 22-t.f.

Axioms on Air

A pile of lumber is dry only when the centre of the pile is dry. This is as true of the pile in the kiln as it is of the pile in the yard.

The sides, ends, top and bottom of the standard pile dry more rapidly than the centre.

The remedy is: Pile the lumber in such a manner that the centre gets as much circulation as the outside.

Edge piling is the most positive; and the side pitch pile is next in effectiveness.

The medium for drying lumber is air, and this air, to be effective, must be in motion over the surface of the lumber.

Stagnant air takes up moisture very slowly, while air that is in motion takes up moisture rapidly.

Washing hung outdoors, even on a cold day, with a breeze blowing, dries very quickly, while washing hung in a closed room dries very slowly, even though the room be hot.

A pile of lumber through which the air can circulate freely will dry more rapidly and evenly than a pile in which the circulation is obstructed.

Lumber, especially sap, will mildew in stagnant air just as old linen will mildew in a damp corner.

Therefore, the main requisite for drying lumber is freely circulating air—air freely circulating through the entire pile.

Air cannot be confined in an inclined flue that is open at both ends.

Air will constantly move in an inclined flue that is open at both ends.

Review of Current Trade Conditions

Ontario

The trade outlook in Ontario shows encouraging improvement. Wholesalers report that they are booking a considerable amount of business already and that there are good prospects for steady trade expansion from now on. Lath are practically off the market. B. C. shingles are firm. Although the yards throughout the country seem to be pretty well stocked in shingles, there is a fair demand. Mill cull pine is very scarce and the demand is good, so that prices continue firm. The same conditions prevail in regard to dead culls. Hemlock is not showing any increased activity, as it is still obliged to face the strong competition of southern pine. It is holding its own in price however without difficulty. Spruce is quite strong, being held firmly by eastern mill men, who are now finding a better market in the eastern States. The demand for spruce continues good.

The lumber trade at Ottawa is still feeling the effects of the severe weather. A few good sales have been reported by Ottawa firms in Montreal and Toronto and in Northern New York. Prices in general are firm although pine box boards 1 x 4 in. and up, 6 ft. to 11 ft. are easier. Pine box boards 1 x 3 in. to 6 in., 12 ft. to 16 ft. are firmer.

Eastern Canada

The lumber trade at St. John and other New Brunswick points has been very quiet during the past fortnight, largely on account of the severe weather. This has been a favorable factor, however, in connection with logging operations and the present indications are that there will be plenty of water for the drives. The cut of logs on the St. John river this year will probably be about normal. Most of the mills have a fair amount of logs left over from last season's operations, so there is every likelihood that the mills will be well-stocked for the 1914 cut. Most of the mills which saw English deals have sold their cuts for the coming season at a slight advance on last year's prices. This advance will probably be used up however, in the payment of increased wages in the woods and the cost of supplies which has been higher this winter than formerly. Specifications running 50 per cent. 7 and 8 x 3 in., balance 9 x 3 in. and up are bringing about \$17 per M. No improvement is reported in the American market and buyers are not making contracts ahead for 1914. It is not expected that improvement will be shown in this market until the Interstate Commerce Commission has given its decision in connection with the application of the railway companies for an increase in their rates. Cuts of lath are selling at about the same price as last year.

Bad weather conditions at Boston have interfered with trade of late. Southern pine and North Carolina roofers are reported a little stiffer, but very hard to sell at the 50 cent advance. For 1½-in. spruce lath, the price is around \$3.75 or \$3.80. Shingles are weak, although prices are unchanged. Spruce frames are selling at \$24 or \$24.50, with an occasional report of a sale at \$25.

Hemlock boards at Boston are still moving slowly. The top price for eastern clipped hemlock is about \$23, although some dealers are asking \$24. As low as \$22.50 is sometimes being taken on car load lots. Stocks of hemlock at New York are low in the yards and enquiries are coming in and steadying the trade situation. Red cedar shingles from Vancouver are selling at \$3.65 to \$3.75 at Boston and there are rumors of a probable advance.

United States

The spurt which developed recently in connection with retail yard buying received a rather rude check during the second and third weeks of February when zero weather gripped most of the Northern States and hung on for several days. In reality, however, this is only a temporary affair as it had become fairly evident that the retail yards are generally short of stock and are looking forward to an active spring trade. An adverse factor has been the postponement until September of the decision of the Interstate Commerce Commission in connection with the application of the railroads for various increases in their freight rates. In the New England States it is reported that this has induced the railroads to remain out of the market. Reports from other districts, however, are to the effect that this will not have any appreciable effect upon the market as most of the railroads are buying in a quiet, but fairly steady manner, indicating that they are in need of supplies and intend to buy whether the increases are granted or not. Reports of building operations show a natural falling off in the larger centres, but in some parts of the country there are encouraging indications of increased operations where building activity has been rather quiet for a considerable period.

Weather conditions have been favorable for logging operations

in the north, but many mill men are still ignoring indications of increased business, which in former years they would have considered sufficient to warrant increased production. There is a fairly general tendency towards a restricted or at best a normal production. This does not apply however to the yellow pine districts, in which production is going on steadily. There is not, however, the former excessive over-production and there is sufficient firmness to the market to enable some millmen to add 50c or \$1 to their prices every now and then. These advances moreover, are as a rule willingly met by the consuming and distributing trade.

Hardwoods are continuing on their customary steady basis, both price and demand showing little alteration. Prices may not be altogether satisfactory, yet a tendency toward improvement is encouraging mill men to produce at a normal rate.

Logging operations in the Northern pine districts have been favored with excellent weather. Recent reports from Duluth tell of a contract sale of 15,000,000 feet of No. 3 common and better, the largest deal announced in several weeks. This stock goes to the Boston market. There is no excess of northern pine stocks. An active spring building trade is expected, although yards have not as yet been buying in a large way. Chicago dealers are expecting improved conditions as soon as the cold spell passes. Building permits are about normal, but much new building is in prospect. A feeling of confidence is spreading among the Chicago trade in general.

Great Britain

The lumber business at London continues on a quiet, but steady basis. F.o.b. business is increasing and looks fairly promising. The present stocks of deals and battens appear sufficient for the demands of the trade until about the end of May. At Foy Morgan & Company's recent auction sale, 3 x 9 in. third Montreal spruce was sold up to £11 15s.; second Quebec up to £12 10s.; Quebec fourths at \$11 10s., and 10 ft. and 11 ft. second Quebec brought £11 10s.

The recent reductions in the bank rate gave quite a stimulus to trade. This is expected to result very soon in greater business activity. Business at Liverpool is progressing steadily in nearly all branches of the whitewood trade. There is no evidence of a slump and the consumption of the most prominent articles is good, even as compared with the boom period in 1913. Stocks of spruce deals from St. John and Halifax have been reduced considerably and, at latest reports, stood at 6,700 standards. A large reduction was also reported at Manchester. The position of this stock, however, is more favorable than it was a few months ago. No transactions for next season's shipments had been reported, at latest advices. Both importers and shippers appeared to be in doubt about the freight market, which is the great factor in the future delivery business.

Trade in Canadian pine deals is quieter than it has been for many months. The consumption during January amounted to 550 standards, while the stock on hand at Liverpool at the end of January was 8,690 standards. The stocks were held by about two houses.

At Manchester, the import of spruce in parcels from Halifax and St. John has been below last year's figures, but the stock on hand is very much larger than it was a year ago. A fairly satisfactory consumption however, is reported and it was expected that by the end of February the quays would be practically cleared of outstanding cargoes.

Trade at Glasgow has not been very active. Quebec shippers are now in the market and a moderate amount of contracting is reported to have taken place, principally in log timber and the lower grades of pine deals.

H. R. Pousette, Canadian trade commissioner in South America, is in Vancouver, B.C., to investigate the possibilities of extending the lumber trade of British Columbia in the southern continent. He reports that the best opportunity for Canadian lumbermen is in Chile, Peru and Bolivia. Chile and Peru import a large quantity of Oregon pine.

The Mountain Lumber Manufacturers' Association whose head offices have formerly been at Calgary, Alta., have selected quarters for their new head office at Nelson, B.C., and will move there about the middle of March. The offices will be in the Annable Block.

A large amount of British Columbia lumber will be used in the interior finishing and in the construction and equipment of the B. C. Provincial Building which is to be constructed in London, England.

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

Cold Weather Helps New Brunswick Loggers

St. John, N.B., February 23rd (Special to the Canada Lumberman): The last two weeks have been a season of resting. The yards and factories are only fairly busy. Of course one of the causes of the cessation of business is the excessively cold and stormy weather which we have had and which has interfered with work. Should this weather keep up during the next two weeks it will cause a considerable loss to the building trades. While the cold weather and snow have been the means of slowing up work in the city, they have been of great benefit to logging operators, all of whom are getting well along with their hauling. By the first of March about all the logs will be off the yards and on the banks of streams and rivers. The cut of logs for St. John will be about normal. No calculations were made for any extra cut, many logs being held over by the mills from last season on account of the strike of the millmen which caused the mills to be idle for three months of last year. Prospects for driving look good. There is from 3 ft. of snow at the head of the St. John to 1½ ft. nearer the city, much of which is ice. This should cause a good flow of water. The cost of logging during the past season has been somewhat higher than last season, caused by increase in labor wages and in cost of supplies.

About all the mills which sow English deals have sold their cuts for the coming season, at prices which, while a little higher than last season, will not net the owner any more than last year's prices, as logs will cost enough extra to offset the increased price. Specifications running 50 per cent. 7 and 8 in. x 3 in., balance 9 x 3 in. and up are selling for around \$17 per M., with scantling at \$2.50 per M. less, and deal ends at two-thirds the price of deals. The larger proportion of deals have been sold to W. M. Mackay, who has purchased, it is said, Messrs. Randolph and Baker's and Messrs. Murray and Gregory's cuts. The balance of the cuts are held by John E. Moore and Geo. McKean.

The American market does not seem to improve, especially for the cargo mills, the buyers being very reticent about making any contracts ahead for 1914. It is felt that business will not improve to any extent until the Interstate Commission allow the railroads to increase their rates. This they have now held over until September 12th, when it is supposed that their decision will be handed down. The railroads are simply out of the market for lumber and are not making any purchases whatever. This is felt very much by the manufacturers, as the railroads have been the heaviest buyers in the past.

Cuts of lath are being bought ahead from the mills here at the same price as last year, viz., about \$2.75 per M. for the season's cut.

About all the mills are now being made ready for the season's sawing, which of course will not begin much before the first of April, but a large amount of repairs is always necessary.

Improvement Continues in Montreal Trade

Montreal, February 24th (Special to the Canada Lumberman): During the past fortnight there has been a continued improvement in the lumber trade. Business is increasing in almost every department, and the outlook is very good, especially for lumber for residences and flats. So far, the projects for large buildings are not of great importance, but the probability is that contractors for houses will be very busy. On every hand there is a great demand for houses of the medium and cheaper descriptions, although to speak of cheapness in connection with Montreal houses is something like a misnomer.

Prices of lumber continue very firm, and some dealers are of opinion that quotations will advance when the spring comes. Stocks are scarce, and it is probable that, before long, dry lumber will be practically unobtainable. There is almost a famine in lath, due largely to the short cut last year.

The estate of the late Mr. J. H. Redfern is in the hands of a trust company, and is being gradually liquidated, in accordance with the terms of the will.

The Owens Lumber Company, Limited, have just completed a small mill at St. Amade, near Montebello, P.Q., with a capacity of about 12,000 feet per day. The mill is manufacturing hardwoods, principally birch, on the limits owned by the company.

It is understood that the pulp wood of the East Canada Power and Pulp Company, Limited, in liquidation, has been sold to the Donohue Company, Quebec. The pulp wood is in the yard of the mill at Murray Bay and also uncut on the limits on the Murray River and its tributaries. The sale was by tender, one of the conditions being

that the successful bidder may have, if desired, the use of the mill and mill property for the purpose of manufacturing the wood into pulp until the 1st September, 1914.

Ottawa Trade Continues Quiet

Ottawa, February 23rd (Special to the Canada Lumberman): The prolonged cold spell does not encourage immediate activity in the trade, but there are signs that when the weather breaks, things will begin to move again. Locally, trade is exceptionally quiet. Some fairly good sales have been made recently by Ottawa firms in Montreal, Toronto and an odd city or two in northern New York. Prices continue to remain firm with little prospect of changing in the near future. Pine box board 1 in. x 4 in. and up, 6 ft. to 11 ft. have gone off a dollar to \$17 and \$18, while the same class of boards in 1 in. x 3 in. to 6 in., 12 ft. to 16 ft. are a dollar firmer at \$19 and \$20.

A verdict for \$500,000 was given against M. J. O'Brien, of Renfrew, the well-known millionaire lumberman and contractor, in the Quebec Superior Court at Bryson, last week in favor of R. Rainboth, of Aylmer, Que. The dispute was over some timber limits in Pontiac County, in which Mr. Rainboth sought to acquire a quarter interest as the result of a contract he made with Mr. O'Brien.

Mr. Rainboth claimed that, by the terms of the contract he made with Mr. O'Brien, he was to have a quarter interest in the limits, which are on the line of the Transcontinental Railway, providing a certain figure could be secured for them. Twice the limits were put up for sale by public auction, but the price offered was not as large as required. Later they were disposed of by private sale to Mr. O'Brien, and were pledged to the Merchants Bank for \$750,000 and a sum amounting to \$42,000 was paid out in Crown dues and other expenses. Seeing that the limits were pledged to the bank, which had power to dispose of them, Judge Weir, who tried the case, held that Mr. O'Brien had legally parted with the limits and as they are now valued at \$2,000,000, Mr. Rainboth is entitled to \$500,000, less his share of the \$42,000 expenses. The case will be appealed.

During the past week a controversy has been going on in the Ottawa newspapers concerning conditions in the lumber camps. Some lumberjacks, who have returned to the city recently have held that the camps are not sanitary and that the conditions in general are far from being as comfortable as they might be. The chief grounds of complaint have been poor food, low wages, and the high prices charged for clothing, etc. Denials to these charges have been made by the heads of leading firms, all of whom claim that the conditions in the camps are infinitely better than they were five years ago. As to the charges that the camps are not sanitary, the fact that they are under inspection of the provincial governments is cited. In short J. R. Booth, Shepard and Morse, and all the leading lumbermen say that the charges emanate principally from men who expect to find a lumber camp as well fitted up and as convenient as a first-class hotel.

H. M. Williams, of the Williams Lumber Company, is now in England on a two months visit, during which he will combine business with pleasure.

E. R. Bremner, local manager for Watson and Todd, left last week for England on business.

London Market Report

Churchill & Sim, London, England, in their monthly wood circular under date of February 4th, say that importations from New Brunswick during January, 1914, were as follows:—

Pine deals	3,000 pieces	against	Nil pieces in 1913
Spruce deals	30,000 "	against	27,000 "
Birch planks	16,000 "	against	13,000 "

The trade in pine deals was a small one in January and prices show no variation. Spruce has been going into consumption slowly. The stock is ample and buyers are holding off from further purchases at present. Some hardwood planks have been sold at about December rates, but the London demand generally leaves much to be desired. No change is reported in the market for British Columbia and Oregon pine. A few sales of long logs have been arranged for at about the last prices, but the demand has been disappointing.

Better Trade Situation at Liverpool

Smith & Tyrer, Limited, Liverpool, Eng., in their monthly market letter under date of February 1st say: The year has been ushered

SATISFACTION FOR SALE

OUR Lumber is manufactured with a Purpose. From the Stump to the Finished Product this Purpose is never forgotten. We aim to make our Products and Satisfaction synonymous. We want every car we ship to be filled not only with Lumber but with Satisfaction.

We are equipped to give you uniform grades—dry stock—fine planing mill work—good service and courteous treatment.

When buying of us, your worry, your anxiety, is over with the placing of the order. You know you will get what you want—in the way you want it—that upon arrival, you will be pleased. It will make your business a source of pleasure and happiness.

OF DRY SPRUCE IN CANADA

in with a period of quiet business, but some revival of activity has been shown towards the end of the month, and the situation generally may now be considered on a better basis. Pitch pine.—Hewn timber is little enquired for. Sawn timber has firmed up somewhat as a reflex of the Pensacola troubles, but buyers are still shy, and some shippers are showing eagerness to realise their stocks. Freight continue very low. Prime lumber has gone much weaker; the slackness on the Continent has contributed to this. Lower grades are enquired for only to supply special orders. U. S. A. hardwoods.—There has been a quiet business done, without much change. Spruce deals have been steady but nervous. Stocks at the liner ports are sufficient, and buyers are afraid of shipments arriving too freely. Forward business has not yet seriously opened. Birch.—There is a fair demand for logs, but planks are not wanted. Hemlock can only be sold at low figures. Pine is unchanged, with only a quiet demand. Pacific coast woods are dull.

Liverpool Market Report

Farnworth & Jardine, Liverpool, England, in their monthly wood circular under date of February 2nd report as follows:—In the business of the past month there is little change to report. Arrivals generally have been moderate, the deliveries compare favourably with the corresponding month of last year, but the demand is not active, and stocks of some of the leading articles are too heavy. Prices are fairly maintained, but contracting for next season's supplies so far has been slow. Ocean freight rates quoted are moderate.

Canadian woods.—Pine timber.—There is no improvement in the demand to report, but values rule high; stocks are moderate. Waney pine, 1st, class: One small parcel arrived in Manchester. There has been a high consumption, and stocks, though slightly reduced, are sufficient; values are firm. Second class is only in limited demand; the present stock is ample. Red pine.—No arrivals; seldom enquired for. Oak.—The import (delayed in transit) is largely balanced by the consumption; the demand is not active, but stocks are moderate, and prices remain steady. Elm.—No arrivals; the stock is firmly held, but the demand is quiet. Values rule on a high basis. Pine deals.—About 400 stds. imported to Manchester. The consumption has been disappointing. Prices are steady, but stocks are adequate for probable requirements. Red pine deals are only in limited request.

New Brunswick and Nova Scotia spruce and pine deals.—The import to the Mersey (including Manchester) was fairly moderate, viz., 2,410 stds., against 4,260 stds. in January, 1913, and chiefly discharged in Liverpool. Deliveries have been large, and the stock, although reduced, is still too heavy. Values are unchanged. Pine deals are only in limited demand.

Birch.—Logs.—The import, chiefly from Quebec, amounts to 8,000 cubic feet, largely to Manchester. Stocks are light, and there has been more enquiry. Prices are firm. Planks reached this market in moderate quantities. The consumption has been good. The stock is not excessive, and prices are well maintained.

British Columbia and Oregon pine.—The arrivals amounted to 29,000 cubic feet, chiefly lumber. The consumption has been fair, but stocks are heavy. Prices are unchanged.

Sales during the past month have included the following:—Spruce deals from St. John, N.B., etc., liner parcels at from about £8 15s. to £10 per standard c.i.f. according to specification. In their "prices current," Messrs. Farnworth & Jardine quote as follows:—Quebec square yellow pine 2s. 9d. to 4s. per cubic foot; Quebec waney board pine 3s. to 5s. 6d. per cubic foot; St. John pine 18 in. average, 2s. 6d. to 3s. 6d. per cubic foot; red pine 2s. 2d. to 2s. 9d. per cubic foot; St. John birch 1s. 7d. to 2s. 2d. per cubic foot; birch planks 1s. to 1s. 6d.; St. John spruce deals £9 5s. to £10 per standard; spruce boards £8 5s. to £9 5s. per standard.

Quiet Trade at Boston

The Shepard & Morse Lumber Company, Boston, Mass., report that trade is very quiet in Boston at present. The weather has been exceptionally bad for building operations. Prices on low grade Southern pine and North Carolina pine roofers, for instance, have stiffened a little, but are very slow sale at 50c advance. 1½-in. spruce lath are selling at about \$3.75 or \$3.80. Shingles have been quite weak, although market prices have not decreased. The top prices however, are difficult to obtain and can only be secured for particularly fancy brands. Spruce frames have sold in some cases at \$24 and in others at \$24.50. There is not much moving at \$25 now.

Trinidad Market Active

Gordon, Grant & Company, Limited, Port-of-Spain, Trinidad, report under date of February 2nd as follows: Lumber—Our market being ready for further supplies, the recent arrivals of pitch and white pine will not in any way affect values. Active building operations afford a good outlet, and all descriptions are readily saleable.

Personal and Trade News

Mr. J. K. L. Ross has been elected a director of Laurentide Limited, to fill the vacancy caused by the death of his father.

Dr. B. E. Fernow, Dean of the Forest School of the University of Toronto, has been elected president of the Society of American Foresters.

Mr. William Price, president of Price Bros. & Company, Limited, Quebec, P.Q., expects that the present year will show a much improved business in the lumber department, but that the pulp trade will not be so active.

Mr. W. Booth, for some time secretary-treasurer of the Campbell-MacLaurin Lumber Company, Limited, Montreal, has been appointed secretary-treasurer of J. R. Baxter and Company, mill supplies, Montreal.

Mr. W. A. Anstie, managing director of the Forest Mills of British Columbia, Limited, Revelstoke, B.C., recently made a business trip in Ontario and was a welcome visitor at the offices of the Canada Lumberman.

Mr. W. E. Nitterauer, of the Munising Company, Munising, Mich., was in Toronto during the third week of February on a business trip. The Munising Company operates a sawmill, paper mills, mines, etc., on an extensive scale. They are considering important increases to their lumber output, during the coming year. At present they are turning out hemlock and hardwood and report that the competition of yellow pine with hemlock in Michigan is very strong.

At the annual meeting of Price Bros. and Company, which was held recently at Quebec, the report of the lumber department showed that it had made attractive profits on its year's operations. Satisfactory prices were received for the company's lumber output during the year. The company's total earnings at its various operations amounted to \$512,527. After deducting bond interest and maintenance charges, the net profits amounted to \$338,739.

Campbell-MacLaurin Lose Valuable Employee

The death occurred recently of Mr. William Dick, mill foreman of the Campbell-MacLaurin Lumber Company, Limited, Drummondville, P.Q. Mr. Dick was a Scotchman, and was at one time employed by Messrs. Muirhead and Sons, Grangemouth sawmills, Scotland, and later as general manager of the mill and yard of Messrs. Graham, Roxburgh and McLauchlan, Firhill Saw Mills, Canal Bank, Glasgow. In 1907 he came to Canada and was engaged by McLaren Bros., Buckingham, and in 1908 joined the staff of the Campbell-MacLaurin Lumber Company.

Moose Jaw Pioneer Lumberman Dead

Hugh McDougal, a pioneer lumberman, of Moose Jaw, Sask., who went west from the Ottawa Valley in 1883, removing from the prairie city to the Okanagan Valley in 1902, died at Peachland, B.C., on February 18th, aged 80. Mr. McDougal owned a lumber mill at Peachland for some years and was well known in the Okanagan. He is survived by a wife and grown-up sons and daughters, and leaves relatives in the Ottawa Valley, Moose Jaw, Vancouver and Victoria.

Lumber Mutual Present Good Report

The Lumber Mutual Fire Insurance Company of Boston, Mass., in their annual financial statement for the year ending December 31st, 1913, showed a net cash surplus of \$538,502.11. The total amount of insurance in force is \$19,810,579.49, upon which the premiums amount to \$442,290.26. The total losses paid to policy holders to date is \$1,237,461.64, and total dividends paid to policy holders to date \$1,139,203.84. The rate of dividend to policy holders on terminating policies is 40 per cent. The gain in the amount of insurance in force during the year 1913 was \$1,622,666.83, and the gain in premiums for the year was \$34,520.75.

New Brunswick Crown lands comprise an area of over 10,000 square miles, and the annual revenue to the province is over half a million dollars. It is proposed, in view of the extensive areas of pulp wood lands, to create a forestry branch in connection with the Crown Lands Department of the Province, which will be in charge of a technically trained forester.

Statistics issued by the provincial forest branch of the Department of Lands at Victoria, B.C., show that the cost of timber fire protection for the year 1913 was much less than for any previous year in the history of the department. The cost for fire protection during the first ten months of 1913 was less than \$8,000, as compared with \$30,000 in 1912, \$100,000 in 1910, \$45,000 in 1909, and \$35,000 in 1908. There were 900 fires during the season, only 96 of which could be considered serious.

Canada's Largest Saw Mill

Douglas Fir Timber

We manufacture and ship on short notice all sizes and lengths of merchantable timber up to 120 feet in length for derricks, scows, dredges, shipbuilding, bridge and structural timber. We dress timber up to 24 x 30.

Dressed and Matched Lumber

Write us for prices on rough or dressed clear fir and

cedar. We make quick shipment of clear fir flooring, siding, ceiling, shiplap and boards, also red cedar bevel siding.

Douglas Fir Cross Arms

Douglas fir base casing and mouldings manufactured to standard patterns at close prices, shipped with doors or cedar shingles.

British Columbia Red Cedar Shingles

We make our own shingles and place our brand on them, which is our guarantee that they are manufactured fully up to grade with regard to quality of material, sawn to full thickness and tightly packed.

We want your permanent trade. Let us ship you one car.

B. C. Fir Doors Are Perfect Doors

We are now making 1000 perfect fir doors each day and can double this output on short notice. Our door sales are increasing rapidly and the reason is that we are making a perfect door with regard to quality of material and workmanship. Prices and information furnished on request.

Three ply rotary cut fir veneer makes beautiful panelling.

Canada's Largest Door Plant

Handling Mill Waste

At the recent annual meeting of the Retail Lumber Dealers' Association of the State of New York, an interesting paper on the handling of waste, was read by Mr. Henry T. Lumb. In the course of his remarks Mr. Lumb said:—

We have made a number of tests and while some have shown 16 per cent. and 12 per cent. and even as low as 8 per cent. waste, others go up to 19 per cent., 25 per cent. and 27 per cent., and in many cases even higher. This is based on all first and second grade lumber, which we have found best for our trade. The percentages have varied so that we have been using an assumed percentage of 25 per cent. except on North Carolina pine trim, where we use 15 per cent. as we get this out of stock widths.

I have recently written a number of other firms to get their ideas on the subject and received replies from a few as follows:

A—states: "We have not on hand now any data to furnish the information which you request. Of course you and ourselves realize that it is a very important part of our industry; that is, the waste in cutting up lumber. There are a great many mills, it seems to the writer, who do not recognize this fact. We have made test after test on different kinds of lumber, and find the loss in cutting up amounts to from 20 per cent. to 40 per cent., depending entirely on the quantity of the lumber you cut up, and also on the character of the work that you are cutting for.

In connection with cutting up lumber for trim, that of course depends upon what you are cutting up. Our idea as to the loss in cutting oak, for instance, is that there is about 30 per cent. loss, if one is cutting up a good grade, running about 50 per cent. No. 1 common and 50 per cent. 1's and 2's."

B—states: "Replying to your favor of the 19th, would say that the amount of waste in cutting lumber depends entirely on the quality of the lumber and we do not think that any fixed rule would be of avail."

C—states: "This depends largely on the kind of stock you use, and is rather a hard question to answer. We find quite a difference in some of the cutters; that is, some of our cutters waste more stock than others, and to give a definite amount of waste we are not in position to do so.

Some mills use a lower grade of material and think it is cheaper, while we find our experience has taught us that it is better for us to purchase a better grade of material in cutting trim, as we have much less waste.

We find also that some orders cut to better advantage than others, as we work up small strips, etc."

D—states: "Answering yours of the 19th, will state that we manufacture only veneered doors and buy only the better grades of lumber; in fact, we try to order our stock 75 per cent. 1's and 2's and 25 per cent. No. 1 common, for the reason that we have no way of working up our offals because we do not manufacture trim, blinds, sash, etc.

Even taking into consideration the above facts, we allow 50 per cent. on practically all woods except quartered oak, on which we allow 60 per cent. This percentage of waste we add to the actual amount of lumber determined by the cutting sizes."

E—states: "We think that in all good trim where we use the best of stock our actual loss in cutting is about 15 per cent., and where we use lower grades of stock to make a fairly good output the loss is about 30 per cent. All this, however, is not lost. We sell some wood and we use core lumber and have a surplus as a rule. We have had experts here to try to tell us what it costs to produce our output but nobody has yet succeeded and we have never been able to definitely ascertain it ourselves.

Formerly in manufacturing in a stock mill in Michigan which the writer owned, making all stock work, sash, doors, and blinds, our percentage of waste figured 25 per cent. on the sash and blind work, but the total loss figured only 10 per cent. and we used only No. 2 and No. 3 shop. Of course lumber was very much better those days than it is now, that being about ten years ago."

F—states: "We only handle sash, doors and blinds and therefore can only speak as to the waste incurred in cutting these items. Our experience covering a period of some thirty odd years has been that 30 per cent. of the cutting up grade of lumber like No. 1 and No. 2 shop or cuts No. 1 and No. 2 common disappears, often being put in the mill to work up. This may seem high but it is actually so, as we have demonstrated to our complete satisfaction time after time. It is a little less on the higher grades but not much unless you use stock widths, which it is very hard to do. This waste matter is something that the average mill man does not seem to appreciate or does not feel that it is important enough to spend much time on, but we consider it a very vital part of manufacture."

From the above it will be seen that there are many different ideas of the percentage of waste, and most of us are doing more or less guessing and are therefore probably not getting the price we should for our product. The point I should like to bring out before you is that all seem to be basing their waste on occasional tests, and I should like

to bring up for discussion the idea of keeping records for an extended period, say a year, on the waste of all orders. Perhaps someone has done this and his experience would be of great assistance in planning a systematic method for other firms to obtain their actual waste.

I have noticed considerable discussion of cost keeping, pertaining to overhead charges and distribution of labor, but I have not seen anything relating to exact percentage of waste of lumber. We are generally getting so that we have accounting systems that give us overhead charges down to a tenth of a per cent., but in the matter of material, which is by far the most important item, we are guessing. I think most of us are making tests of occasional orders and after the lumber is brought into the mill and cut into pieces and lengths required, we make allowance for pieces and strips left over which we expect to use again. This cannot be an exact basis, as we all know some jobs cut to better advantage than others, and some waste works into other orders and some which we expect to use is finally put into fire wood. Most of us are basing our estimate of waste on these occasional tests and I think by a careful study of the subject with a systematic method it can be improved on. Some firms charge all the material brought into the mill on the job regardless of the waste, but I do not think this is right. Probably we should not figure costs so close on our product that we should get much closer than either of the above mentioned methods, but I do think we should at least know exactly, as the records will help us in many ways in knowing the proper grades to buy and also how efficient our cutters are, and I do not think this can be obtained by occasional tests, but only by keeping records of all the material used for an extended period.

I really think the successful dealer who is operating a mill in the future is going to be the one who knows when to buy goods already manufactured instead of making them himself and in order to do this he must know his costs, which must necessarily include an accurate percentage of waste on his lumber.

My proposition is to keep a record of exact cut to size of all pieces in every job, taken from duplicates of all cutting lists, no cutter or any employee being allowed to use any material without a cutting bill or requisition. Our inventory at the beginning of each year with lumber purchased during the year will of course give us the exact amount of lumber brought into the mill, the difference between the two records being feet wasted on all kinds of lumber for the year. This will require no tallying or red tape among the employees in the mill but simply a clerk in the office.

In trying to apply this method to our own business, we think that in connection with our present system of billing our telephone girl could tabulate all the sizes from cutting bills systematically and not miss any. We thought instead of figuring the number of feet, board measure, in each piece, we would get up a card system with a card for all the different widths and thicknesses and different kinds of lumber and only put down the lineal feet. For instance, if there were 10 pieces of chestnut casing 1 x 5 7½ feet long, it would be put on a card headed "chestnut 1 x 5" and entered "75 feet." At the end of the month or year, if found necessary, we would reduce the total of all the lineal feet to board measure at one calculation. Now, the difficulty is going to be in getting the waste on the different kinds of lumber when different grades are used of one kind, such as pine. For instance where No. 1 pine cuts are used for doors and No. 3 pine cuts for sash and blinds, the waste from No. 1 which might be used in with No. 3 for sash, the clerk in figuring up the cutting bill of sash would not know whether to credit up as coming out of No. 1 or No. 3 cuts. I have thought this might be accomplished by crediting up to No. 1 cuts or No. 3 cuts what is known to have come from either of these grades and what there is a question about could be credited to a miscellaneous pine account. This would probably be such a small proportion of material cut that it would give very nearly accurate figures. Of course in lumber where all one grade is purchased, it would be simple. In connection with this, I might add that in return for the expense and trouble of this system we might consider that we will always have a perpetual inventory. After this method has been kept for a year with possibly a second year to check it up as to its relative accuracy, we could tell at any time our stock on hand and in case of fire it would be valuable to have.

Now, would it be possible to apportion the waste credited to the miscellaneous account to the different grades at the end of the year according to the proportion of each kind used? Again, is it possible to work the whole matter of waste out on the cost of lumber basis? These are the two important parts of the proposition I haven't been able as yet to work out clearly myself, and I should like to hear some discussions from others on these two points and also the waste proposition on a whole.

A large amount of pulpwood and lumber is being shipped on the Transcontinental Railway east of Quebec bridge. The line is not yet complete, but will be by May. It is estimated that at least 10,000 carloads of lumber and pulpwood per annum will be carried.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

Aerial Skidding

By Jno. A. McDougall, Fernie Lumber Co., Ltd., Fernie, B.C.

While undoubtedly there are minor matters in connection with the aerial skidder which we are operating which could be, and perhaps already have been, improved upon, we are of the opinion that this machine, owing to the comparatively small amount of rigging in connection with it, and the consequent minimum delay with which it can be moved around, is the most suitable machine for the class of timber and the rough mountainous country in which we are operating.

It is a four-drum machine, one drum containing 3,000 feet of one-inch cable, being the main line; one drum containing 3,000 feet of $\frac{3}{4}$ -inch cable, being the haul-in line; and one drum containing 6,000 feet of $\frac{5}{8}$ -inch cable, being the haul-back line. The other drum is intended for loading the logs onto the cars. We have not used it for this purpose, but have used it and found it very handy for skidding the trees onto the rollways to be cut into log lengths.

The machine is set up at the landing, the main line being run out and made fast to a suitable tail tree. In the event of the main line, after being stretched, sagging so as to come too close to the ground or striking the ground on account of the uneven nature of the country, one or more gin poles are put up and the main line is held up from the ground by one of the "C" hangers, the open side carriage being specially constructed so as to allow the bottom part of the "C" hanger to pass through it.

We have found that we can cut a swath 150 feet wide or 75 feet on each side of the main line and handle it expeditiously, but our operation being side-hill work we have not considered it advisable to try to go further away from the main line than that distance. We have operated advantageously with practically speaking the whole length of the main line—that is 3,000 feet.

The slack pulling arrangement is simple and effective consisting of some thirty feet of light chain hanging to the bull hook on the end of the haul-in line. The hook tenders carry a short length of chain, about three feet, with a swamp hook on one end and a chain hook on the other end; this is made fast to a suitable stump, handy to the main line, and as the carriage comes back from the landing the chain hanging from the bull hook is caught and made fast to the short chain, the carriage being allowed to go on into the woods until the necessary amount of slack has been secured.

We have found it most advantageous to fall the trees so that they will lie as nearly as possible at right angles to and with the top towards the main line; the carriage is then held stationary until the trees are up to the main line and clear of all obstructions.

The timber which we are handling with the machine runs about ten logs to the thousand and five logs to the tree. We pull in one or

Aerial Skidding—Log carried horizontally

two trees at a time, according to conditions, the trees being cut into log lengths at the landing.

The minimum 10 hour day's work for the machine is 30,000 feet with a crew of 18 to 20 men, according to conditions, at a maximum cost of \$2 per 1,000 feet, on average skidding distance of 2,000 feet. This includes all working expenses, from the falling of the trees to the decking or loading of the logs at the landing.

We are not operating at all this season and have therefore not really given the machine a thorough try-out; it is new to ourselves as well as the men. But we are satisfied from careful observations made, that with a crew of good live men, we can put in from 35,000 to 40,000 feet easily and thus cut the cost considerably.

The country in which we have been operating the machine is too steep for horse logging to be practical, so that we are not able to make any actual comparison.

Our average cost of logging with horses has been around \$5 per

1,000 feet at the landing, and we are so well satisfied that, for the country in which we are operating, the aerial system is the best method—being both cheaper and cleaner—that it is our intention to put in more of these machines and do away with horse logging entirely if possible.

The system is like any other innovation; it takes a little time to break in the men and get them used to the work, and our experience when we first started to operate was anything but satisfactory; but they soon get the hang of it.

One very important advantage of the aerial system is that you can operate almost as cheaply in six feet of snow as you can on the bare ground.

Nearly a Mile of Single-Span Cableway

A new overhead cableway skidder, which establishes a remarkable record for distance, has been installed in the Great Smoky Mountains at Elkmont, Tenn., by the Elkmont Contract and Supply Company.

The main cable stretches from the peak of the boom on a self-contained portable skidder, to the top of a hill three thousand five hundred and seventy feet distant, without any intervening support.

Over this lengthy span they are skidding hardwood logs running four to the thousand feet without trouble or delay, having a daily capacity of about thirty thousand feet.

The machine is of the type of the Clyde Overhead Cableway Skidder, but is mounted upon steel skids instead of upon trucks. It has also a powerful extra drum for moving the machine, which is effected by making fast the moving cable to suitable anchorage ahead of the skidder and throwing in the clutch connecting this drum with the engine. In this way the machine is dragged up to an elevation sufficient to make possible these immense spans. The main cable is 1½-in. and is giving perfect satisfaction.

At present the skidder is working from one end of a valley known as Coon Hollow, being located on an elevation at one end of the hollow while the cable extends down the hollow to the opposite mountainside nearly a mile away. Logs are being skidded from both banks of the hollow.

Six guys are used, all being of 1 in. cable, two of which are wound on steam-driven drums and run from the peak of the boom back to the rear of the machine. Another guy runs out directly in front of the machine, and the remaining three are used to balance the pull of the main cable. These last four guys are all tightened by means of the skidding cable. The machine has eight drums in all, every operation being self-contained and under power.

The main cable itself is wound up, under steam, on a special drum contained on the bed of the machine and is not separate as in all other types of cableway skidders. This enables the operator to wind off only as much cable as will be required, the balance being stored on the drum out of the way.

Coal is conveyed to the machine by means of the skidding line (which runs through the buggy on the main cable) being lowered down into the valley where the buckets of fuel are made fast to it, raised and skidded in direct to the machine.

Those interested can obtain further information from the manufacturers, the Clyde Iron Works of Duluth, Minn.

Atkins Pioneers Hold Annual Banquet

E. C. Atkins & Company, Inc., Indiana, Ind., recently held their annual banquet of the "Atkins' Pioneers." This organization is made up of employees who have been associated with the Atkins Company for over twenty years. Twenty-five years ago the entire pay roll of the Atkins plant numbered about 200, and of this staff, 117 are still connected with the company. It is also interesting to note that among the members of the "Atkins' Pioneers," there are six new members who have been with the company for twenty years; 46 members who have been with the company between twenty-one and twenty-five years; 37 members who have been with the company between twenty-six and thirty years; 21 members who have been with the company between thirty-one and thirty-five years; 3 who have been with the company between thirty-six and forty years; 3 who have been with the company between forty-one and forty-five years and one, Mr. John H. Wilde, Dean of the Pioneers, who has forty-nine years' of service to his credit.

Disston Salesmen Hold Convention

Henry Disston & Sons, Inc., Philadelphia, Pa., held their semi-annual convention of eastern salesmen at their factory recently. The purpose of these meetings is to acquaint the men, who handle Disston goods, more intimately, with the methods of manufacture and also to get them better acquainted with one another. The attendance at the convention was large and the members are very enthusiastic over their work. New goods were shown and demonstrated and the superinten-

dents of the various departments gave the salesmen valuable information in regard to their manufacture. The salesmen also made frequent trips through the factory to see the actual production of their goods. Meetings held daily during the course of a week were addressed by various sepackers, including members of the sales force. The convention was a great success and enabled the salesmen to go out upon their duties once more, with even greater confidence than formerly, in the value of the goods which they handle.

A Fine Planer and Matcher Booklet

The accompanying illustration is a reproduction of a very handsome cover design used by the American Wood Working Machinery Company, in connection with an attractive and extensively illustrated booklet recently published, describing their model 5 American seventy-seven planer and matcher. Apparently, the company have set themselves in their publishing department a standard equally as high

as that which they have reached in connection with the woodworking machinery. The booklet, by means of its descriptions and illustrations must convince any interested reader that it will be to his own decided advantage to investigate this planer and matcher before making a selection.

With the advent of the Kettle River Railway through the Hope mountains, there will be rendered accessible 32,000 acres of fir, cedar and hemlock in the Coquahalla watershed. Of this only 6,500 acres have been taken up by lease, the remainder still forming part of the timber held by the crown.

WHY you should install the

Mahony Blower

System in your Planing Mill

Fifty per cent. higher efficiency than any other on the market to-day, uses ⅓ less power, costs less to install, no cyclone required, eliminates back pressure on the fan.

I will undertake to increase the capacity of any system now installed 50 to 100% by the application of the Mahony Back Pressure valve on your fan, without using a scrap more of horse-power.

YOU NEED this apparatus in your plant

Write to-day for prices

A. Mahony, 512 Wellington West, Toronto

Educational Talks on Leather Belting.

What Constitutes Good Leather Belting

First—**LEATHER**, possessing in the highest degree possible the following characteristics :

Good driving surface, to enable the belt to operate under minimum tension.

Firmness, that the belt may remain straight, run true on the pulleys.
Pliability, that it may hug the pulley closely, securing a large arc of contact.

Little Stretch, that it will seldom need to be shortened. **Elasticity**, that it may easily take up and let go its load as it travels round the pulley.

Good tensile strength, that it may carry its load without breaking.
Resistance to external conditions, such as heat, moisture, chemicals, etc., that it may do its work in any place, at any time, enduringly.

Second—**CEMENT** of the highest quality.

The **cement must be powerful**, elastic and immune to all the destructive forces that leather itself is able to withstand. As a matter of fact, the cement, when properly applied, becomes to all intents and purposes a part of the leather itself.

Third—**WORKMANSHIP** and **INSPECTION**.

Careful and skillfull workmanship should go into every process of construction. **Rigid inspection** of each operation is absolutely essential.

In short, high-grade leather belting can be obtained only from leather properly tanned, curried and finished; and that leather properly cemented with a suitable cement, all involving careful construction and rigid inspection of every process.

Subject for next month :—“ *Progress Made in the Manufacture of Belting* ”

Graton & Knight Manufacturing Co.

Oak Leather Tanners and Belt Makers

OPPORTUNITIES

WE own and offer for sale on attractive terms a few especially well selected tracts of timber running from 50 million to one billion feet that are ready for immediate operation, having a good local demand at high prices.

The timber on the Pacific Coast is the last stand of the great forests. Well selected timber in British Columbia is the best investment on this Continent and offers especially attractive inducements for manufacturers.

Veneer Machinery

THE "MERIT" LINE of Veneer Cutting, Dimensioning and Drying Machinery is designed first, for veneer mills cutting high grade furniture and commercial veneer from expensive timber, and second, for basket, crate, box and barrel factories using cheaper veneer cut from the less expensive woods.

Merit Veneer Lathe

In addition to Lathes, Clippers, and Driers, the line, includes Knife Grinders, Log Hoists and Trolleys, a set of Crate Head Machinery, a set of Barrel and Basket Hoop Machinery, Basket and Hamper Bottom Rounders, Nailing Forms, etc.

EDGINGS

Ontario

The sawmill at Lakefield, Ont., owned by John McGrath, 697 Harvey street, Peterboro, Ont., was recently destroyed by fire.

It is reported that an agreement has been reached with the Ontario Government which will enable the Backus Interests to proceed with the erection of a pulp mill at Kenora, Ont.

The sash and door factory and sawmill owned by J. R. McLaurin, Jr., at Vankleek Hill, Ont., was recently destroyed by fire. The loss amounted to \$8,000 and the insurance to \$3,000.

Mr. J. J. McFadden, Renfrew, Ont., has purchased the White Pine Lumber Company's limits in the township of Gough, Ont., and their logging outfit at Webbwood, Ont. He has put in two camps upon the limits this winter and the logs will be taken to his mill at Spragge.

J. R. Eaton & Sons, Orillia, Ont., are considering plans for the erection of a new planing mill. They have asked the town council to grant them a site and make them a loan. If satisfactory arrangements can be made a by-law will be submitted to the ratepayers at an early date. The proposed building will be 296 ft. x 150 ft., in addition to which there will be engine rooms, dry kiln and offices.

Chas. Pedwell, Lions Head, Ont., whose mill was destroyed by fire last fall, has purchased the circular mill formerly belonging to E. M. Miers, Wiarton, Ont., and will cut stock there during the coming summer. The mill has a capacity of 20,000 feet of one inch maple per day. It has steam feed and Mr. Pedwell intends to install a steam nigger and loader. Mr. E. M. Miers will continue in charge of the mill.

The Sudbury, Kewawa & Bell River Railway Company, whose chief incorporator is Mr. John Lumsden, of Ottawa, is seeking to obtain incorporation at Ottawa. It will serve the timber trade in the district through which it will run and provide a facility much appreciated for the opening of new limits. The line is projected from near Sudbury, Ont., easterly to Kewawa Junction, Que., and thence northeasterly to Bell River, Que. Its head office will be in Ottawa.

A large pulp paper and lumbering business, to be conducted, is to be established at Yellow Falls, in the vicinity of the Transcontinental Railway, in a short time, according to a report from Cochrane, Ont. The capital behind the scheme is said to be largely English. The proposal is to erect a mill at Yellow Falls, fourteen miles south of the bridge which crosses the Mattagami River at Jacksonboro', and it is also proposed to do all the manufacturing of pulp, paper and lumber on the site, the freight charges being too high to send the raw material away.

The Wood-Mosaic Company, Inc., New Albany, Ind., report that they have given up, for the time being, their proposal for the erection of a plant at Stratford, Ont. The losses which they recently sustained by fire at Louisville and Albany were much more serious than at first supposed and have involved the spending of much more money in re-building operations than was expected. For this reason they will not be able to go ahead with the Canadian undertaking this year and report that it will probably be twelve months before they can consider the matter again.

The Welland Lumber Company, Limited, which was recently incorporated, with head office at Welland, Ont., and capital stock of \$100,000, has the following officers:—President and general manager, John W. Rounding; vice-president, Frank Edwards; secretary, E. Teusley; treasurer, George Tufts; director, George W. Hodgson. The company's charter authorizes them to carry on business as timber merchants, sawmill proprietors, etc., and to buy and sell and deal generally in timber and wood of all kinds, also in timber limits. The company have secured a site near the G. T. R. at Welland and will erect a modern sash and door factory thereon.

The Sutherland, Innes Company, Limited, Chatham, Ont., report that they are over-hauling the plant at Chatham which they recently purchased from W. M. Drader and are putting in some new machinery in the heading department and in the hoop department. They are also over-hauling the sawmill boilers and engine and making the plant a first-class one in every respect. They will manufacture a full line of staves, hoops, heading and heading liners. They have taken over Mr. Drader's contract to manufacture barrels for the T. H. Taylor Company, manufacturers of Beaver Flour. The company will thus be manufacturing flour barrels for both of the large flour mills in Chatham. They also advise us that there is no foundation for the report that they will build a plant at Corinth, Ont.

The John Carew Lumber Company, Limited, Lindsay, Ont., have made a number of important alterations to their plant, with the object of increasing their capacity. A new Diamond 5-foot horizontal resaw has been installed, together with new slashers and new lath machinery. The floor of the mill has been rearranged and it is expected that the capacity will be increased by adding extra boilers and another 110 h.p. Wheelock engine. A number of new live rolls and conveyors have also been installed. A new railway siding has been put in to improve the yard and increase the shipping facilities. The company's tugs "Arthur C" and "Charlie L" have also been overhauled. A new boiler of 225 pounds per square inch pressure is being installed in the "Arthur C." The company report that they expect the coming season to be one of the busiest that they have ever experienced.

The Abitibi Pulp and Paper Company have reorganized their finances with the object of completing the plant at Iroquois Falls. With the proceeds of \$3,500,000, securities sold to a Chicago house, the ground wood mill will be brought up to a capacity of 225 tons per day, and a sulphite mill of 60 tons capacity as well as a four machine news print mill will be constructed. A new company, with the name of the Abitibi Power and Paper Company, Limited, will be formed to take over the assets and liabilities, the capital being \$7,000,000, with first mortgage gold bonds and debenture stock of \$6,000,000. The plans for the paper and sulphite mills have been prepared by Mr. George F. Hardy, of New York, and contracts for construction and machinery

will be called for early in March. It is expected that the newspaper plant will be finished and in operation by the first of April, 1915.

Eastern Canada

W. & R. Walsh, Wellington street, Chatham, N.B., have nearly completed plans for the erection of a sash and door factory.

The estate of the late J. H. Redfern, Montreal, has been placed in the hands of a trust company and is being gradually liquidated in accordance with the terms of the will.

A small mill has just been completed at St. Amade, near Montebello, P.Q., by the Owens Lumber Company, Limited. The capacity is about 12,000 feet per day. The mill is turning out hardwoods, particularly birch.

E. Neale, of Chatham, N.B., who formerly represented the English firm, Frank Harrison & Company, has returned from England after making arrangements to represent several large British timber houses, and he will continue his shipments from the Miramichi.

The paper mill owned by the New Brunswick Paper Company, of Miller-ton, N.B., on the Miramichi, is reported to have reduced its staff and output. The explanation given is that the output of the kind of paper they produce was larger than the market could absorb.

The stock of pulpwood formerly belonging to the East Canada Power and Pulp Company, Limited, in liquidation, has been sold to the Donohue Company, Quebec, P.Q. The pulpwood is in the yard of the mill at Murray Bay and also uncut at the company's limits on the Murray river and its tributaries.

A despatch from Bryson, P.Q., states that Mr. Justice Weir has given judgment for R. Rainboth, civil engineer, against M. J. O'Brien, contractor, for \$500,000. The action related to timber limits, in which the court held that the plaintiff had large interests, but deducted his share of the \$42,000 for expenses in works and materials furnished by O'Brien.

The Papineauville Lumber Company, Limited, Papineauville, P.Q., are erecting a mill for the manufacture of cheese box veneers and cheese box headings. They are just completing the installation of the machinery, all of which is of Canadian production and they expect to start operations early in March. The hardwood logs necessary for the operation of the mill are now being taken out in the woods. The company expect to make a large quantity of veneers during the coming season. They will also be equipped to make cheese boxes for direct shipment to cheese factories. When completed the mill will be thoroughly up-to-date.

Mr. W. B. Blair, formerly connected with the lumber firm of the late Mr. J. H. Redfern, Montreal, has formed a partnership with Mr. Louis Rolland as wholesale lumber merchants, under the name of Blair & Rolland, with offices at Room 234 Coristine Building, Montreal. Mr. Rolland formerly carried on business as Louis Rolland & Company. The new firm will stock lines recently handled by Louis Rolland & Company. The pulpwood limits, controlled by Messrs. Blair & Rolland, situated on the Gaspé Coast, have been sold to an English firm, who intend to start operations immediately, having taken possession of all interests with the idea of exporting the pulpwood to the United States.

The new stave, heading and shingle mill recently erected by the Sydney Lumber Company, Limited, at Dalhousie, N.B., to replace the one they lost by fire last year, is very complete and up-to-date. The main building is 110 x 36 ft., the sides and roof being covered with asbestos and galvanized iron. The mill contains four stave bilge saws, two double stave jointers, two stave crozing machines, four shingle machines complete, two heading machines complete, one small rotary and one machine for making barb wire spools. The engine room is 20 x 30 ft. and contains one large Robb-Armstrong engine. Two large boilers are operated with brick furnaces having return draft. The plant also includes a large dry kiln. The Jacquet River Lumber Company are manufacturing boards, planks and deals for the Sydney Lumber Company at their long lumber mill on limits owned by the Sydney Lumber Company on the line of the I. N. Railway.

The timber flume which has been under construction recently on Robson Creek, B.C., for bringing timber down to the Little Slokan River, whence it will be run down to Mr. W. C. E. Koch's mill, has recently been completed at an expense of \$29,000. Six million feet of logs will be brought down the flume during the coming spring and summer. The construction of the flume was a matter of much difficulty as it involved blasting, piling in swamps, etc. The flume, which is V-shaped and about a mile and a quarter in length, has sides which, with the exception of the first 500 feet, are four feet in depth. The grade varies from one to seventeen per cent. The flume is constructed of the best class of cedar to be obtained. The timber on Mr. Koch's limits on the Little Slokan will take five years to clear and the land, when cleared, will be excellent for ranching purposes. Mr. Koch intends finally to put the land up for sale.

Western Canada

Tenders are being received by Percy S. Howard, assignee, 607 Dominion Trust Building, Vancouver, B.C., for the purchase of the mill buildings, machinery, logging plant and equipment of the Sunset Lumber Company, Limited, of Bradner, B.C.

The Vancouver Lumber Company, Limited, are considering plans for making alterations to their cedar mill at Roche Point, B.C. The intention is to install a large amount of new machinery. The president of the company is Mr. J. E. Tucker and the managing director is Mr. E. C. Knight.

The B. C. Sulphite & Fiber Company, which has a pulp mill on Howe Sound, B.C., has bought 1,070 acres of timber on Sutej Channel from the Government, and is to have the area cleared in three years. The holdings comprise 6,000,000 feet of hemlock, 2,000,000 feet of larch and 3,000,000 feet of cedar, the hemlock and larch bringing 10 cents a thousand, in addition to the royalty, and the cedar 25 cents a thousand. For 950 acres on Broughton Island, bought by the same company, 15 cents was paid for the hemlock and larch and 40 cents for the cedar, in addition to the royalty. The timber contents of this latter area are 9,000,000 feet of hemlock, 4,000,000 feet of larch and 1,500,000 feet of cedar.

Lumber Wanted

Already sawn or to be sawn

Cuts of 1" and 2" Hemlock
Cuts of 1" and 2" Spruce
5/8" Cull Spruce or Norway
5/8" Merchantable Spruce
5/8" Merchantable Basswood
1" Cull Elm
1" Dead Cull Birch
1" Merchantable Birch, 3 to 5 feet long

Write us at once, giving estimates of quantities, best cash prices f. o. b. cars, shipping points, and full particulars of above kinds or of any other lumber you may have to offer.

Brake Your Load and Save Your Horses

Besides avoiding accidents and eliminating sand hilling this braking device can greatly reduce your hauling costs. Larger loads may be handled and fewer men employed.

Our catalogue fully explains

Ryther & Pringle Co.

Carthage, N. Y.

Barienger Braking Device for letting heavy loads down steep hill and mountain roads. Saves horses and expense of sand hilling.

When You Overhaul Your Mill

THERE are wet places in every saw and pulp mill where nothing but the highest class belting can "make good." It is for those wet places that we recommend what most mill-men swear by—our

"ACME WATERPROOF" BELT

This belt is especially made for a rough and trying service. - It has less stretch than any other belt by 15 to 25 per cent.

When you are overhauling try a Goodhue "Acme Waterproof" belt. Other Goodhue belts are "Extra" and "Standard."

Prices and Particulars on Request.

A New Saw Sharpener

United States Patent For Sale

This new and adequate saw sharpener is designed to give a keen cutting edge to the saw teeth.

No part of the mechanism is interfered with by emery dust. Every provision is made to enable this machine to do its work, thoroughly, quickly and accurately.

The sharpener was invented in Canada by us and at present we are sole manufacturers. It is patented in Canada and the United States. The patent rights for the latter country are for sale. If you are interested write us for further particulars.

The Sun Never Sets on Disston Brand Goods

Once a similar phrase might have been applied to ancient Rome. Later it described the vastness of the widespread dominions of the British Empire. Today, it carries its full meaning as applied to Disston Products.

The mechanics and householders of the world know them. The great majority possess some Disston Saw or Tool. The fame of Disston Goods goes wherever civilization penetrates. Into the wilderness the explorer sometimes carries the handy Chain Saw. The lumberman clears the way for civilization with his Cross-cut Saw. The millman, with his Band and Circular Saws, converts the rough timber into commercial lumber. Then the carpenter arrives to use his Hand Saw in building habitations for the incoming settlers.

The various mechanical trades that follow, each find some Disston Saw, Tool or File to aid them. Even the surgeon who accompanies the settlers has his saws of delicate structure and special design from the Disston Works.

And so we find it—in new countries and old; in the United States, South America, or the faraway Chinese Republic. Wherever you go, you find that the name of Disston carries its message of quality and efficiency to all mechanical trades.

Knight Pony Lath Mill

This mill is built for use with a 10 to 15 horse power engine and as single mill only. It is specially suited to the requirements of thresher and saw mill men operating in small tracts of timber, as both husk and carriage are of a size which will permit of easy loading between the standards of a wagon when moving from one setting to another.

Write for the catalogue of the Knight line of saw mill machinery.

Size "S" Single Mill with 16-foot Carriage

Size Husk ... 3 feet by 6 feet 3 inches
Diameter and Length Mandrel . 2 3/16 by 55 inches
Size Drive Pulley ... 20 by 10 inches
Feed per Revolution of Saw ... 0 to 3 3/4 inches
Feed Belt ... 4-inch Gandy
Largest Diameter Saw ... 56 inches
Length of Carriages ... 12, 16, 20 or 24 feet

Width of Carriages ... 33 inches
Trucks ... 7-inch wheels and 1 1/4-inch axles
Length Track ... 32, 40, 48 or 56 feet
Style and Opening of Blocks ... C1-36 inches
Style Mill Dogs ... Pony Excelsior
Style Set Works ... No. 1 Single Ratchet

With each complete size "S" mill we furnish one saw wrench, cant hook, feed belt, pulley with boxes for tightener and foundation bolts for husk.

Griplock Riveted Chain Belt

Section of Griplock Riveted

No More Breakdowns—No More Delays

This is the slogan that users of **Griplock** Chain Belt have adopted. No hooks to be opened up, no breaking of chain belt in **Griplock**. **Griplock** is so constructed that it will withstand the severest kind of service. It is built by the Chain Belt Company, Milwaukee, Wis., a concern that fully understands the requirements of the Lumber and Saw Mill Trade.

We would be very glad to mail you sample links for your inspection.

Elevating, Conveying and Transmission of all kinds a specialty

What I Can Do For The General Planing Mill

You don't have long runs on a few kinds of patterns, the kind that requires a "333" — your work is mostly short runs, different kinds, different sizes, different patterns—the kind that need me. Here's what I can do for you:

1. I will take care of all your matching and sizing up to 24" x 8".
2. I will do all your double surfacing up to my full rated width.
3. I will run all the flooring you need.
4. I will serve you as an inside moulder carrying formed cutters up to 1 1/4" projection.
5. I am readily accessible in every part, so that changes can be made quickly, easily and economically.
6. I have all the conveniences, all the time-saving adjustments and all the grade-raising value of the latest fast-feed matchers.
7. I have a mechanically perfect drive that makes every ounce of power count.
8. I run at a low operating cost, both for power consumed and upkeep expense.
9. I am medium in weight and size.
10. I am also medium in price, so that any mill can afford to put me in.
11. I am making money—big money—for hundreds of successful planing mill owners, men who, like you, are operating a general purpose mill.
12. I will do the same thing for you.
13. I invite you to write today—now—to my designers and builders.

J. A. FAY & EGAN CO.

465-485 W. Front St., Cincinnati, Ohio, U. S. A.

The Steam Tension Band Mill

THE top guide on this mill, as well as the upper wheel, is operated by a steam cylinder.

This means that the guide can be moved up or down instantaneously, which in one day's work means quite a saving of time over the ordinary mill. This goes a long way towards paying for the mill by the end of a year.

But this is not all—with this steam operated guide it is just as easy to keep the guide close to the cut as it is to set it for certain size logs and keep it

there. This can be done without loss of time, and so by bringing the guide down close to the cut, vibration of the saw is done away with and the quality of the lumber is improved.

No form of tension yet devised is as easy on the saws as the steam tension—several of the users of this mill have run through an entire season without cracking a single saw.

These are some of the reasons why our steam tension band mill is the most economical mill to buy, and there are others which you will find in our catalogue.

When you are tuning up your mill this winter for next season's operations, remember that we can serve you promptly whatever your requirements may be.

Why Cling-Surface Treated Belts Pull Best

Taken verbatim from Robert Thurston Kent's article, "The Pulling Power of Slack Belts," from *Industrial Engineering*, May 1913 issue. This article was based upon experimental research with untreated and Cling-Surface-treated belts. Ask for complete copy of his report.

"The value of the treated belt apparently lies in the fact that the tension on the slack side of the belt so treated, may, owing to the greater coefficient of friction, be decreased to a much lower value than for the belt not so treated, before slip occurs. This decrease in the value is accompanied by an increase in the length of the belt, thereby giving it a greater arc of contact on the pulley. These two factors both tend to increase the pulling power of the treated belt over that of the untreated belt in an increasing ratio."

Cling-Surface and the direct and indirect economy improvements are now receiving more serious attention than ever from prominent scientists.

The photograph of Cling-Surface-treated-belts shown is but one of hundreds with accompanying data which we have to prove the lasting benefits.

Cling-Surface stops slipping, water-proofs, reduces friction, and permits belts and ropes to run easy or slack.

Tell us about your belts and ask for literature.

We quote f.o.b. Toronto.

AUTOMATIC FEED KNIFE GRINDER

Type "B," range from 54" to 130". Price—From \$220 to \$395.

This cut represents one type only of our line of automatic knife grinders. We make all sizes from a small \$65 bench grinder to a 130 in. machine.

We also manufacture a complete line of automatic

Saw Sharpeners

for both circular and band saws.

No millis complete without one or more of the Rogers-Buffalo Machines.

Send for our catalogue—it is free on request.

SAMUEL C. ROGERS & CO. 18 LOCK ST. BUFFALO, N. Y.

Dixon's Traction Belt Dressing

EVERY element needed to restore and maintain the "life" of a leather belt is contained in this paste dressing. It penetrates to every fibre of the belt, strengthening them and bringing back the pliability and vitality—and it puts on a surface of maximum pulling power. It water-proofs the belt, too, so much as any dressing can. Send for "The Proper Care of Belts," No. 238.

CLYDE IRON WORKS

Duluth, Minnesota, U.S.A.

Are your horses of use to you?

This seems an absurd question—and the answer is always
"Of course they are"—In which case provide your stables with:

Johnson's Reliable Veterinary Remedies

Johnson's Horse Liniment, No. 1 (Alcoholic)

1 gal. jugs (Imperial)	\$4.50 gal.
1 lb. bottles	8.00 doz.
2 lb. bottles	15.00 doz.

Johnson's Horse Liniment, No. 2 (an oil liniment)

1 gal. jugs (Imperial)	3.00 gal.
1 lb. bottles	6.00 doz.
2 lb. bottles	11.00 doz.

Johnson's Horse Colic Remedy

A sure and speedy cure for all kinds of Colic	
1 gal. jugs (Imperial) 40 doses	5.00 gal.
1 lb. bottles 4 doses	8.00 doz.
2 lb. bottles 8 doses	15.00 doz.

Johnson's Veterinary Healing Ointment (Gall Cure)

2 lb. tins	2.00 per tin
4 oz. tins	3.50 doz.

Johnson's Condition Powders (Concentrated)

1 lb. Packages	3.60 per doz.
----------------	---------------

Johnson's Camp and Household Remedies, such as Cough Syrup, Healing Ointment, Headache Powders, Big 4 Liniment, Stomach Bitters, Cathartic Pills, etc., etc., have stood the test of twenty-five years and are in use all over Canada, from the Atlantic to the Pacific. Prices are lower than those of all other manufacturers. Letter orders receive prompt attention.

A. H. Johnson, Wholesale Druggist, Collingwood, Ont.

Are Your Horses in Good Condition?

Horses for all lumber work are subjected to the hardest hauling under the most severe conditions. They should therefore be as fit as all possible care and attention can make them.

**In the Lumber Camp,
Around the Mill, In the Yard**

and wherever lumber has to be hauled the horses are always liable to a multitude of small injuries which if not attended to promptly may develop into lameness or disfigurement, thus reducing the working capacity of the horse and impairing its value from a sale standpoint.

You should always have handy and ready for use

Good Liniment

to reduce bruises, strains, soreness; allay pain and inflammation quickly, be an antiseptic dressing to a cut or burn, or to heal a wire cut, wound or laceration.

ABSORBINE

is an antiseptic healing preparation as well as a resolvent and a discutient. It will assist nature in bringing about a dissolution of the bunch, restore the circulation, gradually restoring the part to its normal condition.

It will produce permanent and complete results without blistering or removing the hair, and will leave no blemish. You can work the horse at the same time.

All enquiries on special cases answered without delay—full information and instruction on request. Absorbine \$2.00 per bottle at dealers or express prepaid. Manufactured only by

W. F. Young P. D. F.
424 Lymans Bldg. -- MONTREAL, CANADA

Annihilate Scale

Potato Scale will positively remove scale from your boiler tubes and can do no injury to your pipes or fittings. Feed water should be regularly treated with Potato Scale to prevent scale, pitting, grooving and honeycombing; it saves fuel and so treats the water that it absorbs more steam.

Send us a gallon of feed water which we will analyze and then mix a sample of potato scale to suit your conditions—this is a free trial, write us.

LOCATED

Just the tract of timber YOU, a manufacturer of lumber, need.

Just the tract of timber that will prove a desirable and profitable investment for capital now idle.

Buy it NOW.

Provide today for your future timber needs, for your future profits.

Buy a natural resource the supply of which is decreasing almost to the extent of the quantity used annually; the demand for which is increasing at home and abroad.

No other continent has such a wonderful and valuable array of timber as North America. Our woods are the most durable, the most beautiful, the easiest to work. Therefore they are the most valuable and our forest products are in demand wherever wood is used.

Today you are afforded opportunity to profit by the logic of this situation.

Send for copy of "Lumber User's Guide No. 8," which treats of the Special Values, Special Adaptabilities and Special Economies of Douglas Fir for all building purposes.

Logging Locomotives

Mikado Type Locomotive, Polson Logging Co.

The Mikado is a good type for heavy hauling, where runs are fairly long and high steaming capacity is needed. The locomotive illustrated traverses 30 degree curves, and can be used on rails weighing 45-50 pounds per yard. It is simple in construction, strongly built, and rides well on uneven tracks.

When in need of a logging locomotive, consult

The Baldwin Locomotive Works

Philadelphia, Pa., U. S. A.

**A Reliable Engine in the Woods**

In logging operations the scene of activity is often many miles from repair facilities so the wise lumberman will appreciate the importance of a reliable locomotive. Our locomotives are built with this fact in view. They are sturdily and simply constructed and will give continual service all year round.

Logging and industrial locomotives are a specialty with us. We are prepared to construct any special types or submit specifications.

If you are in the market we will be pleased to hear from you.

We are also builders of stationary boilers, suitable for contractors and industrial plants.

Canadian Locomotive Company, Limited, Kingston

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

December 20th, 1912.

The Pioneers

We alone manufacture the Genuine "DUNBAR" Shingle Machines—other machines advertised as such are imitations.

Operating our "Dunbar" Shingle Machine one man will joint and sort from 16 to 45 thousand shingles in a day of 10 hours. Good shingles too.

We are Canada's Pioneer Shingle Machine Manufacturers, and we respectfully solicit correspondence from lumber manufacturers.

The Smith Foundry Co., Ltd.

Successors to McFarlane, Thompson & Anderson Mfg. Co.

Fredericton, N. B.

"Dunbar" Shingle Mill

THIS mill is acknowledged the most complete and satisfactory shingle mill on the market. It has a capacity of from 15000 to 45000 per day according to the quality of the lumber.

Our literature contains full particulars.

This Mill Is Just As Good As It Looks

THE Campbell Lumber Company of Weymouth Bridge, N. S. have been using a Pony Mill like this since 1906. Some little while ago we wrote them to ask how they liked it. Here is their letter :—

"In reference to our Pony Bandmill we have cut over 500,000 ft. of hardwood logs with our Bandsaw and have found it entirely satisfactory."

"We have also sawn a great deal of hard, frozen wood in the winter time, which we are pleased to state has been a great success, and if the saws are properly taken care of, there is no trouble in cutting the above stock with a Pony Band mill such as you have sold us."

If you are cutting small logs, you need a mill—like this.

The Waterous 6 ft. Pony Mill

carries out the promise of its appearance in the work it does. It is a sturdy, compact, well-balanced mill in which every part is built to turn out good, well sawn lumber. It is a nice mill to handle.

Built as single or double cutting, it will take saws up to 8" wide, has a clear cutting space of 36" and a falling down space 30" wide.

There are a lot of these Waterous Pony Bandmills in use in Canada at the present time. If you are interested in what other users say of the mill let us send you an address of an installation in your neighborhood.

Details and specifications on request.

GREAT STRENGTH AND DURABILITY

Dick's Balata Belting, the best known fabric belt in the world, is specially distinguished for great strength and durability. Most gratifying results have been obtained from Dick's Belts as regards retention of strength. There are cases on record where Dick's Belts have been running for over twelve years and not only have retained their strength, but show not the slightest signs of wear and tear.

Write for Catalog on "Transmission Appliances."

THE BELT YOU WILL EVENTUALLY USE

BECAUSE—It withstands heat, cold, damp, wet and chemical fumes.
BECAUSE—It is uniform in thickness and runs true.
BECAUSE—Of its great strength, almost twice that of oak-tanned double leather.
BECAUSE—It costs no more, all things considered.

THE LEADING STOCK LINES

Our New Catalogues for 1914
Will be sent upon request. Write for Discounts.

WE ANNOUNCE THE FIR DOOR

This door, lately introduced from the West, is justly popular because of its adaptability for a variety of oil finishes. It matches Georgia pine trim perfectly, and can be stained to match various hardwoods, Chestnut, Oak, Ash, etc.

We believe that the Fir Door is going to be "The Door." In line with our policy of Progress, we manufacture it, and are the first Eastern firm to do so. We lead,—watch the others follow us.

This places the Fir Door within reach of all consumers in the East, as we carry a large stock in fourteen different stock sizes, and can make odd sizes for prompt delivery at short notice. Our new Door Catalogue gives full particulars.

"Bargain Day at the Shook Mills"

On Monday March 30th, 1914

We will accept orders for a large stock of goods which must be sold to make room for our 1914 designs. This consists of discarded stock designs, over-runs, and a few unfits and cripples.

Doors, Sash, Mouldings and Miscellaneous Millwork

An equal chance for all, and a large stock to choose from. Write for complete information, and remember the date

ONTARIO

Canada's Banner Province

Ontario's timber production last year valued at \$26,774,937 or 40% of Canada's total output.

Pine production,	354,260,008 ft. B.M.
Pulpwood,	131,434 cords.
Railway Ties,	5,704,459.

Ontario's woodworking industries, using 34 different kinds of wood, provide a ready market for the lumberman. Eighty-two per cent. of lumber used in Ontario's industries purchased within the Province.

Ontario's vast resources offer unsurpassed opportunities to the lumberman.

Our Double Band Mill, Huttig, Ark.

Why We Can Give "Value Received"

We Own one hundred thousand acres of the best virgin Southern Hardwood timber.

We Operate large band mills at Huttig, Ark., and Deering, Mo.

We Cut Forty Million feet of hardwoods annually and carry 15,000,000 feet in stock.

We Sell only stock cut on our own mills and so can **GUARANTEE** the quality of every shipment.

We Ship high grades that increase the size and percentage of your cuttings, reduce factory costs and shrink the waste pile. Therefore:

We Can save you money on every shipment of oak, ash, gum, elm, cypress, tupelo, hickory, cottonwood, sycamore, soft maple and dimension.

Let us prove this on your next order.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 16-ft. Slash table. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 2 Lath Trimming Saws. | |

POWER PLANT

- | |
|---|
| 1 24 x 36 Slide Valve Engine with 40-in. x 12-ft. extra heavy double arm split fly wheel. |
| 2 Double Duplex, high pressure Water Pumps. |
| 5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam. |
| 2 125 h.p. Water Wheels. |
| 1 Upright Engine for sawdust conveyor. |
| 1 10 h.p. Engine. |
| 1 Mitts & Merrell Hog. |
| 1 Wood Machine for 22-in. wood. |
| 1 Wood Machine for 16-in. wood. |
| 1 Edger for ripping dry lumber, installed. |
| 1 Edger for ripping dry lumber, not installed. |
| 1 30 h.p. Generator, 250 volt. |
| 1 30 light arc generator. |

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and rails and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

FILING ROOM

- | |
|--|
| 1 Automatic Filing Machine for 12-in. D.C. band saws. |
| 1 Automatic Grinding Machine for 8-in. S.C. band saws. |

Solid and Inserted Tooth Circular Saws

We make a specialty of these lines

We remake old Solid Tooth Saws
into new Inserted Tooth Saws

Write to us for quotations.

Our saws have been before the public of Canada since 1855, and have won a reputation far excelling any other make of saws, combining as they do so many points of marked superiority.

By the old method the tempering of circular saws was to a great extent a matter of chance.

By our Patent Process that uncertainty is entirely avoided.

Being tempered and straightened by heat and pressure in air-tight ovens at a uniform heat between heavy revolving plates, we produce a perfectly even temper throughout the plate, and being free from that uneven strain or tension caused by so much unequal hammering they are not so liable to buckle, which was a great source of trouble and expense in the old style of saw.

These saws will stand up to their work better under all circumstances, and being made of a higher quality steel than it is practical to use by the old method, they hold an edge longer and will do more work than any other saw on the market.

We are prepared to make prompt deliveries of all Saw Orders—Rush Orders by mail or wire receive immediate attention.

The Steam Tension Band Mill

THE top guide on this mill, as well as the upper wheel, is operated by a steam cylinder.

This means that the guide can be moved up or down instantaneously, which in one day's work means quite a saving of time over the ordinary mill. This goes a long way towards paying for the mill by the end of a year.

But this is not all—with this steam operated guide it is just as easy to keep the guide close to the cut as it is to set it for certain size logs and keep it

there. This can be done without loss of time, and so by bringing the guide down close to the cut, vibration of the saw is done away with and the quality of the lumber is improved.

No form of tension yet devised is as easy on the saws as the steam tension—several of the users of this mill have run through an entire season without cracking a single saw.

These are some of the reasons why our steam tension band mill is the most economical mill to buy, and there are others which you will find in our catalogue.

When you are tuning up your mill this winter for next season's operations, remember that we can serve you promptly whatever your requirements may be.

Canada, United States and Great Britain, \$2.00 per year in advance; other foreign countries embraced in the General Postal Union, \$3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

The Mississaga Timber Problem

The problem presented by the timber which was blown down in the Mississaga Reserve, in Northern Ontario, last fall is one which calls urgently for solution, if the province is to save the valuable timber already down and reduce the risk of fire sweeping through the reserve and destroying one of the most valuable stands of white pine now remaining on the face of the globe. Attention has been called to the situation already in these columns, and we believe that the government has done what it considered best under the existing conditions, but unfortunately, the efforts of the government do not yet give evidence of bringing about satisfactory results. A sale was recently advertised of some of this timber, in the hope that by having it removed the government would realize its value and reduce the fire risk. But the offers were so small that no sale resulted and the question still remains to be solved. We would draw the attention of our readers and especially the attention of the government to the letter published elsewhere in this issue, written by a resident of Thessalon, Ont., who is in close touch with the situation and whose opinion is representative of the opinion of those in the district who are in a position to appreciate the circumstances.

The writer of this letter, Mr. J. B. Dobie, estimates that the timber is worth \$7,000,000 at least, and that the government could build a railroad into the reserve for \$500,000, thus giving the district the advantage of a railroad and also saving the timber. The case which Mr. Dobie makes out appears so reasonable, that the government ought to give it immediate attention and to announce its plans, one way or the other. From the information furnished by Mr. Dobie, it appears highly probable that the building of a railroad would open a district, not only of great timber resources, but one rich in minerals, which may be expected to create traffic and assist the railroad in paying for itself from the start. Mr. Dobie believes that the recent failure of the government to secure satisfactory offers for the timber, was

the result largely, of the absence of railroad facilities for taking in supplies to the camps which would be established in the reserve. With this handicap removed, he asserts that the government would be able to obtain bids for the timber which would represent, by the increased value, the total cost of the railway. Moreover, he believes, that it is quite feasible to build such a road and have it ready for operation by next fall. These statements make out an exceptionally strong case and lumbermen in Ontario would like to see the government act upon it without delay.

In a nutshell, Mr. Dobie's case is simply this: the timber is there; it is very valuable; a large portion of it is on the ground, in danger of destruction and causing great fire risk; the district needs a railroad and gives fair promise of supporting one through its extensive timber and mineral wealth. Previous to the storm of last fall, the government was well-advised in holding this timber for future operations, but to-day the situation is completely altered.

The Trade Journal and the Trade Association

There is a remarkable similarity between the mission of a trade journal and that of a trade association as evidenced in such conventions as that which was held recently at Buffalo, by the National Wholesale Lumber Dealers' Association, which is reported elsewhere in this issue. First of all, we wish to impress our readers with the importance of the convention referred to from several points of view, and then to say a little about the trade journal and its work. This convention at Buffalo was the outgrowth of the association spirit as developed and brought into effective existence by a great body of wholesale lumber dealers in the United States and a number of them in Canada. Its foundation is based upon the fact that "in union there is strength." Its activities are wide-spread and of great value. It promotes good fellowship among the members of the trade. It enables them to avoid many of the troubles and losses which are so difficult to avoid without co-operation. In a word, it is a "clearing house" for trade problems, and by its means, the course of trade is simplified to a wonderful extent.

Having laid its foundations upon the principles of good fellowship, it is not surprising that the association should have extended its boundaries so as to take in its fellow-traders in Canada. Nor was it surprising that, in the course of time, the feeling of international goodwill thus engendered should have resulted in the appearance of a member from Canada, upon whom the choice of the association should fall, as a fitting man to occupy the important position of president. Circumstances have worked naturally towards this end and Canadian lumbermen will feel that they have been personally complimented by this generous conferring upon one of them, of one of the greatest honors in the gift of the National Wholesale Lumber Dealers' Association.

The growth of this association and its great increase in usefulness leads to the second suggestion made at the beginning of this article; that the trade journal has in some respects a field of usefulness quite similar to that of the trade association. To point the way out of difficulties, to bring about a feeling of good fellowship among members of the trade and to increase the opportunities for trade for its readers, are among the chief objects of a trade journal, just as they are for a trade association. Perhaps these facts could not be more clearly or more interestingly put forward than in an article, also appearing in this issue, by a contributor who has been doing his share through a series of articles to assist our readers in British Columbia in their trade troubles. The last of this series of articles, written by one who, on account of his modesty prefers to be known under the pseudonym of "Douglas Fir," deals with the trade journal and its readers. Caustic and critical as this article and its predecessors have been in their references to lumbermen in western Canada and their business methods, the criticisms have been tempered with good nature and probably have sunk in deeper on that account. They should be read and analyzed carefully, as they contain many homely and important truths which will repay minute study.

National Wholesalers Annual Meeting

Matters of Much Importance Dealt With—An International Love Feast—Gordon C. Edwards, of Ottawa, Elected President—Reports of Year's Business

The twenty-second annual meeting of the National Wholesale Lumber Dealers' Association, which was held at Buffalo on March 4th and 5th, although one of the most successful business meetings ever held by the Association, developed early upon the first day into a remarkable international love feast, which had its fitting climax on the afternoon of the second day when Mr. Gordon C. Edwards, of Ottawa, Ont., the former vice-president of the Association, was borne into the convention hall upon the shoulders of his friends, to accept the honor of having been elected to act as president of the Association during the year 1914.

The business sessions of the meeting were characterized by that snap and vigor which have always been present at these meetings, and the result was that a very long and important business bill-of-fare was dealt with expeditiously and effectively. The attendance at the convention was very large, members being present from all parts of the United States, and many parts of Canada. The president, Mr. N. H. Walcott, Providence, R.I., occupied the chair and called the meeting to order at 10.30 a.m., on Wednesday, March 4th. From then on, until about 4 p.m., on Thursday, March 5th, the business affairs of the convention were put through in rapid order.

After the preliminary matters had been attended to, the president delivered his annual address, in which he referred briefly to the work of the year, which had been a very trying one. The various departments of the Association had increased in usefulness, especially the Bureau of Information, the Legal Department and the Transportation Bureau. Through these departments, they had been able to save many thousands of dollars for their members during the year and he believed that any wholesale lumber dealer, who was not a member of the Association, would immediately become a member, if he could see the work done by the executive committee and Board of Trustees. In looking about for some means of increasing the usefulness of the Association, the president had come to the conclusion that the large number of lumbermen's clubs throughout the country ought to be brought together under the leadership of some such body as the National Wholesalers, who could represent them in all questions relating to the lumber industry and trade.

The Secretary's Report

The secretary, Mr. E. F. Perry, in his annual report stated that the past year had been one of greater activity than any year since he had been appointed secretary. This had been caused undoubtedly by the seeming unrest and uncertainties in the business world, and more especially by the unusually marked inconsistencies of business, which he believed had been brought about by unnatural causes. The lumber business was an erratic one and responded to changing conditions, seemingly without much regard to scientific reasons, and consequently, was slow to readjust itself.

Among the subjects referred to by the secretary was that of "terms of sale." This matter had engaged much of the attention of the Association during the year. Experience seemed to indicate, beyond any possible question, that lumbermen were becoming more and more convinced of the importance of having sales contracts include technical terms of settlement and realize more than ever the fact that the terms and results of settlement had a serious effect upon profits.

The report of the superintendent of the Bureau of Information stated that the results of the year's work had shown more closely than ever before the worth of the Bureau as a specialist in lumber credits. It had revised on an average 35 reports daily. In order to do this, at

least 13,000 requests for statements of assets and liabilities had been made, and approximately 22,000 special enquiries were made of lumbermen outside of the Association. Over 26,000 names had been placed on the Association's tracers and 48,000 special enquiries had been sent to members. Not included in this were hundreds of special letters required in investigating in a manner different from the formal enquiry. An examination of the reports showed a larger percentage of statements of assets and liabilities than formerly. A hard process of education was bringing many a retailer to the point where he would find it to his advantage to give complete information. If the Association could insist upon each subscriber furnishing a list of his customers, it would do so, because of the great value of such information. During the past year, 73 new lists had been sent in, and many instances could be pointed out in which they had saved a doubtful or back account.

The year had been started with claims on hand amounting to \$260,000. New claims had been received amounting to \$272,000. Statements and adjustments had been made to the extent of \$300,000, leaving in the course of settlement \$232,000. "No man's Judgment is infallible," said the report, "and if you find an account reaches the point where it requires action, we believe, the Bureau offers the best possible facilities for collection. Numerous instances could be specified where the Association obtained results when others failed to do so, and this is not accomplished because of any particular trick or system, but for the simple reason that our demands for payment are backed by an organization prestige which the unscrupulous debtor fears, and knows he must respect if he would continue in business.

"An ordinary attorney cannot give you this benefit. He can dun or sue, but many accounts are collected more expeditiously by moral suasion than through the courts, and our experience shows a much larger percentage of collection through the Association by demands and careful handling of each individual case, than through attorneys."

Overproduction and Restricted Credit

The Committee on Trade Resolutions presented an interesting report, in the course of which the following reference was made to trade conditions:—"Our trade is suffering, with all lines, in the country, from the tremendous liquidation we are passing through. The overhead expense of many firms is eating into their surpluses, and in many cases lumber is being made and sold at prices which admit of no profit, a proceeding which is, if it is anything, a disgrace to business enterprise and intelligence. The ambition of some of our larger institutions to indefinitely increase their output has brought some disasters. One north-western lumber magnate confessed that they were trying to run three mills where two would produce all the lumber they had been able to sell. Over-production and uncalled for development of all kinds have been carried to such a degree that great demands have been made and banks have given unusual loans. There is a shortage of money the world over and we cannot hope for better conditions, until (in a sound manner) credit takes the place of cash."

"You may be able to see in your own observation of trade conditions," said the report, "and in the information which the Association has disseminated among its members, that there is need of closer co-operation of the manufacturer, wholesaler, retailer and the wholesale consumer, to the end that unfair practices and discrimination be eliminated by mutual consent, and a better basis of business established by a universally distributed acknowledgement of the benefits of strictly enforced principles.

"The administration of some phases of the lumber business is

Group showing some of those attending National Wholesalers' Convention at Buffalo, at which Gordon C. Edwards, of Ottawa, Ont., was elected President for 1914.

carried on with only a partial improvement over what it was 50 years ago. In fact, in some sections and some lines there has been no change. This has resulted in stocking lumber from habit instead of accurate facts and prospects. It seems to me that under the auspices of our organization a monthly bulletin could be sent to our own members and the secretaries of similar organizations, in which significant and important reports could be placed in the hands of those who need them. It has become a custom for secretaries of Chambers of Commerce and Board of Trade to keep in touch with other secretaries by correspondence or meetings so that any improvement or economic principle may have the widest and quickest application possible. This co-operation is simply adding to the strength of the fabric of which we are all a part, and every factor of strength in the field we work in, adds to the possibility of our own success. Properly carried out, and the points intelligently selected, a great deal can be done along this line with but little cost.

"The lumber business, like all others, is in a state of transition. Organization is simply an element of business. Its tendency is, not to take the place of individual effort, but to protect the fruits of such effort. Co-operation does not offer anything in the way of artificial props, but simply insures harmony among factors related to each other, whether in close proximity or not. Association has the function of encouraging individual effort and not discouraging it, and it is especially needful in this period of adjustment, that each one look well to his own affairs and as far as possible increase his own independence and thus make himself a dependable support to the new structure which we are inevitably forming."

Railway and Transportation Report

The report of the traffic manager contained a great deal of detailed information regarding the important work carried on by the Railroad and Transportation Committee during the past year. The disputed railroad claims handled during the year numbered 857 and involved sums amounting to \$17,683. Collection had been effected in connection with 346 claims, totalling \$7,036. Claims to the number of 382 remained unsettled on March 1st, 1914. They involved \$7,688. The report dealt in detail with a large number of important transportation questions which had come up for consideration during the year, and in connection with which the interests of the Association had been carefully represented and watched over.

A number of other reports were presented dealing with matters of interest to members of the Association and were dealt with in routine manner, becoming accepted and adopted. They will all appear in the printed report of the annual meeting.

An interesting discussion took place in connection with a proposal made by one member that the Association should support the railroad companies in their application for a general increase of 5 per cent. in the rates which they are permitted to charge for carrying freight. The object of the proposal to support this application was to enable the railway companies to make a profit consistent with the increased cost of operation. It was felt by those who supported the proposal, that an early decision by the Interstate Commerce Commission upon this point, in favor of the railroads, would enable the latter to go into the market again as extensive consumers of lumber and would place them upon a far more certain financial foundation.

Considerable criticism of this proposal was presented by other members, some claiming that high freight rates were already preventing them from conducting their logging operations in such a manner as to prevent leaving valuable timber in the woods. A suggestion was also made that it would be more fitting for the railway companies to squeeze a good deal of water out of their stocks before being permitted to increase their freight rates. The result of the discussion was that the question was submitted to the committee on resolutions, who brought in a resolution urging an early decision by the Interstate Commerce Commission upon this point, but not committing the Association to an expression of opinion as to the advisability of the advance of 5 per cent.

The Resolution Committee also brought in resolutions supporting the Forest Products Exposition; favoring a tax upon the yield of timber instead of on the land; and opposing any charge by the railway companies for placing and removing cars upon private tracks.

Election of President

During the convention session on Thursday, March 5th, the president, Mr. N. H. Walcott, introduced the proceedings which resulted in the selection of Mr. Gordon C. Edwards, of Ottawa, as president for the ensuing year. It was customary, he said, to call for an expression and opinion from those present as to who should be appointed president, and that the matter should then be left with the Board of Trustees. He then called for an expression of opinion upon this subject.

Mr. F. R. Babcock, Pittsburgh, Pa., after a few introductory remarks, said that the man who seemed to occupy their consideration this year as the most fitting member to be selected for president was

one who embodied all its necessary qualifications. He had been for ten years or more a member of the Board of Trustees and had been most efficient in every manner in connection with his efforts on behalf of the Association. He had attended every meeting of the trustees, and when he was on the executive committee had allowed nothing to interfere with his obligations in connection with the Association. He was a man of rare ability, who had the interests of the Association at heart at all times. Furthermore, he came from their sister country—Canada—so that his appointment as president would assist in establishing the Association as one of international scope. It gave him a great deal of pleasure to recommend that Mr. Gordon C. Edwards, of Ottawa, be their president for the year 1914.

Mr. C. H. Prescott, Jr., Cleveland, Ohio, seconded the motion and stated that he had known Mr. Edwards from the time of his earliest connection with the Association. He had always been loyal and capable, and was able, in every way, to represent the Association properly.

Mr. Gordon C. Edwards in replying to the retiring president's announcement that he had been honored with the position of president for the present year, expressed his deep appreciation of this honor. He felt sure that the honor was one which would be greatly appreciated by all his Canadian brethren in the lumber trade.

New Trustees Appointed

The Committee of Nominations reported the following members as their recommendations for the vacancies upon the Board of Trustees:—W. W. Knight, Indianapolis, Ind.; M. E. Preisch, North Tonawanda, N.Y.; B. J. Betts, Philadelphia, Pa.; Alex. Wilson, Pittsburgh, Pa.; C. F. Treadway, New Haven, Conn.; A. L. Stone, Cleveland, Ohio, and C. H. Hershey, Newark, N.J.

In the evening of Wednesday, March 4th, an excellent smoking concert was given by the Buffalo and Tonawanda lumbermen. Splendid talent had been engaged and the event was most enjoyable. A musical entertainment for the ladies was also given on Wednesday evening.

A Splendid Banquet

On Thursday evening, March 5th, a banquet was held at the Iroquois Hotel, at which there was a very large attendance. The banquet was remarkable for the enthusiasm of all present and the jovial manner in which they entered into the musical proceedings. Many specially prepared songs were sung, practically all present taking part. For this purpose a programme of the songs containing the words had been distributed at the commencement of the banquet. A large number of ladies were present at the banquet and added greatly to the pleasure of the evening. The toast list was arranged with much skill. It included three excellent speakers and the toast master, John Archdeacon Murphy. The first was by Hon. Thos. Upton Sisson, Congressman for the 4th Mississippi district, whose address was entitled "Shall We Mortgage Posterity." The address was an excellent one in which the speaker denounced the present day policy of increasing war expenditures. These would saddle upon posterity, a debt which they could not pay and which the present generation had no right to impose upon them. It would be impossible to do justice to this address in any other manner than by a verbatim report.

Hon. Rodolphe Lemieux, ex-Postmaster General of Canada, was the second speaker and he delivered a most eloquent and inspiring address upon Canada. The final address was delivered by Mr. Edward F. Trefz, field secretary of the Chamber of Commerce of the United States, who explained in a speech of great force and conviction, the work of the Chamber of Commerce.

Senator W. C. Edwards, of Ottawa, Ont., was one of the guests at the table of honor at the banquet and spoke briefly when called upon, expressing the pride he felt in the selection of his nephew, Mr. Gordon C. Edwards, as president of the Association.

The greatest commendation is due to those who had in charge the preparation of the details in connection with the banquet. The menu for the banquet was inserted in an attractive leather-bound note book, containing specially arranged pages and index for jotting down memoranda of a trip to the United States.

Election of Officers

At the meeting of trustees following adjournment of the annual meeting, the following officers were elected: President, Gordon C. Edwards, Ottawa, Ont.; First Vice-President, W. W. Knight, Indianapolis, Ind.; Second Vice-President, A. L. Stone, Cleveland, Ohio; Secretary, E. F. Perry, New York; Treasurer, Henry Cape, New York.

Among the Canadians present at the convention were Gordon C. Edwards, Ottawa; A. H. Campbell, of the Campbell-MacLaurin Lumber Company, Montreal; W. A. Filion, of E. H. Lemay & Company, Montreal; Guy H. Long, and J. M. Donovan, of the Long Lumber Company, Hamilton; R. G. Cameron, of Cameron & Company, Ottawa; Frank Hawkins, secretary of the Canadian Lumbermen's Association, Ottawa; D. McLaren and C. W. Wilkinson, of the Union Lumber Company, Toronto.

A Courteous Compliment to Canada

National Wholesalers Elect Gordon C. Edwards, of Ottawa,
as President for the Current Year

G. C. Edwards, New President
of National Wholesalers

firm of W. C. Edwards & Company, Limited, to which the new president belongs.

Mr. Gordon C. Edwards has taken a very active interest in lumber association work for many years and has been one of the most energetic members of the National Wholesale Lumber Dealers' Association. The active interest which he has taken in this association naturally marked him out for a prominent executive position and he has advanced by annual stages until, during the present year, he has achieved the highest office upon its executive. There is no question that the association will benefit greatly by this appointment and also that the mutual goodwill existing between lumbermen of both countries will be materially increased by this courteous evidence of brotherly feeling.

Mr. Gordon C. Edwards was born at Thurso, Que., on November 12th, 1866, a son of J. C. Edwards, of Ottawa, and a nephew of Senator W. C. Edwards. He comes, therefore, from one of the best known lumbering families in the Ottawa Valley. Although a large lumbering business had already been built up in the Ottawa Valley, under the name of Edwards, before Gordon C. Edwards came into the world, he is a notable example of a self-made man. He started in the lumber business with W. C. Edwards & Company, Limited, at Rockland, Ont., in the spring of 1885, and from the very first, set himself to master all the intricate details connected with the business. His first occupation was measuring lumber. Then in the fall of 1885 he went to the woods for the Canada Lumber Company of Carleton Place, Ont., (a company with which he was connected, being one of its directors). During the winter of 1885 and 1886, he was engaged in scaling and inspecting logs for this company and in the spring of 1886 he entered the company's yard at Carleton Place and measured and shipped lumber for that season. In the following winter, that of 1886-7, he accompanied one of the inspectors of W. C. Edwards & Company, Limited, in their woods operations on the Nation, Blanche and Gatineau Rivers, his main object being to obtain a thorough knowledge of the woods operations. In the spring of 1887 he took charge of a mill for the Canada Lumber Company at Mississippi, Ont., and in the fall of the same year was appointed secretary-treasurer of the company and took up his quarters at their head office at Carleton Place, where he obtained a thorough knowledge of the books and accounting department of the business. In the year 1892 he joined the Ottawa Lumber Company of Ottawa in the wholesale lumber business.

In 1895, when W. C. Edwards & Company, Limited, purchased its New Edinburgh plant near Ottawa, Mr. Gordon C. Edwards returned to the employ of this company, first in the capacity of salesman and shortly afterwards as manager, a position which he still holds. The company at New Edinburgh carry on a wholesale and retail lumber business, in addition to operating planing mills, hardwood flooring mills, sash and trim factory, etc. In 1892 Mr. Gordon C. Edwards was elected a director of W. C. Edwards & Company, Limited.

Mr. Gordon C. Edwards, although in charge of one of the largest lumbering concerns in the Ottawa Valley, extends his interests to many other companies, clubs, and charitable institutions. He is a past president of the Canadian Club of Ottawa; past president of the

Y. M. C. A. of Ottawa; member of the Council of the Ottawa Board of Trade; president of the Capital Planing Mill Company, Ottawa; secretary-treasurer of the Library Bureau of Canada, Limited, Ottawa; president of the Ottawa Construction Company, Ottawa; vice-president of the Dominion Warehousing Company, Ottawa; director of the Imperial Realty Company, Ottawa, and director of the Ottawa & Hull Power & Mfg. Company, Ottawa. He is also connected with the following companies outside of Ottawa, in each of which he is a director: Robinson-Edwards Lumber Company, Burlington, Vt.; Manufacturers' Lumber Company, New York; Cascapedia Manufacturing & Trading Company, Cascapedia, Que., and Simplex Floor Finishing & Appliance Company, Limited, Montreal, P.Q.

His club interests include the Rideau, Laurentian, Country, Ottawa Hunt and Royal Ottawa Golf, of Ottawa, together with the York Club of Toronto, the St. James Club of Montreal and the Transportation Club of New York. In addition to these Mr. Edwards is also a member of several fish and game clubs.

Mr. Gordon C. Edwards' interests in association work induced him to be one of the most active promoters of the Canadian Lumbermen's Association, of which he was the first president and is still a member of the Board of Directors.

The largest mills operated by W. C. Edwards & Company are situated on the Ottawa River at Rockland, Ont., some 25 miles east of Ottawa, where the company operate two sawmills and a planing mill. Their Ottawa plant consists of a sawmill, three planing mills, hardwood flooring mill, sash, door and trim factory, cutting-up mill and box factory and five retail yards. They are also holders of large quantities of spruce, hemlock and hardwoods. In addition to the interests already mentioned they are interested in the Cascapedia Manufacturing & Trading Company, Cascapedia, P.Q., and the Bathurst Lumber Company, Bathurst, N.B.

Cannot Export Shingle Blocks

The Court of Appeal has decided that sawn cedar blocks can not be exported from the province of British Columbia under the guise of "sawn lumber," thus upholding the judgment of Mr. Justice Clement in the suit of the Minister of Lands vs. Excelsior Lumber Company. The judgment of the Appeal Court was handed down at Victoria recently. This decision is of great importance to men employed in the shingle-cutting trade, for it will prevent any of the business of shingle-cutting passing to the shingle mills of Washington. The suit arose over the action of officials of the timber and lands department seizing several carloads of sawn cedar blocks en route for Washington in Great Northern Railway cars. These blocks were capable of being used as shingle bolts, and under the section of the act which prohibits the export of shingle bolts, the consignment was declared confiscated.

In claiming replevin of the goods, the Excelsior Lumber Company did not deny that the blocks were intended to be used for the manufacture of shingles, but relied on the portion of the act which exempts "other sawn lumber" from the general prohibition in regard to export. Mr. W. B. A. Ritchie, K.C., in his argument, pointed out that the blocks were sawn on every face, and had been manufactured as such in this province. Mr. A. D. Taylor, K.C., represented the province in the argument, which resulted in Mr. Justice Clement refusing to order replevin. His Lordship held that the blocks, though sawn, were really shingle bolts, and that the sawing done to them did not alter their character to the extent of causing them to be classified with the schedule of manufactured lumber as "other sawn lumber." The Excelsior Lumber Company entered an appeal, which was argued by the same counsel who appeared at the trial. With the exception of Mr. Justice Martin, who dissented, the full court upheld the judgment of Mr. Justice Clement. The cars of cedar blocks seized by the government were returned to the Excelsior Lumber Company as an act of grace following the decision of Mr. Justice Clement, with the understanding that no further export was to be attempted pending the result of the appeal.

Duty Wrongly Exacted

The board of United States general appraisers decided to-day that wood pulp and newsprint paper produced from wood cut on Crown lands in the Province of Quebec had not been assessed by the Dominion Government with countervailing duty when exported to this country, and that, accordingly, free entry should have been granted when imported here under the Canadian Reciprocity Act of July 2, 1911.

The action of the collectors of customs at Detroit, Buffalo, Burlington, Plattsburg and Port Huron, in exacting duty, was reversed. The importers included the Laurentide Paper Company, Limited, William A. Bird, the Central Vermont Railway Company, and others. A somewhat similar claim was made by the News Pulp and Paper Mill Company, but overruled for lack of evidence.

New Brunswick Receipts Show Increase

Crown Land Department Reports Greater Payments on Licenses, Renewals and Royalty—Large Sum Received for Bonuses—Results of Year's Operations

The fifty-third annual report of the Crown Land Department of the province of New Brunswick for the year ending October 31st, 1913, has just been published. The receipts of the Department for the year amounted to \$773,274.74. After deducting \$271,720.69 which was received for land sales and bonuses and goes to the sinking fund, the net revenue is shown at \$501,554.05. The revenue of the Department, which is of interest to the lumbering industry is as follows:—

Receipts	Year 1912	Year 1913
Sales of Timber Licenses	\$ 3,145.00	\$ 18,169.50
Renewal of Timber Licenses	80,708.00	81,236.00
Stumpage	339,604.18	305,818.62
Royalty	4,649.70	13,510.39
Transfers of Timber Licenses	4,037.00	1,472.00
Bonuses Timber Licenses		255,335.76

Record Receipts for the Department

The Minister of Lands and Mines, in his preface to the report says that all records of receipts from territorial revenue were broken during the year. The principal increase was derived from the bonus on the timber licenses authorized by an act of the legislature last year. This legislation was probably one of the most important measures ever placed upon the Statutes of the Province and settled for at least twenty years the tenure and conditions upon which lumber is to be cut upon our Crown Lands. It was a matter that received the utmost consideration and the best thought of the Government, and the result has been a great source of satisfaction to your Executive and myself in the manner in which it has been received by the public and the satisfactory way its stipulations have been met.

A constant demand had been made by lessees during the last few years that the Department should disclose some policy with regard to the future disposal of the Crown leases and while many projects were put forward by the lumbermen, none of those had the approval of the Government, whereby the public would receive a fair return for the granting of these valuable privileges.

I was fairly convinced the lessees were making a reasonable request even five years before the expiry of the old licenses (1st August, 1918) when they asked to have a future tenure fixed in order to afford a guarantee for the large amount of capital invested in the lumber industry and particularly to afford security to the Banks and Trust Companies who are called upon to make large advances in the carrying on of the lumber business. We therefore brought into existence the "saw mill license" which provided that every lessee would have the right to renew his license for a period of 20 years provided he agreed to pay a reasonable bonus according to the value of the land and also agreed to pay such a revised rate of stumpage and mileage as might be fixed from time to time by the Lieutenant-Governor-in-Council. To arrive at this valuation I took the best means at my disposal to have the lands placed in four classifications, viz., A, B, C, D, the respective bonus rates being \$100 for Class A, \$75 for Class B, \$50 for Class C and \$20 the present upset price for Class D. While I do not claim the classifications made were perfect, I do maintain, that, as a whole, an equitable arrangement was made and satisfactory on the whole to the lumbering community of the Province.

Under the provisions of the Bill I have taken steps to procure a more detailed classification of the public lands to be completed by the 1st August, 1917, setting aside the tracts suitable for agriculture and segregating lands only fit for the growth of lumber.

The provisions of the Bill respecting pulp and paper licenses will appeal to every fair minded person as legislation in the interests of the Province, whereby fifty per cent. of the lumber cut under this class of license must be manufactured into pulp and paper in New Brunswick.

Out of a total quantity of 10,147½ square miles under license last year, 9,654½ square miles have been renewed under the saw mill license; 116 square miles have been renewed under the pulp and paper license and 377 square miles were renewed under the Old Act which expires 1st August, 1918, when the latter licenses will be put up for sale or otherwise dealt with as the Lieutenant-Governor-in-Council may decide.

The outcome has certainly been very gratifying to the Government and settles one of the hard problems of the past.

Owing to the stringency in the money market and in order to make the provisions of the Bill less onerous to the licensees I saw fit to divide the one half payment due on August 1st, 1913, accepting one half of the bonus in cash and the other half by note at 5 per cent. payable 1st August, 1914. This arrangement was largely accepted and appreciated by the licensees. Considerably more than half has been paid in cash.

The Cut of Lumber

Referring to the cut of lumber during the year the report says:— In comparing the stumpage receipts with last year there will be observed a falling off of nearly \$34,000 which is perhaps a matter of some congratulation. For some years it has been considered by the Department that we were cutting very nearly up to the annual growth and possibly may have been exceeding it, leaving nature to battle against these adverse conditions. Stringent regulations have been made from time to time to prevent undersized cutting and in some localities more drastic conditions will have to be enacted in order to perpetuate our forests. There is no doubt a policy of thinning might be advantageously carried out if conducted under competent men, but a general policy of that kind might not give the necessary results. These and other matter with respect to the forest growth are receiving my best attention.

From the present outlook the cut of lumber this year will not be up to the aggregate of last season but while this may result I anticipate a larger revenue from stumpage dues.

For a good many years the rates of stumpage have not increased with the same ratio as the increase of the price of lumber or the increased value of lumber lands generally. While there was a disposition on our part not to place unjust burdens on the lumbering community, we thought with all fairness stumpage rates could in some instances be advanced, commensurate with these increased prices. A new schedule of stumpage rates was approved, and became effective August 1st last. I am quite satisfied the increases so made have been fair to the lumbermen and justly due the Province.

Notwithstanding the dullness of the money market the stumpage dues and renewal rates were well met on the first of August. There were few complaints of overscaling which in a large measure is due to the very satisfactory system now in force, over the 10,147½ square miles under license.

The only fire of any considerable importance was that which occurred at the Head Waters of the Tobique on lands under license to Messrs. Stetson, Cutler and Company. New Brunswick, was fortunate during the past year in having so few fires of a serious nature. Precautions were taken, however, and orders issued to every warden in the Province to be alert at the first appearance of forest fires. A time will come, however, when these fires will menace the forests and large grants must be annually set aside to provide for this service and a necessary force must always be kept in hand to fight the fire demon.

A recapitulation of timber licenses shows that 10,145½ square miles were renewed during the year and new applications were granted for 92 square miles, making the total now under license 10,237½ square miles.

Statistics of Crown Lands Operations

The quantity and kind of lumber cut from Crown Lands, for which stumpage bills were rendered during the year, with the amount charged thereon is shown in the following table:—

Kinds of Lumber	Quantity	Stumpage
Spruce and pine logs	173,106,846 S. Ft.	\$222,991.80
Fir logs	58,492,475 "	46,793.98
Cedar logs	21,725,578 "	27,156.97
Hardwood logs	2,399,765 "	1,919.81
Hemlock logs	11,194,195 "	4,477.80
Hemlock logs peeled	2,752,296 "
Poplar logs	550,000 "	400.00

270,221,155 S. Ft.

Wood (fire and pulp)	1,015 Cords	631.80
Hemlock bark	733 "	586.40
Sleepers	334,319 Pieces	8,357.97
Posts	1,850 "	27.75
Telegraph poles	60 "	9.00
Boom poles	6,000 "	120.00

\$313,473.28

Add old accounts	\$3,405.80
Less allowances	1,552.42

The appendix to the report contains the new timber regulations passed on August 1st, 1913, and the Forest Fire Law of the province.

St. Maurice Timber Well Protected

Annual Meeting of Association—Report Shows Successful Record During a Very Dry Season

The excellent work which is being done by the St. Maurice Forest Protective Association, with headquarters at Three Rivers, P.Q., was reviewed and discussed at the annual meeting and dinner, held on February 24 at the Place Viger Hotel, Montreal. Mr. J. M. Dalton, of the Gres Falls Company, presided at the annual meeting, and those present were: E. J. Graham, James MacLaren Company, Buckingham, P.Q.; Mr. O'Niell, of the E. B. Eddy Company, Hull, P.Q.; W. C. Hughson, of Gilmour and Hughson, Hull, P.Q.; Carl Riordon, J. B. White, and E. Read, Jr., of the Riordon Pulp and Paper Company, Montreal, P.Q.; J. E. Rothery, of the J. MacLaren Company, Buckingham, P.Q.; P. MacLaurin and Alex. MacLaurin, of the Gres Falls Company; J. Sutherland, of the Department of Public Instruction; J. M. Spaidal, Quebec and Lake St. John Railway; J. H. Dansereau; W. H. Parker, of the Laurentian Fish and Game Club; S. L. de Carteret, of the Quebec and St. Maurice Industrial Company; R. F. Grant, of the St. Maurice Lumber Company; F. L. Ritchie, of the Wayagamac Pulp and Paper Company; Ellwood Wilson, of the Laurentide Company, Grand Mere P.Q.; and L. E. Parent, of the St. Agathe Mills.

In his report, the President pointed out that the association, the only one of its kind in Canada, had during the past season demonstrated its usefulness and the value of the principle of co-operation. Although the summer was the driest since 1908 the actual fire damage was less than 1/1000 of one per cent. of the value of the timber on the territory patrolled. The association has had a steady growth, 102,000 acres having been added to its territory in 1913, and, so far this year, over 266,000 acres have been added. The Hon. Jules Allard, Minister of Lands and Forests, and Mr. W. C. J. Hall, of the Forest Protection Branch, had heartily co-operated, while the manager, Mr. Henry Sorgius, and the inspectors had worked loyally in the interests of the members. The extension of telephone lines and the erection and equipment of look-out stations were recommended. The greatest need at present was the better education of farmers and settlers, and the president suggested that the association request the co-operation of the Minister of Education, asking him to distribute suitable literature in the schools and to send lecturers, equipped with either lanterns or moving picture machines, to the small towns and schools.

The Work of the Year

It was stated in the manager's report that during the past season a fourth division, comprising railway patrols, was established. The area patrolled pertaining to members of the association was 7,279,053 acres, or 11,373.52 square miles. This figure does not include Government lands not under license or lots taken up by settlers, which latter were the greatest source of danger and the scene of 50 per cent. of the fires. The area patrolled pertaining to members was equivalent to 16 1/4 per cent. of one-sixth of the lands under license in the Province. This area was divided into four divisions and twenty-five districts, sixteen of which were each patrolled by two men in canoe; five, each by one man on horseback or on foot; and four, each by two men on motor car. Of the fires, totalling 306, settlers started 115, 51 settlers were fined; 17 fires were started by river drivers; eight by fishermen and sportsmen, and 17 by railways.

The railways under the jurisdiction of the Board of Railway Commissioners of Canada and the Quebec Public Utilities Commission were required to patrol their rights of way at their own expense. The National Transcontinental Railway, being still under construction, did not come under either of the above, so was patrolled by the association, the cost being borne equally by the Transcontinental Commission, the Provincial Government and the Association. The part patrolled was from Lake Mesquety to Parent, a distance of 167 miles. Five motor cars were used—four in continuous service on regular beats, the fifth being kept ready in case of emergency. The report also stated that as the result of their experience, it was demonstrated that the spark arresters are not spark-proof and do not give the protection which is claimed. As the cost of extinguishing fires fell largely on the limit holders, the government should be asked to pay half the actual cost, instead of the present contribution of \$1 per man, per day.

Eight lookout stations and fifteen miles of telephone wire were constructed during the past season, but more lines are needed to form an adequate system. Two hundred miles of trail and portage were cut. The patrols travelled 60,805 miles.

The manager made the following recommendations:—That the association request the Provincial Government to:—Amend the Forest Laws, to require all persons desiring to burn clearings or debris in the vicinity of the forest at any time of the year, to obtain first a written permit from the ranger in charge of the district; that the government pay half the actual cost of fighting fires; that it be made obligatory for every citizen to respond to the call of fire rangers for

assistance to fight fires; that the association confer with the Superintendent of the Forest Protection Branch and the Superintendent of Public Instruction in regard to the free distribution of literature relative to Conservation and Forest Protection, in both languages, to the school children throughout the province.

In the course of a discussion, Mr. E. Read, Jr., gave details of the telephone lines at the Riordon Pulp and Paper Company's limits at St. Jovite, P.Q.

Mr. J. C. Sutherland stated that the Provincial Department of Public Instruction was anxious to co-operate with the association in educating the children on questions of conservation, the value of forests, and protection from fire, and any suggestions from the association would be very sympathetically considered. Two years ago the Department issued to every school in the province circulars in English and French dealing with conservation, and also took steps to impress on the minds of the scholars the importance of forestry subjects.

The Chairman referred to the important part forest protection held in the educational programme in the west, where literature on the subject is furnished to all the schools.

The question of permits given by government officials to settlers to burn slash was also briefly discussed, and complaint was made that in one instance a permit was granted during the close season. It was suggested that the government should place the authority to issue permits in the hands of the association, which would safeguard the interests of limit owners.

More Assistance Asked from Government

It was decided to request the government to give further assistance in protecting the forests, such additional money to be spent in fire protection and not in appointing additional inspectors. The resolution pointed out that the provincial revenue from forests last year had been \$1,760,466, with an expenditure of \$327,383, while there had been appropriations of \$18,000 for fire protection, \$90,000 for forest service and inspection, and \$5,000 for forestry education. They therefore asked that the amount voted for fire protection be increased to \$50,000 at least.

On the motion of Mr. Ellwood Wilson, it was agreed to ask the Dominion Government to require the Transcontinental Railway to patrol and clean their right of way at their own expense.

A committee will be appointed to call, at Ottawa, a meeting of all limit holders in the province with a view to forming protective associations for the Ottawa, Gatineau and Lievre Valleys, and also to forming a federations of such associations.

It was decided to continue the present plan of assessing all members for the cost of emergency fires, and a new by-law was passed in substitution of the one putting such cost on individual members.

The balance sheet showed an income of \$23,779, and an expenditure of \$23,054, \$725 being the back balance.

The following new members were admitted: Tourville Lumber Company, Charlemagne and Las Quareau Lumber Company, and St. Gabriel Lumber Company.

Election of Officers

The following officers were elected: President, Mr. S. L. de Carteret; vice-president, Mr. Ellwood Wilson; manager and secretary-treasurer, Mr. H. Sorgius; directors, Messrs. J. M. Dalton, S. L. de Carteret, Charles Le Brun, R. F. Grant, F. L. Ritchie and Ellwood Wilson.

At the dinner in the evening Mr. Ellwood Wilson presided. There was only one toast—"The King"—and with the exception of the speech of Hon. Jules Allard, Minister of Crown Lands and Forests, the proceedings were more or less informal. Mr. Wilson referred to the assistance given to the association by Mr. Allard, and to the foremost place of the province in forestry work.

Mr. Allard expressed the appreciation the Provincial Government entertained for the work of the association in aiding its efforts to prevent the destruction of the forests of Quebec by fire. The province had many resources, but amongst the greatest were its closely related riches in forests and water powers. The government had, during the past few years, put into force a system of forest protection which had proved so effective that it had been followed by Ontario, with the result of a co-operation in this work between the two provinces which had proved of great economic advantage. It was the policy of the government to educate the public to the necessity for doing everything possible to prevent forest fires, and to show them that any negligence which might cause such a fire was really a crime. As to the demand of the association for \$50,000 a year for forest protection, he was not so certain as to whether it would be acceded to, as the government was pretty generous as it was, but he promised that everything possible would be done to protect the forests.

Mr. Clyde Leavitt, chief fire inspector of the Railway Commission and forester for the Conservation Commission, gave some details of the work of the former body in preventing fires. The Board had

required the railway companies, subject to their jurisdiction, to take reasonable measures to protect the forests, special patrols being the main thing in view. During 1912 arrangements were made for precautions in the West, and these had worked admirably. The situation had in fact greatly improved. The co-operative arrangements made in Ontario, Quebec and New Brunswick had also worked out well, especially in Quebec, with the result that there was not a single serious fire due to railways during the past season. While the system was not perfect, the results showed that the idea of co-operation was the right one. The inspectors' staff was to be increased and they looked for better results. The Federal Government realized that their lines should be adequately protected from fire. The association might perhaps take a broader view than protection only—it might consider the question of perpetuating quality as well as quantity of forest products. The methods which economic conditions forced lumbermen to adopt were destructive; there were very heavy depletions of white pine and birch in comparison with inferior lumber, such as hemlock, and it was important that they should find uses for these inferior species in a way which did not seem feasible at present.

Mr. J. Sutherland, Mr. W. H. Parker, and Mr. Carl Riordon also spoke briefly.

Mr. S. L. deCarteret outlined a scheme for the insurance of timber lands. They all, he said, insured their sawmills, but there was no insurance on limits, for the reason that the great bulk of them were in inaccessible territory, where no patrol could be made. He suggested the formation of a mutual insurance company in Canada and the United States, which would pool its interests to insure the limits. If premiums of $\frac{1}{4}$ of 1 per cent. were levied on the value of the standing limits, about two million dollars per annum would be received. He pointed out that, during the past ten years, the fire losses on patrolled limits had not exceeded $\frac{1}{2}$ of 1 per cent. and this was being gradually reduced to $\frac{1}{4}$ and $\frac{1}{8}$ of one per cent., while in the case of their own association the loss was $\frac{1}{1000}$ of one per cent. Such an insurance would involve the appointment of boards of valuation throughout the country. He thought $\frac{1}{4}$ of 1 per cent. would be a very reasonable rate, and sufficient to pay all expenses. In one instance in the Province of Quebec a company had insured its limits with Lloyds, but no damage was payable unless the loss was \$50,000, and there were other restrictions. The experience of their association was a basis for the formation of an insurance association.

Mr. James Lawler, secretary of the Dominion Forestry Association, Ottawa, asked for the assistance of the association in connection with a meeting to be held in Halifax in August.

At the conclusion of the speaking Mr. Ellwood Wilson showed a number of slides illustrating the destructive effect of forest fires in the Province of Quebec.

Riordon Company's Annual Report

For the year ended December 31 the profits of the Riordon Pulp & Paper Company were \$309,679, an increase of \$2,845. The net profits amounted to \$228,073, and, after payment of bond interest and preferred stock dividends, a balance of \$68,073 was added to profit and loss surplus, making a total of \$157,301. Mr. Carl Riordon, the president, in his report, states that improvements and additions to the plant at Hawkesbury were completed during the year, but owing to the business depression prevailing in Canada and the United States during the past year, the company were unable to market the full production, with the result that total sales during 1913 fell short of 1912 sales by \$98,946. The directors propose to reduce the current liabilities by the sale of bonds when the market is favorable, and, as the company was able to sell the full production during the last three or four months, it was reasonable to expect that when spring started they would be able to market the surplus product now on hand. About 84 per cent. of the company's production for 1914 was already sold at satisfactory prices. The outlook for the company's business for the current year was very good indeed. The production of sulphite pulp was increased at both mills by 30 to 40 per cent., and it was proposed to increase the output of the principal lumber mill this season by running the mill at night as well as in the day time, as prices obtainable were the highest ever received.

A recent report in these columns of the annual statement presented by the Anglo-Newfoundland Development Company, for the year 1913, contained an unfortunate error which made it appear that the company intended to carry out further extensions of its operations under the present Newfoundland tariff conditions. The statement should have been to the effect that "no further extensions" of the company's operations will be made during the continuance of the present Newfoundland tariff.

Mr. C. A. Larkin, of the C. A. Larkin Lumber Company, Limited, Toronto, has left on a six months' trip to Europe, accompanied by Mrs. Larkin and two daughters.

Talks With Lumbermen of British Columbia On Trade Papers and What They Mean

No. 7—By Douglas Fir

AND now friends, we are coming to the close of our talks, and I wish to tender you my hearty appreciation of the hearing which you have given me. If I were to judge the earnestness of your attention by your silence, or lack of interruptions throughout this series of talks, then I do not know what more any man could desire in the way of attention. But being something of a student of human nature, I feel quite safe in venturing the assumption that there are many subscribers of the Canada Lumberman who have never read these articles at all. I know of people who actually think that they have not time to read their own Trade Journal, and I pity them, and God only knows what the world will do when they are gone.

I once knew a stationary engineer, and a very good man he was too, but awfully narrow in his ideas. He knew absolutely nothing about his work except that which he had worked out himself. He would not learn from another, and I have many a time heard him scoff at the man who would read with the hope of acquiring knowledge that he could convert to practical use, and indeed, more than once did this man call me the "Scientific American Man," because I used to read that paper. Now life is so short for any one man to acquire all the knowledge that there is going on these days, by his own personal observations, and this is why an exchange of ideas, a diffusion of knowledge is necessary, and yet there are men in our business who will go many miles, and spend much time to be present at an association meeting, who think they have not time, or that it would be a waste of time to read the ideas of others in their trade paper. Personally I look upon the pen as being a mightier weapon than the tongue, though, of course, I know that there are some who take the opposite view. There are those who, if they were asked why they take their trade paper, would probably reply that they considered it good reading for the boys in the office, or perhaps others of their employees, but personally they had passed out of it. The man who knows it all in these days, and who does not want to swap information by the way side, as it were, with others who have perhaps been over the road which he may be just starting out upon, may waken up sometime to find himself mighty near the precipice at some turn where he least suspected danger, and then he will wonder at his plight. The danger sign may have been there in its proper place, but he either didn't have time, or else was too sleepy to read it. The man who does not read his trade paper is riding past the danger signals and does not know it, and then if he goes too fast at some point where he should have gone slow, and gets a tumble in consequence, he is loath to take any of the blame to himself. There are many valuable articles appearing in the Canada Lumberman from time to time, other than those from my pen, and the man who does not read them either is not able to appreciate them, or thinks that he carries such a superior store of knowledge himself that he has no need for more.

In this series of talks I have endeavored to point out to you many of the errors that are being made in the conduct of the business by some of those engaged therein. I know that in some cases I have gone from the sublime to the ridiculous, but not un-intentionally. Then I have directed your attention to one hundred things which ought not to be done. This also must be read with comprehension broad enough to cover the subject, if you would get the true meaning. I have given you about two hours and thirty minutes talk, at the rate of one hundred words per minute. The editor of the Canada Lumberman has been good enough to give his valuable space for the publication of these articles. Neither the editor nor the writer have anything to gain by this, except that you read, and you first are benefitted. We know that many cannot be benefitted without benefitting the business as a whole, and this is where we hope to come in for our little share. If we can only be instrumental in bringing about a few of the many, much needed reforms, we will feel amply repaid for all the effort we have given to this subject.

I might say that we did hope that we might have had an exchange of ideas upon this subject, and perhaps it is not time yet to abandon our hopes in this direction. It is a big enough subject, and important enough for a dozen writers, and still there might be important things to be said, so come along friends, and let us have your ideas. And now thanking you for your tolerance, and the Editor for his valuable space and co-operation, I bid you adieu.

Mr. F. M. Dixon, who was for some years with Smart-Woods, Limited, and Grant-Holden-Graham, Limited, has opened an office in the Beardmore Building, Montreal, for lumberman's supplies.

The Commercial Importance of Beech

Third of a Series of Articles upon Native Canadian Woods—A Wood with a Wide Range of Miscellaneous Uses

By R. G. Lewis

Typical Beech Tree growing in a close stand.

Ash—0.51 per cent. of weight of dry wood.

Fuel Value—92 per cent. that of white oak.

Breaking strength (modulus of rupture)—16,100 pounds per square inch or 128 per cent. that of white oak.

Factor of Stiffness (modulus of elasticity)—1,697,800 pounds per square inch or 128 per cent. that of white oak.

Generally speaking the wood of American beech (*Fagus grandifolia*) is very hard, tough, strong and heavy. It is moderately stiff and has a close, straight grain in old trees (young trees are often cross grained). The wood splits easily but is difficult to season; warping, twisting, shrinking and checking during seasoning. Once properly seasoned it holds its shape fairly well but is not durable in contact with the soil. The wood is both tasteless and odorless.

Lumber Takes a Good Polish

The finished lumber takes a good polish and wears smooth under friction. The heartwood is usually dark in color, and the sapwood nearly white. The sapwood is undesirable for most purposes. Many manufacturers claim that the use of beech would increase if the sawmills were more careful in separating heart from sap lumber. The color of the heartwood varies greatly according to soil conditions. Trees growing on deep, well-drained soil produce darker colored lumber which is claimed to be much superior in its physical qualities. This is often called "red beech" although it is not a separate species. In fact there is only one species of beech in America. The tree commonly called "blue beech" or "ironwood" (*Carpinus caroliniana*) belongs to another genus.

Some manufacturers say that "red beech" is merely the result of steam drying ordinary beech. Others call the heart of mature trees "red beech" and the sapwood "white beech." Considerable confusion seems to prevail in the use of these terms which should be considered merely as describing the color of the lumber and not the tree from which it is cut.

Beech in Canada ranges through the three Maritime Provinces, Southern Quebec and Ontario. It is not found north of a line running from Bay Chaleur westward, crossing the St. Lawrence in the neighborhood of Rivier du Loup and running a few miles north of the St. Lawrence and Ottawa rivers to Lake Temiskaming. From here the line dips south westward to Sault Ste. Marie. Beech is not found in Canada west of this point. In the United States the tree is found as far west as Wisconsin and Texas and southward to the Gulf of Mexico.

Canada cut a total of 15,417,000 feet board measure, of beech lumber in 1912. Ontario produced two-thirds of this amount, Quebec about 14 per cent., Nova Scotia 12 per cent., New Brunswick 6 per cent. and Prince Edward Island the small remainder.

A Valuable Railroad Tie Material

Canadian railways purchased in 1912 over 104,000 beech ties, and of these at least 90 per cent. while not white, were treated chemically before being laid in the roadbed. While beech possesses the strength,

stiffness and spike-holding qualities necessary for a tie material, it decays rapidly in contact with the soil and makes preservative treatment imperative. More ties of creosoted beech are used in European railways than of any other wood. Creosoted beech paving blocks have the strength and hardness necessary for an ideal wooden pavement. The wood is easily treated with creosote and the treatment usually results in an increased life of from three to four hundred per cent.

Beech in Canada has always ranked high for slack cooperage, coming sixth on the list for staves and heading. It is also used occasionally for tight staves in fish barrels on account of its lack of taste and odor.

The use of this wood has been restricted in the past because of the difficulties encountered in its seasoning. These same difficulties have given rise to unjust prejudices against many of our native woods. We import large quantities of red gum and oak from the United States and neglect our own birch, beech and poplar. Red gum is one of the most difficult woods on the market to season. It requires careful steam drying from the saw to overcome its tendency to warp and twist. The same careful treatment applied to some of our native woods would result in a lumber of at least equal quality. Beech is stronger than oak in many ways. It has a finer and more even grain and costs about one-third as much.

At the present time in Canada beech is probably used for fire wood more than for any other purpose. It is usually sold mixed with maple or birch and large quantities of the smaller and more inferior trees are used in this way.

Apart from its use as fuel, beech is used in greatest quantity in Ontario for the manufacture, by destructive distillation, of charcoal, wood alcohol and commercial acetates, although little wood is used for this purpose that could be sawn into lumber.

An average cord of wood yields about 46 bushels of charcoal, 7 gallons of crude alcohol and 130 pounds of acetates. The uses of charcoal are well known. Wood alcohol is used chiefly as a solvent for varnishes and shellacs. The acetates are converted into acetic acid (wood vinegar), ether and acetone.

Large Quantities Used for Flooring

The manufacturers of hardwood flooring use large quantities of this wood and often sell it mixed with birch for floors in dwellings. The wood is hard and close grained and takes an excellent polish. In factories and warehouses it makes an ideal floor which stands the wear and tear of truck wheels and other hard usage better than any other moderate priced flooring. This industry probably consumes the greatest quantity of sawn lumber of this species.

In the manufacture of furniture, beech has always been a popular material for framework and "inside work." It is seldom used for "outside work" in expensive furniture, although quarter-cut material exhibits a striking silver grain. The value of the wood for this purpose lies chiefly in its strength and the fact that when subjected to friction the surface tends rather to wear smooth than to develop inequalities. It is greatly prized for the manufacture of drawer slides, sliding parts for filing cabinets, extension table slides and all parts of furniture subjected to friction. The wood does not swell or shrink with changes in humidity and its use reduces the annoyance due to drawers and other parts becoming jammed. It is used in greatest quantity by furniture makers for "inside work" and framing on account of its strength and its ability to stand irregular strains and twists. It is also used extensively for "outside work" in the manufacture of the cheaper grades of furniture, especially chairs. Beech washes well and is free from taste or odor, and is prized for kitchen table tops and kitchen furniture on this account.

For interior finish, beech is valued more for strength than beauty of appearance, as the wood has little or no pronounced grain or figure except on quarter-cut material. It goes chiefly into door sills and stair material. Slack-cooperage manufacturers use beech for staves and heading in barrels used to contain products that would be spoiled by a wood with a strong odor. Its strength recommends it for nail kegs and hardware cooperage.

Beech is noted among our native woods for its ability to withstand friction when under water. The axles and shafts of old fashioned water wheels were made entirely of this wood. The knowledge of this quality in the wood has led to its use in laundry machinery where the wood is subjected to friction and is constantly moist. It

is not constant moisture which causes a wood to decay, but alternate wetting and drying.

In the Maritime Provinces of Canada this wood is used in greatest quantity for the manufacture of brush backs and handles, and its use in other parts of Canada for this purpose is also extensive. The wood is tough and resists splitting when nailed or bored for bristles, and is consequently valued for rough unpolished scrub brushes, stable brooms, kalsomine and whitewash brushes and paint brushes.

Extensively Used for Handles

Beech is used to a great extent in the manufacture of tool handles where great toughness and elasticity are not essential. For hammer and axe handles hickory will always be the favorite wood, but for the handles of wrenches, screw drivers, chisels, gouges, gimlets, corkscrews, awls and for plane blocks and spirit levels, beech is one of the best woods available because of its hardness and its quality of wearing smooth under friction. This wood is often used as a substitute for apple in hand saw handles. Two handles are cut from a pattern with a scroll saw from a piece $4\frac{1}{2} \times 1\frac{1}{4} \times 12$ in. The use of this wood for broom handles is very extensive in spite of its weight and dark color. The handles are turned from 2-inch squares about 5 feet long.

For agricultural implements and vehicles, beech is a useful wood, but is used more extensively in the Maritime Provinces than in Ontario. For all parts of framework where elasticity combined with toughness are not essential qualities the wood can be used to advantage. It is used in the Maritime Provinces for heavy spokes and gear stock. For all articles requiring a wood free from taste and odor, beech will always be a favorite. Boxes to contain foodstuffs, butter pails, lard tubs, ice cream freezers, meat and bread boards, packing house tables, butchers' blocks, skewers, kitchen furniture and woodenware, wooden plates and refrigerators are all examples of uses of this wood, due partly to its strength but mostly to its tastelessness. Bakers' woodenware such as peels, proofs, troughs, trucks and racks are often made of beech for the same reason.

Beech produces a strong, tough veneer that is used for a large number of commodities. This veneer is usually "rotary cut" or "peeled" veneer. The logs are steamed for several hours and then revolved in a veneer lathe against a heavy fixed blade which peels off a thin sheet of wood. The standard thicknesses run from 1/50 to 5/16 of an inch. The more usual thicknesses are 3/16, 1/8, 1/4, 5/16 and 1/2, the great bulk of the product being of the 3/16 thickness. This veneer is not used to cover cross banding or core stock for ornamental purposes like mahogany or oak veneer, but is used for what are called "built-up" products. Two or more layers of veneer are glued together usually with their grain at right angles, and the resulting product is used for chair seats and backs, drawer bottoms, panels, trunk boxes, vehicle body panels and packing cases. This "built up" lumber is stronger and lighter than solid material of the same thickness and is less likely to warp or split. Single layers of veneer are made into baskets, crates, berry boxes, butter boats and wooden pie plates or "picnic plates." Sawn veneer which is in reality thin lumber sawn with a special saw of large diameter is made into dry measures, cheese boxes and rims for sieves.

Good Material for Dowels

One of the most important uses to which this wood is put is the manufacture of dowels. The wood is sawn into squares of the proper size and kiln dried. It is then run through a machine which turns out the finished product. These long cylindrical rods of various diameters are bundled and sold to manufacturers of furniture, sash, doors and interior finish, who cut them to the lengths required for their work. They are used in place of metal to hold joints together and are often threaded. The dowels are driven into holes bored in the wood and are held in place by glue. Large quantities are used in Canada and there is also a large market for dowels in England. Birch forms the bulk of the dowels made in Canada at the present time, but beech is also used to a great extent. Coopers' pegs and tree nails for ship building are manufactured in a similar manner to dowels. The uncut dowel rods are often made into coops for poultry.

Numerous Miscellaneous Uses

Beech lumber has many miscellaneous uses which do not consume large quantities of wood, but are useful as suggestions for waste utilization. Wooden shoes are used in America in greater quantities than most people imagine. They are used by men employed in damp places such as tanneries, breweries, bakeries and laundries, as they are light and waterproof. Leather shoes with wooden soles are used in steel mills and glass factories to protect the workmen's feet from the hot floors. Most of this wooden shoe material is beech, as the closeness of the grain of this wood, and its density, fit it particularly for the purpose. Clothes pins are made almost entirely of beech and birch. Their cheapness is due to the perfection of the machinery used in their manufacture, which is practically automatic. The rough ma-

terial is fed into a hopper and the machines turn the pegs, cut out the slots and polish the finished article with soapstone in large cylinders, with practically no handling whatever. Bobbins used in textile factories are made of beech and birch and are also manufactured by specialized machinery. Most spools are made of birch, but beech is often employed for this purpose to advantage. The wood is harder than paper birch and does not hold its shape quite so well, but it turns smoothly and is easily polished. Spoolwood in the form of bars from 1/2-in. to 2 9/16-in. square and from 2 1/2 to 4 feet in length is purchased by spool manufacturers, and must be clear stock free from all defects. The wood in Quebec is cut in winter and sawn to size in small mills where the spoolwood is piled in open piles for thorough air drying. It is usually shipped early in the following summer to the spool factories. The machinery is very complicated and highly specialized.

Other miscellaneous uses for this wood are in the manufacture of whip stocks, umbrella handles, wooden spoons and bowls, rulers, shuttles, bails for pails, barrel bungs and faucets, coat hangers, hames and pulley blocks.

Beech is a slow growing tree like yellow birch and maple, but grows to an advanced age. Its seeds, however, are heavy nuts which are not carried by the wind like the seeds of birch and poplar. Heavy seed years occur only at long intervals so the reproduction of this tree is not very rapid. The smooth heavy bark resists fire and the tree is not liable to attacks of either fungus or insect. The tree is shade enduring and can thrive under the shade of others. In close stands it develops a long straight trunk free from branches, as is shown in the illustration. It is not likely that this tree will ever be a commercial possibility from the standpoint of forest planting after the present supply is exhausted.

Sasgen Derricks and Winches

The handling of lumber manufacturers' stocks by derrick and hoist has reduced the cost per thousand greatly and has effected an important saving in time and labor. The Sasgen Derrick Company, 13 Jarvis street, Toronto, are patentees and manufacturers of lumber derricks and winches of the most practical and up-to-date type. These derricks are all fitted with steel and malleable castings which make the machines light, at the same time adding materially to their strength. The Sasgen Peerless circle swing steel derrick is claimed by the makers to be the most practical and convenient derrick for hoisting building material of various kinds. It is a full circle swing, portable steel derrick with self-lubricating bearings, folding mast and bottom, and can be used by hand, horse or power without changing the boom.

This progressive firm also manufactures single and double drum geared winches, which are made from malleable and crucible steel, including gears, and are equipped with band brakes, the double drum having a special lever for shifting pinions into or out of large gears, by which means both pinions are worked simultaneously.

The Sasgen Derrick Company will ship these machines to reliable or rated lumbermen on trial. A special illustrated pamphlet and price list will be mailed upon request.

Dominion Timber Cutting Regulations Altered

The timber-cutting regulations in the Provinces of Manitoba, Saskatchewan, Alberta, and the Northwest Territories and parts of British Columbia have been amended by order-in-council issued by the Dominion Government. As a result of the new regulations licensees are now required to pay the following dues on timber cut on licensed berths: Sawn lumber, 50 cents a thousand b.m.; lath, 15 cents a thousand; shingles, 15 cents a thousand; piling and cribbing, 1/2 cent a lineal foot; railway ties, 8 feet long, 1 1/2 cents; railway ties, each foot over 8 feet long, 1/4 cent; shingle bolts cut within the British Columbia railway belt, 25 cents a cord; cordwood, 15 cents a cord; and 5 per cent. royalty dues on all other products of manufacture not enumerated; none on slabs or sawdust, however. Saw logs cut in Manitoba, Saskatchewan, Alberta, the Northwest Territories and the Peace River tract, British Columbia, on Crown lands, shall be paid for on the product of manufacture thereof and those cut in the British Columbia railway belt on the feet board measure according to British Columbia log scale. The new regulations also provide that permits may be issued by the Minister of Interior in Manitoba, Saskatchewan and Alberta and the Peace River tract in British Columbia, to owners of portable sawmills.

Mr. Arthur E. Foulds has just opened a sales office in the Canadian Bank of Commerce Building, Brantford, Ont., as manufacturers' sales agent. He will carry a line of building materials, specialties and contractors' equipment. The experience with building supplies which Mr. Foulds has already had places him in a position to give good service, he having been for the past ten years on the executive of the Schultz Bros. Company, large contractors, of Brantford.

Splendid Growth of a Young Concern

Long Lumber Company, of Hamilton, Ont.,—Founded on St. Patrick's Day Ten Years Ago—
Turned Over Thirty-Five Million Feet Last Year

Guy H. Long, Hamilton, Ont.

Ten years ago, on the 17th of March, there was started at Hamilton, Ont., in a very modest way the foundation of the business now known as The Long Lumber Company, the founder being Mr. Maurice S. M. Long, whose untimely death in May, 1910, was deeply regretted by the whole lumber trade of the country. From this modest beginning, on St. Patrick's Day, the company has grown year by year, until to-day it occupies a prominent position in the Canadian lumber world. In 1913 the turnover of the company was over thirty-five million feet, the business having doubled itself during the past five years. The Long Lumber Company are wholesalers in white and red pine, hemlock, spruce, birch, yellow pine and cypress, shingles, lath, cedar posts and

and "Klimax" doors. They handle the complete output of several large mills including that of the Standard Chemical Company, of Longford and South River. The trade mark of the firm "The Bull Dog" is now widely known and stands for reliability, prompt shipment and quality.

The successful growth of the business has been due to Mr. Guy H. Long who is one of the best known men in the Ontario lumber trade. Mr. Long was born in 1881, and is the son of the late George Long, who, for many years conducted a successful coal and wood business in the city of Hamilton. After a preliminary education, he attended the Canada Business College from which he graduated at the age of 15. Shortly afterwards he obtained a situation as a junior in the office of a Hamilton lumber company. After receiving a grounding in business methods with this company, he sought to extend his activities and entered the wholesale lumber business. When seventeen years of age he was sent out upon the road. During this work he saw much of the lumber industry in Ontario. His ground was the Northern division and the majority of his larger customers were lumbermen. During the early part of 1905 he abandoned the road when the Long Lumber Company was formed, and entered into partnership with his brother the late Maurice Long. On the death of the latter in 1910, Mr. Long took into partnership Mr. Frank Burton, who, for several years previous had been in their employ. Mr. Burton may possibly be better known to the Ontario public as "Dutch" Burton, so prominently connected with football activities and captain of the Tigers Football Team in 1913.

In addition to his connection with the Long Lumber Company, Mr. Long is also president and principal owner of the Consumers Lumber Company, Limited, of Hamilton, which does a large retail lumber business in that city. He is also vice-president of the Vincent Company of South River; director of the Barton Binbrook Telephone Company; president of the Centennial Park Company, of Hamilton; president of the Ontario Basket Ball League Association, and is prominently connected with sports of all kinds, in which he finds time to take a keen interest.

The growth of the Long Lumber Company has been steady and sure. They commenced business with very little capital, but with conservative management forged ahead, extending their activities, until to-day they are covering the country with their travellers, and a staff of eight clerks, are kept constantly employed at the head office. On April 1st a change is being made in the staff and Mr. Roy Stewart who has been covering the Niagara district and Western Ontario will be located at the head office as sales manager; Mr. J. M. Donovan who has been for some time in charge of the Toronto office will take Mr. Stewart's territory and Mr. Geo. Wisner will take Toronto and Eastern Ontario territory. Mr. H. P. Brierley is the Hamilton traveller of the firm and Mr. R. Atkins is also working out of the head office.

To commemorate the tenth anniversary of the firm's inception Mr. Long is giving his employees a banquet at the Commercial Club, Hamilton, on St. Patrick's night.

Mr. Angus Carss, secretary-treasurer of the Carss Mackinaw Clothing Company, Limited, Orillia, Ont., manufacturers of lumbermen's and miners' clothing, left on a business trip to Western Canada on March 7th. His trip will take him through to Prince Rupert by way of Vancouver and he will return by the Grand Trunk Pacific, stopping at all the main points along that line.

A report from Quebec states that the outlook for the export business with Great Britain during the present year is encouraging. The same applies to the trade with the United States. An increased demand is already indicated and prices show some improvement. The English market is more active and ocean freight rates are lower.

F. R. Burton, Hamilton, Ont.

H. P. Brierley, Hamilton, Ont.

J. M. Donovan, Toronto, Ont.

Roy Stewart, Hamilton, Ont.

An Urgent Situation in the North

Fallen Timber in Mississauga Reserve Should Come Out at Once—A Railroad Would Simplify the Difficulty

Editor Canada Lumberman: Thessalon, Ont., March 14th.

Probably some of your readers are not aware that there lies some 50 miles north of the North Channel of Lake Huron an immense timber reserve, known as the Mississauga Forest Reserve, about two million acres in extent and estimated to contain from one to two billion feet of white pine timber, some of it, the finest on the continent. It is almost beyond doubt that 30 per cent. or more of that vast timber wealth was blown down by the great storm of November last, the same storm which caused such terrible disaster on the lakes.

The forest reserve is drained by the Mississauga river and tributary streams, affording ample facilities for getting this fallen timber out to the market; but there are no facilities whatever for getting supplies and outfit into the reserve, to carry on the operation of lumbering. It is also well known that the life of a blown down pine tree is limited under favorable conditions to two years. As soon as the action of the rains and the sun's heat and frost separate the earth from the roots, the tree becomes a prey to the borer, and is soon rendered of no value whatever. It is also true that the dead tops of such a large percentage of fallen pine make the best kind of material for forest fires, and if a fire once started in the reserve, with 30 or 40 per cent. of the pine tops down and dead, all the fire rangers in America could not stop it. Not only the fallen timber, but the standing timber as well, would become a prey to the flames, and that whole vast asset of nearly two billions of pine timber would become a total loss.

This is not a remote possibility, but is a near probability, and unless something is done at once to get a railway to that reserve next summer, the Province of Ontario is likely to lose between five and ten million dollars. Take the conservative estimate of the timber at one and a quarter billion feet; as matters stand to-day it could not be sold to lumbermen for perhaps more than \$1 per thousand feet stumpage in its entirety. With the advent of a railway the value of it would be increased to say \$6, or more per thousand, which for one and a quarter billion feet would mean over \$7,000,000.

A steam railway could be built 50 miles for say \$30,000 per mile average or one and a half million dollars, which would leave the government a net profit of five millions. But, as the railway at the outset would be required mainly for getting supplies, outfit and men into the reserve, an electric railway would serve the purpose, and, by avoiding heavy grades, etc., could be built for probably \$10,000 per mile, costing half a million dollars, thereby saving to the province over six million dollars, a very tidy sum indeed to develop our great resources. For an electric railway there is abundance of electrical energy available at either the Grand Falls, Squaw Chute or Aubrey Falls, on the Mississauga River, along the route on which the railway can be most cheaply constructed.

The traffic of such a road would not be confined to passengers and supplies alone, but its very existence would develop a traffic equal to any other road, as it is a well-known fact, that Gould Township promises to be, and is believed to be as rich in copper and gold as Sudbury is in copper and nickel, while a vast area of iron claims further up the Mississauga lie waiting development as soon as shipping facilities are available. Add to this the hundreds of millions of hardwood, both in the reserve and in the townships between us and the reserve, into which small mills may go, to convert this hardwood into lumber, and we already have promise of immense development once a railway is built.

In addition to the pine and hardwood, there are other woods, such as spruce, Norway, balsam, and white birch to which the railway will add a market value, and which will also be a loss in the event of the reserve being fire swept.

The policy of the government has been to conserve that great timber wealth for the future needs of the province, and, until recently, this policy was looked upon as wise and sound, but conditions have changed since the storm occurred, and the policy of the government must change too, so far as this timber is concerned. I am told that the Department of Lands, Forests and Mines has called for tenders on some of the blocks of timber in the reserve and the bids have been so ridiculously low they could not be accepted. There can be no other reason for this but the lack of transportation facilities. Let the government announce that a railway will reach the reserve by the fall of 1914 (and this can be accomplished) and with that announcement call for tenders for some of the pine, and I venture to say that the advance in the offers on two or three of the six-mile blocks of pine will be sufficient to build and equip the railway. The lumbermen need the pine. The province needs the money and cannot afford to risk the loss of so many millions of dollars, and this north country needs the railway. If ever there was a time when the Government of this province was justified in building or assisting a railway, the time is now,

and every month's delay will add to the risk of the loss of millions of dollars to this province.—Yours truly, J. B. Dobie.

Shooks for the Yard Trade

There are many opportunities that are missed by the saw mill man when he turns his thoughts to box shooks and crates, simply because he forgets, for the time being, all about the retail dealer in lumber and the jobbing planing mill man in the country towns, says The St. Louis Lumberman. There is really a chance to develop quite a shook trade with the yards and planing mills, some of it in rough lumber and some of it in finished stock.

To begin with, the yard man in the community may be able to develop some shook trade with shippers in his territory. This is a point that has been made before in these columns. Then there is another point: There is a lot of stuff used by builders that might well be cut into specific dimensions which would make it properly shook trade. Such stock as bridging, banisters, shorts in flooring and ceiling, step stuff and risers in single lengths, and a multitude of items of this kind which, by as much effort at study and development as is given to the box and crate trade outside, might be made to yield even better returns herein.

Incidentally, the planing mill man, if he is encouraged to do it, may use short lengths of rough material in the same way.

Take the matter of single lengths in step stuff and risers, for example. The first thing the average mill man will likely raise the point of uncertain length. Yet, he has to confront that same uncertain length in the getting out of longer boards for step stuff, and, often, the lengths will not cut the board to advantage.

Still, a careful study of the work in the community will enable the local dealer to establish certain standard lengths in steps and risers, lengths that are used regularly enough that he may well stock up on them. Once he has established two or three standard lengths, this gives an opportunity to get the stock made up and to utilize short lengths in the making.

Where the planing mill man buys stock in short lengths and makes it up in this way, he can not only run the nosing on one edge of the board, but he can square off and extend the nosing on the ends, and thus have a finished step which he can sell to the builder at the same price he would have to charge for the step stuff with simply a nosing run on one edge—and it would prove a convenience that the average builder would appreciate.

For the yard trade, the millman can put up finished steps and risers himself. Lots of this stock can be worked in short lengths from a lower grade material that he could not ship in full length to the market. And while it will never be possible to take care of the entire trade in this way, it is practical to develop quite a volume of business in small dimensions of various kinds in special stuff, properly shooks.

To accomplish this is more a matter of salesmanship, and of educating the dealers and the public, than anything else. This should not be much of a handicap, because the wide-awake mill man must send his salesmen on the road, and it is no more trouble for him to develop this special dimension stock trade among the yards and planing mills than it is to develop a shook trade among the users of packages.

In truth, it should be easier, because there is less competition. It is virtually new ground; ground that, when properly cultivated, should yield good returns with very little opposition and very little battling over the matter of getting a price that will net some good returns and, at the same time, enable the mill man to clean up a lot of stock that he is in the habit of looking toward the box and crate trade to take care of.

Crown Land Pulp and Paper Will Enter United States Free

That wood pulp and paper made from pulpwood cut on the Crown Lands of Quebec upon which the provincial restrictions were removed is entitled to entry free of duty under Section 2 of the Reciprocity Act was the ruling made recently by Judge Somerville of the Board of United States General Appraisers in the protests made by the Laurentide Paper Company, William A. Bird, the Central Vermont Railway and the Laurentide Company. The attorneys for the Government advanced the contention that the restrictions were removed on the basis of a contractual agreement between the paper mills in Quebec and the Province of Quebec. Louis Armstrong, treasurer of the Laurentide Company, as a witness denied such an agreement had been made, and also that the order-in-council granted on December 31, 1912, prohibited the export of pulp wood and that the release of the Crown Land restrictions was made only on the promise not to export the pulpwood, but to give the province the sole benefit of the use of its natural resources. On the strength of this testimony and statements of a similar nature by other witnesses Judge Somerville sustained the protests of the importers and the collector is ordered to reliquidate the entries.

A Prosperous Bracebridge Industry

How George Tennant Developed a Large Business from Small Start in Face of Many Obstacles

Geo. Tennant, Bracebridge, Ont.

The days when it was possible for a man to go into the business of manufacturing lumber and to make such a profit as to become "a millionaire lumber king" in the space of a few short years, may have passed, in Eastern Canada, as so many lumbermen now declare. On the other hand it is possible to-day, to go into the lumber manufacturing business in a small way and, with energy and ability, work up a successful business with reasonable certainty. The industry in Ontario is, in fact, remarkable for the number of small manufacturing companies which have started out moderately, being content during the early stages with a moderate amount of success, and which a few years later have developed into large industries paying good profits.

An example of this sort of success is found in the case of the business carried on at Bracebridge, Ont., by Mr. George Tennant, a business which started out a few years ago with much to discourage the owner, but which has developed gradually into one of much importance to the town of Bracebridge in which it is located, and promises to become a much more extensive industry in the near future.

A Short But Interesting History

The history of this business is short, but none the less interesting. The sole proprietor and manager is Mr. George Tennant, whose portrait is published herewith and who went to Bracebridge, from Hepworth, in the county of Bruce, nineteen years ago, to work for the firm of Ford & Gillespie. With this firm he had his first experience of sawmilling and occupied the position of head sawyer. This position he held for two years, until the firm dissolved partnership and Mr. Gillespie took over the business. George Tennant had given such satisfactory service to the firm that Mr. Gillespie engaged him to continue, and for two years more he was in charge of the sawing operations, also taking full charge of the mill in summer and the scaling in the woods during the winter. At the end of four years at Bracebridge he found himself with a fine practical knowledge of the work of sawmilling, the management of woods operations and the conducting of the business end, in the way of finding markets for the product. It was only natural that, when Mr. Gillespie became dissatisfied with the business, George Tennant should have been the man to take it over and carry it on successfully. This was the opportunity for which he had been preparing himself for several years. Mr. Gillespie proposed that he should take over the business for himself and, after giving the matter a good deal of thought, he decided to do so.

This was George Tennant's first venture into business on his

own account and the proposition was one which might have made other men hesitate, as the former owner was not pleased with the outlook. George Tennant, however, having decided to take over the business, at once started in to make it a success. To purchase the mill and his first stock of logs, all he had in the way of money was \$200, not much to start with, but just sufficient to indicate to the banks that he was a man who might be expected to make a fair profit, if given a little encouragement in the form of credit. The result was that George Tennant secured credit to the extent of \$4,000, which he invested in logs. Mr. Gillespie, the former owner of the mill, was content to allow him a year in which to make payment for the mill, thus, with a heavy burden for a man whose capital was only \$200, but with a large fund of courage and determination, Mr. Tennant commenced operations on his own account. That he was fully justified in placing confidence in himself and in borrowing the money to finance his undertaking, is illustrated by the fact that in the fall of the same year, after the first season's operations, he found himself the owner of \$5,000, after paying both the bank and Mr. Gillespie; a truly remarkable record. The next year he turned out about the same quantity of stock and met with similar success.

Plant Swept Away by Fire

The business went along in this way for a few years and Mr. Tennant was well on the road towards business success in a larger way, when, in the spring of 1902, after the mill had only been running about two days, fire broke out in the plant about midnight and swept away everything. The loss was \$5,000 and the insurance \$1,800. The blow was a heavy one and Mr. Tennant, for a time, was at a loss what to do. Two alternatives presented themselves; to rebuild the mill, or to sell the logs which he had on hand and go back to work in someone else's employ. He was inclined to take the latter course at first, as he had no timber limits of his own and depended upon the logs he could buy. The quantity of logs available on the river (north branch of the Muskoka) seemed to be getting smaller each year. Mr. Tennant, however, had had sufficient taste of the advantage of being in business for himself to make him lean towards rebuilding the mill. After some consideration, this was the course he adopted. He put up a new mill on the same site. With three other men, he set to work and had the mill up in time to cut out his stock of logs the same fall. The result was that he lost very little in the way of business and was soon back upon his feet once more. During the next year he ran the mill with just about the same success as formerly.

For six years more he operated the mill with equal success, before making any further change. Then there came a time when the Bracebridge Furniture Company went into liquidation and offered their plant for sale. Mr. Tennant felt that he could make a success of this business also, and he bought the plant and moved his sawmill over close to it. This he did in order to save drawing the lumber a distance of about one mile to the railway.

Each year, since moving to the new site, Mr. Tennant has cut from one and one-quarter to two million feet and all of this he has always sold in block to the R. Laidlaw Lumber Company, Toronto, who have purchased his stock for the last twelve years.

Mr. R. A. Oughtred, for several years in the lumber business at Marbleton, P.Q., has opened offices in the Premier Building, Sherbrooke, P.Q., making a specialty of spruce and hemlock timber, hardwood, pine and pulpwood. Mr. F. W. Johnson, who was formerly with the Dudswell Lumber Company, is in charge of the office staff.

George Tennant's Plant at Bracebridge, Ont.

Timber Production on Dominion Lands

Department of Interior Report Gives Interesting Statistics of Output and Sales of Crown Timber in the Western Canadian Provinces

The annual report of the Department of the Interior for the fiscal year ending March 31st, 1913, contains reports of the Crown timber agencies at Winnipeg, Edmonton, Calgary, Prince Albert, New Westminster, Kamloops and in the Yukon. The timber revenue of the Department for the year amounted to \$434,196.60 and was made up as follows:—Bonus, \$33,272.93; rental, \$73,126.90; royalty, \$154,859.12; permit fees, dues, etc., \$154,487.73; seizures and fines, \$18,449.92.

The revenue derived from timber and grazing lands received at the Crown Timber Agencies, together with the ruling price of lumber, the number of mills operated on berths held under license, and the number of portable sawmills in operation, may be summarized as follows:—

	Total Revenue	Average price of Lumber per M ft. B.M. at Mills	No. of mills operating under license	No. of portable mills in operation
	\$ cts.	\$ cts.		
Calgary	26,392 55	17 13	19	21
Edmonton	35,980 45	16 67	24	46
Prince Albert	63,693 37	18 29	4	16
Winnipeg	93,457 45	16 83	27	31
New Westminster	58,528 30	14 50	11	..
Kamloops	71,662 08	13 79	7	..

The returns of operations received show the following quantities of building material as having been manufactured and sold under Government license during the year in the timber agencies above referred to:—

	Manufactured	Sold
Sawn lumber, ft. B.M.	329,469,767	315,917,874
Shingles	49,876,315	49,901,315
Railway ties	342,138	342,138
Laths	48,372,389	51,987,702

The following material was manufactured and sold on permit berths and portable sawmill berths:—

	Manufactured	Sold.
Sawn lumber, ft. B.M.	46,259,635	53,703,666
Railway ties	165,908	165,908

The areas of timber lands held under license and permit in the provinces of Manitoba, Saskatchewan and Alberta, and in the Railway Belt in the province of British Columbia, on March 31, 1913, were as follows:—

	Under License Sq. Miles	Under Permit Sq. Miles
Manitoba	1,303.20	635.01
Alberta	2,167.68	40.73
Saskatchewan	2,107.70	289.74
British Columbia	1,797.80	5.30
Total	7,371.38	970.78

The inspector of Crown Timber offices at Winnipeg reports that at the end of the year the stock of logs on hand cut from Crown Lands in the four western provinces totalled 5,437,902 pieces, each would produce in the neighborhood of 350,000,000 feet of lumber. There were 124 berths under permit in the Winnipeg agency during the year, as compared with 107 during the previous year.

The total sales of lumber in the provinces of Manitoba, Saskatchewan and Alberta during the year, together with figures for the previous year were as follows:—

	Ft. B.M. 1912-13	Ft. B.M. 1911-12
From British Columbia Mills (Provincial Lands)	623,325,362	617,674,621
From Western Ontario (Pine)	130,000,000	150,000,000
From United States (Free)	256,000,000	236,000,000
From United States (Dutiable)	55,000,000	47,000,000
Manufactured at Mills in Manitoba, Saskatchewan and Alberta (Spruce)	241,946,902	156,110,144
In Railway Belt British Columbia—Dominion Lands —(Fir, Cedar and Hemlock)	127,574,638	74,325,379
	1,433,946,902	1,281,110,144

In addition to the lumber shipments from the United States there was imported 72,723,000 lath and 89,287 thousand shingles, while there was exported, going to Chicago, 5,183,000. No. 2 spruce lath, upon which a duty of twenty cents per M. is collected, the American product has free entry into Canada.

The figures given as to quantity of spruce and tamarac lumber sold during the year by mill men operating in the Prairie Provinces can be relied upon as accurate, as they are compiled from their sworn returns. The other figures were secured from official returns and from the two Associations (Wholesale and Retail) representing the lumbermen in the West, and can, I feel, be accepted as being nearly accurate.

I am informed that, as a result of improved conditions in the United States lumber market, very little of the American product is, at present, being shipped to Western Canada. Owing to this fact, prices here have advanced and are higher than for some years past.

It is confidently expected by the British Columbia lumber manufacturers that, with the opening of the Panama Canal, a great impetus will be given to the export trade, and that a profitable market for their products will be found at Atlantic ports in North and South America, and that the export trade to Great Britain and Europe will improve.

The matter of utilizing the waste products at the mills in a profitable manner is receiving the earnest attention of the lumbermen, and experiments are being made with that end in view.

Very little damage was done to standing timber during the year by fire. The rainfall in the West was heavy and came at the danger season.

Manitoba Operations

The report of the Crown Timber Agent at Winnipeg shows that 49 sawmills were operating under government license in his agency during the year, cutting almost entirely spruce and tamarac. Total production was 63,390,156 feet B.M., of which 62,962,952 feet B.M. was sold.

The log production in connection with these mills was 1,056,896 pieces and the stock manufactured amounted to 1,198,097 logs. At the conclusion of the year these companies had on hand, 1,009,064 logs. The lath production of these mills amounted to 17,224,617 pieces and sales amounted to 16,967,750 pieces. The same mills also produced 88,390 railway ties and sold 101,982 railway ties. The shingle production was 50,000 pieces and shingle sales were 75,000 pieces.

The Crown Timber Agent at Edmonton reported receipts for the year amounting to \$135,980.45. There were 48 mills operating under Government license in this agency during the year, which turned out 14,871,777 feet B.M. of lumber and sold 15,046,525 feet B.M. The log production in connection with these mills amounted to 378,267 pieces and the logs manufactured amounted to 250,650 pieces. Logs on hand at the end of the year totalled 256,996 pieces. These mills manufactured 196,663 railway ties and sold 197,481. They also manufactured 3,375,252 lath and sold 3,192,702 lath. Their shingle production was 110,750 pieces, and their sales were the same amount. The average price of lumber per M. feet in connection with these mills was \$16.39. The same mills also manufactured 82,980 feet of piling and sold 16,820 feet.

Operations in the Calgary District

The Crown Timber Agent at Calgary reported that the quantity manufactured from licensed timber berths during the twelve months was 23,602,764 feet B.M. and the quantity sold 21,818,275 feet B.M. Mills under permit in this agency manufactured 4,406,796 feet and sold 6,652,283 feet. The total quantity of lumber on hand at these mills at the end of the year was 15,983,231 feet. In addition to the 28,009,560 feet B.M. manufactured, the report says that probably about 100,000,000 feet was brought into the province from British Columbia and 10,000,000 feet from the United States. The average price of lumber from both licensed and permit berths during the year was \$15.65.

The Crown Timber Agent at Prince Albert reported that the sales of lumber manufactured under license in his agency amounted to 110,271,719 feet B.M., an increase of 62,755,098 over the previous year. The average price of this lumber was \$18.29, a decrease of \$1.16 per M. feet B.M. The quantity of lumber manufactured under license was 121,786,667 feet, an increase of 44,317,072 feet. The quantity on hand at the end of the year was 47,314,398 feet. The cut of logs in connection with these mills was 1,708,039 pieces, whereas 2,143,606 logs were manufactured and these companies had on hand at the end of the year 2,651,326 pieces. The same companies produced 25,658,420 shingles and sold 29,760,200.

In the New Westminster agency the timber production totalled 39,114,801 feet B.M. of saw logs, 13,781 cords of shingle bolts, 82,328 lineal feet of piling and poles, 29,904 pieces of railway ties, 1,000 fence

posts, 1,239 cords of wood. The mills under license in this agency cut 23,695,365 feet B.M. and sold exactly the same quantity.

In the Kamloops agency, mills operating under license manufactured 82,123,038 feet B.M. of lumber from 674,329 logs.

A summary statement of the operations on Dominion timber berths under license for the year ending March 31, 1913, shows the following totals:—

Lumber, manufactured 329,469,767 feet; sold 315,917,874 feet; on hand 95,095,892 feet; lath, manufactured 48,372,389 pieces; sold 51,987,702 pieces; on hand 9,394,972 pieces.

Shingles, manufactured 49,876,315 pieces; sold 49,901,315 pieces; saw logs, cut 4,367,141 pieces; manufactured 4,858,101; on hand 4,943,088.

The timber cut under permit totalled 46,259,635 feet and the sales under this head amounted to 53,703,666 feet.

British Columbia's New Pulp Lease Regulations

The amendment to the forest act of British Columbia, which extends the present facilities for selling timber in small quantities and gives a longer tenure to pulp leases was recently given its second reading in the legislature and Hon. W. R. Ross, Minister of Lands explained the various provisions of the proposed bill. Hon. Mr. Ross remarked that the administrative work of the Department had been organized during the past twelve months for each of the eleven forest districts, and a permanent local staff had been provided for these districts, which had enabled the Department to undertake greatly increased amounts of forest work. A record revenue had been collected in spite of the severe financial stringency. An excellent showing had been made in forest protection last summer. He had no amendment to propose in connection with the protection section of the act. The tax of one cent and a half per acre for the protection fund had proved sufficient. During the year, nearly \$100,000 had been devoted to the construction of permanent improvements and there was a handsome surplus on hand for the work of the present year.

An amendment was now proposed, he said, to simplify the provision for small timber sales. This amendment would permit of sales being carried out without the delays consequent upon correspondence with Victoria. Whenever possible, it was proposed to substitute small timber sales for the out-of-date procedure of issuing hand-logger licenses. Small sales would give the enterprising hand-logger, whose license at present forbids the use of steam machinery, an opportunity to work up in the business.

Speaking of the proposed amendments to pulp leases, Hon. Mr. Ross said that British Columbia's vast areas of pulpwood timber and her abundance of water power offered remarkable opportunities. So far, however, her share in the pulp industry had been very small. The pulp industry was one which utilized timber that would otherwise go to waste under the destructive methods of present day lumbering. Moreover it was an industry which employed white labor and created new settlements. He believed that it was reasonable, therefore, to extend the existing pulp leases so as to provide definite tenure for a period of time, sufficient to justify the heavy investment of capital involved in the erection of modern paper mills. He believed that the co-operation of the government in making possible the extension of the leases would bring into the province in the next few years many millions of dollars of additional capital and that the industry would soon be firmly established.

Pulp and Paper Association's Annual Meeting

Questions affecting tariff classifications, trade customs and methods, and statistics of production were discussed at the annual meeting of the Canadian Pulp and Paper Association, held in Montreal on February 26th. Mr. Carl Riordon presided. A paper on the classification of paper for customs purposes was read by J. R. K. Bristol, while Mr. E. S. McPhail discussed "The Value of Statistics." After Mr. Howard Smith had read a paper on trade customs, a motion was passed asking the executive to draft trade customs for the trade as a whole. The question of the proposed new carload minimum was considered, but no action taken.

Plans were proposed with a view to increasing the membership of the association. For the ensuing year the following will hold office: President, Mr. Carl Riordon, Montreal (second term); vice-president, T. H. Weldon, Toronto; executive committee—Mr. C. Howard Smith (Montreal), F. H. Gage (Toronto), G. M. McKee (Quebec), F. H. Ritchie (Toronto), T. J. Stevenson (Montreal), K. L. Warren (Riviere du Loup), H. Crabtree (Crabtree Mille).

In the evening the members dined at the Windsor Hotel, Col. Hugh Clark, M.P., being the chief speaker.

It is proposed by the Newfoundland Government to impose a royalty of one dollar per 1,000 feet of lumber cut by small mills, which at present contribute nothing to the revenue. This is estimated to bring in \$25,000.

Air Seasoning of Timber

Proper seasoning of timber is conceded to have an important bearing on the strength and durability of the timber, whether or not it is subsequently treated. Data as to the right length of time for air seasoning have been assembled by Mr. William H. Kempfer of the Forest Products Laboratory at Madison, Wis., who presents the results of records kept on many lots of timber of different kinds, cut in various localities and seasons. From the tables and curves given, Mr. Kempfer draws conclusions which are abstracted below.

The accelerating effect of warm, dry weather on the rate of evaporation and the retarding effect of cold or wet weather were seen very plainly in those seasoning tests which were started at different times of the year, and also in tests where the weighings were continued from one summer through the winter into the succeeding summer. Timbers which had become fairly dry ceased to lose moisture, or even gained weight, during the wet or cold, damp weather; but timbers cut in the unfavorable periods showed a moisture loss during subsequent unfavorable weather, and by the time of the warm, dry weather they had so far seasoned that the rate of loss was fairly constant throughout both periods.

The effect of climatic variations in the different places where the tests were made was less, on the whole, than the effect of the changes in a given locality throughout the year. Each locality had its favorable and its unfavorable periods. Although direct comparisons of climatic effects cannot be made because different species were studied in the different localities, the effect of hot, dry and long summers is marked.

By considering the effect of time of year on rate of seasoning, timber may be cut at such time as to obtain either slow or rapid drying. When timber is cut in one part of the country to use in another part, climatic conditions should also be taken into account. Thus in the case of a timber-treating plant drawing supplies from different parts of the country, it would be worth while to consider whether the timber should be held for seasoning at the plant or in the locality where cut.

Species and Form

Variations in the rate of seasoning among species may be due to differences either in moisture content or in permeability of the wood. Of two pieces of wood differing in moisture content, other conditions being equal, the one with the more moisture will dry the more rapidly, and in a comparatively short time both pieces will reach about the same condition. This rule does not apply strictly between different species, but with conifers the usual variation between the species does not seem sufficient to necessitate separate treatment.

Sapwood of the conifers contains, as a rule, much more moisture than does the heartwood, and a difference in the proportion of heartwood and sapwood in two timbers of the same species accounts for a large part of the difference in moisture content. But sapwood loses moisture more rapidly than the heartwood, and this tends to equalize the time required for the two pieces to become air dry. Furthermore, so far as the data presented afford a basis for comparison, ties of different coniferous species, all seasoned under the same conditions, usually differ much less in time required to become air dry than in amount of moisture lost.

The size of the piece influences the time required for seasoning, because it affects the relation of the volume of a timber to its surface area and the distance which the moisture on the interior must traverse to escape from the surface. This influence, however, is not as great as might be expected. Shortleaf pine in 5 x 8-in. beams contained only three per cent. less moisture after fifteen months' seasoning than those 8 x 12-in.; 7 x 9-in. redwood timbers contained three per cent. less after three years than those 8 x 16 in., and the 3 x 14-in. size contained three per cent. less than the 7 x 9-in.

Manner of Exposure

The extent to which timber is exposed to atmospheric influence has an important bearing on the evaporation of moisture from its surface. The exposure is affected chiefly by the manner of piling the timber. If weather conditions are favorable isolated piles permit rapid seasoning, however closely the ties are stacked, but if the piles themselves are crowded together the influence of the form of pile undoubtedly becomes more pronounced.

The combined effect on the rate of seasoning of close piling of ties and retention of their bark is indicated by tests made on hemlock. Ties that had been piled solidly with the bark on weighed 40 lb. per cubic foot at the end of one year. The average weight of peeled hemlock ties in various isolated piles seasoned for one year ranged from 36 to 38 lb. per cubic foot and was usually less than 37 lb.

Attempts to determine the effect of the position of piles with regard to wind direction showed negligible results.

Site has an important effect on seasoning. Chestnut poles in Maryland which were fully exposed to sun and wind lost 25 lb. per pole more in ten months than others partly protected by a hill and surrounding trees; and poles skidded over dry ground lost 35 lb.

more per pole in eight months than others skidded over ground which was wet and covered with rank vegetation.

In tests to determine whether seasoning of timber may be facilitated by soaking it in water, it was found that timbers which had been soaked for short periods, upon removal from the water, lost the extra moisture so fast that they soon reached practically the same condition as similar timbers not immersed. Whether the soaked timber ultimately reached a lower moisture content is still open to question.

Deterioration While Seasoning

Complaint is often made that timbers of certain species, such as the soft pines, the gums, beech and maple, will decay before they will season. It is believed that this can be prevented usually by piling the timbers so as to dry rapidly. The tree should be barked as soon as felled, and the timbers piled openly. Injury by insects may be prevented in the same manner.

While quick seasoning prevents injury by decay and insects, it is not always necessary nor desirable. Timber cut and set drying in hot weather checks more seriously than in cold weather, and sometimes becomes "case-hardened" and very resistant to preservative treatment. Timber cut in the late autumn or winter seasons more slowly and evenly; if peeled and properly stacked, or skidded off the ground, it dries enough before warm weather to resist attack by insects or fungi. But whatever the time of cutting, careful attention is needed in piling the timber, either more openly or more closely, according as local climatic and other conditions are found to require.

It is frequently stated that wood cut during the winter when the "sap is down" is of better quality or more durable than that cut when the "sap is up." These effects must be attributed very largely to external conditions rather than to internal conditions of the tree before it is felled. Moreover, contrary to popular belief, a tree contains as much sap in winter as it does in summer.

Degree of Dryness Attainable

The term "air dry" has heretofore been used as a matter of convenience to indicate the lowest moisture condition reached by the various timbers. In most cases, further losses would have occurred if the tests had been continued. Such losses, however, especially with large timbers, are so gradual after the greater portion of the moisture has been evaporated that it is impossible to fix any particular moisture per cent. to be designated "air dry."

The drying of wood is accompanied by a shrinkage of its volume which begins usually when all water has been evaporated from the cell cavities, and the cell walls themselves begin to dry out. When this condition is reached, the moisture content is, as a rule, less than 30 per cent. The moisture content in a large stick is not evenly distributed, however, and the outer portions dry first, so that some shrinkage occurs almost as soon as seasoning begins. Partial air seasoning has very little effect in preventing the subsequent shrinkage of timbers, and complete air seasoning is not sufficient if the wood is later to be subjected to further drying, as by use in artificially heated structures. Shrinkage is nearly twice as great tangentially as radially. Longitudinal shrinkage is so small that it may be disregarded.

Cost Accounting in the Sawmill

Determining the cost of production of a given grade of lumber is a problem which most sawmill men have given up in disgust. As a matter of fact, it is an impossible proposition although in practice it must be treated, for purposes of bookkeeping if for no other reason, says the Hardwood Record. Though the method used be arbitrary, there is need for hitting upon one which will coincide with the facts as closely as possible.

There can be little doubt that there are many errors in keeping track of sawmill expenses and the cost of production of lumber. In fact, a large concern which operates a sawmill and appears to be fairly prosperous admits that its books show a loss of something like \$7,500 a year on its manufacturing operations, and that this is made up for only in the sales department. The figures are gotten by fixing a scale of prices, adopted several years ago, upon the output of the mill and comparing the total valuation of the lumber, appraised in this way, with the cost of production.

The fact that the concern can overcome this sizable sawmill loss after the lumber reaches the yard suggests that the scale of values used in appraising the product of the mill may be out of line. And yet the company believes that the figures are close enough to the market to warrant their use. If this is correct the mill is losing enough money to make investigation of its operations mandatory, although it is conceded to be well managed and to be operated efficiently.

Getting back to first principles, it is obvious that the actual cost of production of one grade of lumber is the same as that of another. Thus the only absolutely correct basis upon which to figure cost is

with reference to the log-run production. When it has been determined what the cost of manufacturing the lumber, log-run, is, a relation must be established between the values of the various grades to enable the sums of those values to equal the log-run total.

In other words, as a theoretical proposition, the millman must value his firsts and seconds, No. 1 common and No. 2 common lumber in such a way that when his production of those grades is figured at the end of a given period, their total will equal the cost of operating the mill. They will be a correct analysis of the cost of production, although, as stated, it can be only theoretical, and its correctness must depend upon the accuracy of the operator in fixing his arbitraries. These should be somewhere between the actual cost of production, on the one hand, and the market value, on the other, since to go outside of this range will immediately introduce error. However, if the arbitraries used are consistent, and the cost of production is greater than the value of the lumber thus turned out, there is evidently something wrong in the mill.

Another question which must be considered in connection with production costs is the value of the logs which are used. If the log buyer is successful in getting the timber at a good price, the profit shown by the transaction after the logs are delivered and graded should be credited to the log department and not to the mill; and on the other hand, a poor lot of logs should go into the mill at their actual value, even though a higher price was paid for them. Thus if a lot of logs is bought for a lump sum, they should be valued before being manufactured as a means of preventing either the skill of the buyer or his failure to secure good material from entering into the apparent results of the operation of the mill.

The production of given lots of logs should be determined, instead of manufacturing without knowledge as to the origin of the logs or attempting to check up the results of a given lot. There is a wide variation between the results of different days' work, some sawmill owners finding that it varies from as much as \$150 loss to a profit of that amount. It is likely that the large amount of the variation depends entirely on the variation in the character of the timber, since the varying efficiency of labor is not likely to make as much difference as that.

Since there is so great a difference in the kinds of timber, it seems to be desirable, if not necessary, to number logs and get a close tab on the results of manufacturing them. Thus if the output of a given lot turns out to be deficient, there will be a guide as to purchases to be made in that section in the future, while the same consideration applies to unusually good results. Certainly good and bad should not be mingled indiscriminately, the mill-owner thus depriving himself of the knowledge which may explain a good day's run or suggest the reason for a bad one.

A rather effective method of keeping a check on the sawmill is to pay it for manufacturing the same rate which is paid custom sawmills. It is assumed that the custom mills are making money, since they would otherwise not work for the price charged, and the mill of the owner is compelled to produce on that basis, and make a profit, or an investigation is undertaken for the purpose of finding out the reason why. This saves the necessity for much analysis, since no reference is made to the value of the lumber produced. The only requirement is that the gross income from the log-run production shall be sufficient to show a profit on the investment, depreciation and maintenance expense, plus the cost of operating the mill. If that is done, the result is satisfactory. If not, the inevitable leak in the mill is looked for.

It is conceivable that a mill might make a good showing in this way when it would fail to show a profit where the value of the lumber produced was figured against the cost of the timber and the expenses of operating the mill. In fact, the method has so many advantages that, as a solution of the problem of handling the cost of production, it is to be recommended, especially for the concern which does not desire to increase the amount of clerical work which is necessary for the operation of anything like a real system for determining this factor.

If one were able to figure averages based on say ten years' experience and the production of hundreds of hardwood mills, it might be possible to determine the proportion upon which to base the arbitrary values given various grades. That is to say, if the actual results of manufacture were shown, a sufficient quantity being figured to eliminate unusual cases, it could be told with fair accuracy how much of each grade a given quantity of logs ought to produce. Knowing the proportions of each, and the market value of each grade, the percentage of the total value of the log-run production to which each grade is entitled might be determined.

Establishing proportions of this kind would be difficult, however, particularly as the character of timber manufactured is gradually becoming poorer, so that the proportion of upper grade lumber is becoming smaller and low-grade stock larger. But at the same time it would be a valuable aid in determining intrinsic values, compared with the present method, which consists of using market values as a base instead of the values established by the cost of production.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

Wanted

500,000 feet 1-in., 1½-in. Soft Elm.
700,000 feet 1-in. Basswood, Ash and Birch.
For delivery as soon as dry this year. State what you can supply and lowest prices on cars.
Box 945, Canada Lumberman, Toronto. 3-8

Wanted

Several cuts of good Maple and Beech to be sawed during Winter and Spring of 1914 in District between Georgian Bay and Toronto, also stocks of Birch from Muskoka District. Box 964, Canada Lumberman, Toronto. 4-7

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department"

Wanted to Buy

500,000 ft. log run, sawn Hard Maple, various thicknesses, M. C. out. Must grade proper percentage 1 and 2 and No. 1 Common and not to exceed 20 per cent. No. 2. Will pay cash when loaded on cars; or will buy good Maple logs in the round, 12-in. and up diameter.
Write P. O. Box No. 1595, Montreal, giving best price and rate of freight to Montreal. 2-tf.

Wanted to Buy

4/4 White Basswood.
4/4 12-in. and over wide Soft Elm.
Round Rock Elm Logs 12-in. and up diameter, 20 to 35 ft. long—admit 10 per cent. good white gray elm. Any station in Canada. Also square Rock Elm timber.
Highest prices. Spot cash.

HALL BROS.,
Manufacturers and Wholesalers.
Toronto and Marmora. 4-7

Hardwood Pickets Wanted

Beech, Birch and Hard Maple.

1 x 1 x 42.
1 x 1 x 48.
1 x 1½ x 42.
1 x 1½ x 48.
1 x 1½ x 42.
1 x 1½ x 48.

Require Thickness, 1/16-in. Plump.

Quality—Free from all defects.

Can take delivery of green or dry stock.

Apply to The Canada Wood Specialty Co., Ltd., Orillia, for full particulars, price, etc. 24-1-TF

Wanted to Buy

One million feet 1-in. Dead Cull Pine, also fifty thousand feet 1-in. Cull Spruce or Hemlock. Apply

M. BRENNEN & SONS,
Hamilton, Ont. 6-9

For Sale-Lumber

Red Pine For Sale

Four carloads 2 x 4 and up; 18 ft. to 24 ft. P. O. Box 392, Ottawa, Ont. 3-tf.

For Sale

Five hundred cords of Pulpwood ready to ship.

BOIS GILBERT MFG. CO.,
Co. Dorchester, P.Q. 6

For Sale

Cut of Hemlock near Ottawa. Will manufacture to suit buyer.

HALL BROS.,
Manufacturers and Wholesale Lumber Merchants
Marmora and Toronto. 4-7

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
Montreal, Que. c

For Sale

Cut of 100,000 ft. Pine and 50,000 ft. Spruce near Ottawa. Will cut in dimensions to suit purchaser.

A. T. SHAVER & SON,
Lunenburg, Ont. 6

\$15,000,000.00

We have about fifteen million dollars worth of timber lands for sale. Write us what you want. Dealers in timber lands, lumber yards, mill machinery, mills for sale, arranging loans, selling and exchanging cut-over lands, and a general real-estate business. If you want to buy or sell write us.

THE JANESVILLE EXCHANGE,
Timber Department,
Janesville, Wisconsin. 1-tf.

Wanted-Machinery

Wanted

Two or three dump wagons in good repair, suitable for handling mill slabs. State condition and lowest cash price.

BOOTH & SHANNON,
Biscotasing, Ont. 6-7

For Sale-Machinery

A Bargain

44-inch Wick Gang for sale at a bargain. In first class shape. Apply,

Fraser Lumber Company, Ltd.,
Plaster Rock, N.B. 2-7

For Sale

Thirty Standard Gauge Flat Cars in good condition; will pass M. C. B. inspection; 30 ton capacity, equipped with air brakes.

JOHN J. GARTSHORE,
Toronto, Ont. 5-8

Band Mill For Sale

Waterous double cutting pony, practically new and in good running order. Also filing outfit and saws.

DEVON LUMBER CO., LTD.,
Ottawa, Ont. 6

Mill Machinery For Sale

Complete saw mill plant for sale including two single cutting band mills, gang, and all equipment in first class working order. For particulars apply to the Dickson Company, Peterboro, Ont. 5-8

Straight Moulder For Sale

One 8-in. Goldie-McCulloch Straight Moulder and Matcher in perfect running condition. This machine is better than new, as the bearings and all the working parts have been tried and kept in good working order. The owner is replacing with a much larger machine. Price low.

J. RODERICK & SON,
St. John, N.B. 5-8

Woodworking Machinery:—1 No. 1 Ballantine power feed dowel machine; 1 16-in. Ideal wood lathe; 1 Hespeler improved power mortiser; 2 24-in. Ideal planers, matchers and moulders; 2 No. 619 Corporation dimension saw tables; 1 42-in. Fay power feed band rip saw; 1 36-in. Egan double drum sander.

H. W. PETRIE, Ltd., Toronto, Montreal and Vancouver.

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents.

EXPERIENCED LUMBER INSPECTOR wants position. Address Box 986, Canada Lumberman, Toronto. 6-9

Band Sawyer wants position. Single or double cut. Good references. Box 956, Canada Lumberman, Toronto. 6

Position wanted as band saw filer, double or single cut. First-class references. Address Box 972, Canada Lumberman, Toronto. 5-7

Young man wants position as Bookkeeper or Salesman in a lumber yard. Speaks English and French. Good references. Apply Box 976, Canada Lumberman, Toronto. 6

Position wanted as band saw filer, or can take full charge of resaw band. Four years' experience. Strictly temperate. State wages offered. Box 985, Canada Lumberman, Toronto. 6-8

Saw filer, band or circular, wants position. 25 years' good experience. No booze fighter. Good references. Can give satisfaction. Box 300, Canada Lumberman, 119 Board of Trade, Montreal. 5-8

Situation wanted as Sawmill Foreman or Superintendent. 28 years' experience with high capacity mills. Expert mechanic. Band mills a specialty. West of Winnipeg preferred. Box 958, Canada Lumberman, Toronto. 4-6

Wanted-Position By Experienced Manager

To take charge of lumbering operations. Can get results and furnish the highest credentials. Canadian. Box 973, Canada Lumberman, Toronto, Ont. 8

Position wanted by experienced man as sawmill foreman. Could take entire charge of small plant. Understands handling men, and also lumber from stump to market. Have had twenty-four years' experience. Married man. Can give good references. Would take contract of sawing by thousand. Address Box 656, Haileybury, Ont. 5-6

EXPERIENCED MAN wants position in charge of outside operations for lumber manufacturing firm. Fifteen years' experience in all branches of lumber business with up-to-date firms. Best of references. Box 979, Canada Lumberman, Toronto. 6-7

Bank Clerk desires position as bookkeeper or yard man with lumber company. Three years' banking experience, and has been familiar with lumber since childhood. Non-smoker and total abstainer. Best of references. Box 983, Canada Lumberman, Toronto. 6

YOU will reach YOUR man in applying to Box No. 986, Canada Lumberman, Toronto, if YOU are in need of an accurate and reliable Mill Accountant, for May 1st next. Eleven years' experience in lumber business. Highest references. Conversant with both French and English languages. Married. 5-6

BAND SAW FILER wants position. Twenty years' experience in United States and Canada. Can furnish gilt edge references. Would go where quality and quantity is wanted. Would expect highest wages. Single or double cut. Box 960, Canada Lumberman, Toronto. 4-7

Wanted-Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

WANTED—Competent millwrights to install sawmill machinery. Booth & Shannon, Biscotasing, Ont. 6-7

WANTED—A good salesman to sell stock for the Fraser Brook Lumber Company, Limited. Apply A. Lemieux, Fraserville, Que. 6

Veneer Agency

Large American manufacturer of veneers and thin lumber wants a representative to travel Ontario and Quebec on a commission basis. Exclusive territory. Apply Box 978, Canada Lumberman, Toronto. 6-7

Men for Sawmill Wanted—Engineer, fireman, sawyer, jacker, setters, tail sawyer, lath contractor, pilers and others for Band Saw Mill at Kearney, Ontario, for summer season. Cut is pine. State age, habits and firms previously employed with. None but men experienced in Saw Mills need apply. Apply J. J. Armstrong, Biscotasing, Ontario. 5-6

Business Chances

For Sale

Sawmill in good timbered district, about 50 h.p., all complete. It cost \$6,000. To close estate will sell for \$1,500. Address Box 977, Canada Lumberman, Toronto. 6-7

Wanted

party with from \$25,000 to \$100,000 cash to join the advertiser in the manufacture of a valuable timber property where the opportunities for making large profits are exceptional. Address Box 968, Canada Lumberman, Toronto. 5-6

For Sale

Timber limit consisting of 10,000,000 feet of Pine, Spruce, Hemlock and Hardwood, tributary to Lake Nipissing. Also sawmill and logging outfit, boom timber and chains. Good reason for selling. For particulars address Box 846, Canada Lumberman, Toronto. 19-tf.

If You Have a Son

whom you want to start in business, write stating the amount you are prepared to invest, his age, experience and capacity. This is an exceptional opportunity for the training and development of a young man, where the climatic conditions are perfect and the business opportunities unlimited. Address Box 969, Canada Lumberman, Toronto. 5-6

For Sale—Retail Lumber Yard and

Planing mill, \$5,000. Stock at invoice prices. Last year's business \$25,800. Natural gas power. Railway siding. 400 ft. metal sheds, etc. Caledonia Milling Co., Ltd., Caledonia, Ontario. 6-9

Saw Mill For Sale

Fully equipped sawmill, including Boiler, Engine, Trimmers, Belts, etc. Everything in running order. Capacity 18,000 to 20,000 ft. per day. Located on T. & N. O. Railway. Apply Box 984, Canada Lumberman, Toronto. 6-7

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. 11

For Sale

Rare bargain. Band mill located in best lumber and log center on Puget Sound. Rail and cargo shipping facilities. Excellent log pond. Ten and a half acres of land. Price one-fourth of appraised valuation. Must sell quick. Box 765, Canada Lumberman, Toronto, Ont. 8-t.f.

ESTEVAN, SASKATCHEWAN

Splendid opening for Planing Mill. Lumber Yard could be run in conjunction with advantage. 5,000 population; with large district to serve; cheap power, fuel, light, etc.; city growing rapidly, first-class business assured. Write immediately to the Secretary, Board of Trade, Estevan, Sask., Canada. 4-8

For Sale

Fir and Spruce Timber Limits in the vicinity of Fort George. Price right and terms liberal. Will be sold in quantities as agreed upon up to 45 square miles. Timber not excelled in British Columbia.

If interested apply for further information to

D. J. McEACHERN,
3-6 Alvinston, Ont.

**British Columbia
Saw Mill and Timber Limit
For Sale**

A 25-thousand feet capacity Saw Mill, and 90 million feet first class Spruce, Red Cedar, Hemlock and Yellow Cedar, etc., under B.C. Special License. At good shipping point near Prince Rupert, B.C. Inspection invited. A. Cuthbert, P. O. Box 456, Prince Rupert, B.C. 6-11

Fine Timber Tracts

We have a number of timber tracts for sale in most all states at low prices and reasonable terms. Have few bargain tracts that are offered for quick sale. Write us what you want, we have it.

THE JANESVILLE EXCHANGE, Timber Dept., Janesville, Wis. Dealers in timber lands, lumber yards, mill machinery, mills for sale, arranging loans, selling and exchanging cut-over lands, and a general real-estate business. 1-t.f.

Miscellaneous**Coal and Timber**

Will purchase in large tracts only, either in Canada or the United States. We are principals and only deal with owners. No agents or options. Address "Cash," c/o Canada Lumberman, Toronto. 4-7

Saw Mill Machinery For Sale

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

Processes for Fireproofing Wood

Considerable attention has been given in the United Kingdom to the best method for fireproofing wood, especially in connection with railroad construction. The following is a description of a process which, it is claimed, has received the favorable consideration of the British Admiralty.

The wood is placed in large cylinders, the doors of which are hermetically sealed. The wood is then subjected to a course of steaming, and under vacuum the air and moisture in the pores of the wood are removed and the sap vaporized. The fireproofing solution is thereafter run into the cylinders, and under pressure forced throughout the pores and fibers. Subsequently the water in the solution is evaporated in drying kilns, and the chemicals, in minute crystal form, are left embedded in the wood. When heat is applied, these crystals expand to many times their original size, forming a glassy coating to the fibers of the wood which excludes the oxygen in the air. In time the heat causes the crystals to collapse, but further crystals in the wood immediately expand, and the same process of resistance against fire continues. The chemicals used are antiseptic and preservative, consisting chiefly of phosphate of ammonia. As a result of the treatment, the life of the wood is also lengthened for the cause of decay (sap water) is eliminated. This process is claimed to be especially satisfactory, inasmuch as the material treated is not saturated with a solution of salt, nor are such chemicals used as tungstate of soda, sulphate of ammonia, sulphate of alumina, alum, etc., which invariably cause discoloration of the wood, corrosion of metals, destruction of fibers, and prevent satisfactory painting or polishing. After this treatment the wood can be worked, nailed, glued, painted, polished, etc., as though it had not been subjected to any special process. All kinds of timber can be treated.

The first railway company to take advantage of this process was the Underground Electric Railways of London, and at the present time it is stated that the woodwork of all the cars of the company has been subjected to the treatment. It is also stated that after exhaustive tests the British Admiralty has adopted the process, that the company is engaged in fireproofing large quantities of wood for 70 motor boats for the British warship Indomitable and Monarch, and that the two new super-dreadnoughts now building, the Queen Elizabeth and Warspite, are to have their woodwork fireproofed by this process.

The company using the process states that as a result of the re-

cent disaster at Aisgill, the Midland Railway (on whose system the accident occurred) has requested the fireproofing company to submit a tender for erecting a fireproofing plant at the company's works in Derby.

There is another fireproofing process known as the "Snowdom process," the chief feature of which is a chemical mixture, but the formula is not disclosed. By the use of this mixture it is claimed that woodwork and all manner of fabrics may be rendered non-inflammable and insect proof. In the case of wood already in position, it may be painted or washed with three or more coats, according to density, when the solution penetrates to a depth of about one-eighth of an inch. When treated prior to construction, the wood is usually soaked in the solution in tanks, but if it is desired to render the wood fireproof throughout, pressure cylinders are used to force the liquid into every fiber.—Consul General John L. Griffiths, London, England.

Tamarack Commercially Extinct

"The large larch sawfly," says the Dominion Entomologist, "has destroyed between fifty and one hundred per cent. of the native larch, or tamarack." Every farmer in Eastern Canada has observed this mysterious killing off of the tamarack in the low-lying portions of his woodlot. Mr. J. B. Tyrrell, who recently explored the new District of Patricia for the Ontario Government, reports on the large numbers of the tamarack in that region, but says, "Unfortunately most of the trees are dead." Through the continued attacks of a single forest pest, whose ravages it is now impossible to control, one of the most valuable timber trees of Eastern Canada is now in danger of extinction.

In British Columbia, forest insects have destroyed in some places over twenty-five per cent. of the timber crop. Technical foresters in the employ of the Dominion Forestry Branch have noted similar depredations, when conducting forest surveys in the Northwest. Similar conditions prevail in the United States, where on some of the National Forests the damage done by insects last summer far exceeded that done by fire. H. S. Graves, Chief Forester of the United States, says: "A few isolated trees attacked by insects may form the nucleus of a devastation quite as serious as that from forest fire."

It is very likely that in Canada as much damage is done to the standing timber by forest pests as by forest fires. Fortunately the former are largely dependent for their existence on the latter, for fire furnishes the chief feeding and breeding grounds to the in-

sect foes of the forest. Thus the Dominion Forestry Branch, by reducing the fire-burnt area on Dominion forest reserves last summer to less than two one-hundredths of one per cent. (0.02 per cent.) has succeeded in "killing two birds with the one stone." One of the foresters, describing how this is accomplished, says:—"Fire minimizes the vitality of the tree and climate takes advantage of the weakness, thereby creating a condition favorable to insects and fungi. By minimizing the damage done by fire and handling the various stands according to one of the silvicultural systems suitable to that type the result can only be strong, vigorous trees better equipped to withstand all natural enemies."

Briquetting Sawmill Waste

Many attempts have been made in the past to produce a practical fuel from sawmill waste. According to the report of Mr. R. S. Hamilton, of Vancouver, B.C., a briquetted form of wood waste, is now being produced which is held together by a piece of hemp rope running through the centre. The fuel can be manufactured at \$3 a ton and many advantages are claimed for it. According to tests which have been made, these briquettes, produced from mill waste, contain 8,614 B.T.U. to the pound and produce practically no ash in burning. The method of manufacturing is as follows: The refuse, including bark, slabs, sawdust, shavings, etc., is passed through a hog or edging cutter, where it is cut into pieces about three quarters of an inch long. This material passes to a shredder where it is shredded into fine particles about the thickness of a match and from that up to about a quarter of an inch. From the shredder it passes to a dry kiln. Drying is necessary because green fuel will not stay in shape. The bond is a jute string about seven-ply tarred. A plant is now being erected on the property of the Cameron Lumber Company, at Victoria, B.C.

Review of Current Trade Conditions

Ontario

No important movement, one way or the other, has been shown by the lumber trade in Ontario during the past few weeks. There appears to be no more demand than there was a fortnight ago, although there is a little more enquiry. The volume of sales, however, shows no noticeable increase. There is quite a unanimous opinion, on the other hand, that trade conditions will be fair this spring. The building situation, easier money and the general attitude of the banks toward industry and trade all point in the direction of considerable improvement. There is no apparent shortage of good lumber stocks although they are not quite as plentiful as they were a year ago. Hemlock is about stationary and stocks are not large. The same thing applies to spruce and there is no change in prices. Lath are scarce, No. 1 particularly. Shingles are about steady and the demand is moderate, as is to be expected at this time of year. Retail yards throughout the province are still carrying light stocks which will require immediate replenishing, as soon as the building activity commences.

Sales of 1914 cuts are reported from Ottawa, at prices showing a slight advance over last year. Most of the sales have been for mill and dead culls in spruce and red pine. Middle grades and white pine continue firm. The sales, so far, have been to Montreal, Ottawa and Toronto firms. Sales to the United States are still rare. Local trade at Ottawa is quiet.

Eastern Canada

None of the St. John mills have started sawing yet, and trade continues quiet. The end of March, however, will probably see a start made at one of the mills and others will start early in April. The remainder will wait for the melting of the ice at South Bay, probably about the middle of April. English deal prices show no change, but freights are lower. A reduction is reported in stocks at Liverpool and Manchester, but they are still heavy. Stocks of deals at St. John are rapidly declining and mill yards are practically out of low grade lumber. The demand for building material is very light and factories report very little new work coming to hand. The market for future delivery to the United States is very quiet. Two-inch stock remains at a base price of about \$25 delivered New England points. Lath for 1914 delivery have sold at \$2.85 on the wharves at St. John. Most of the mills, however, are holding for \$3.00. There is a good demand for shingles, but stocks are nearly cleaned up. New stock will not be ready till midsummer. Box shooks are in slow demand. The cut of logs appears to be about normal, but prices are very high.

Better times are expected by eastern spruce firms at Boston in the near future. Most of the dimension business of late has been on a \$24 flat Boston rate. Prices for random are fairly steady. The best sellers have been 2 x 3 and 2 x 4 and there has been little demand for 2 x 10 and 2 x 12. Carload lots of 2 x 4 have been selling at \$22, and 2 x 3 at \$21. For small lots shipped in with frame, 50c a thousand better has been obtained. The quotation for 2 x 5, 2 x 6 and 2 x 7 is \$20 to \$21; 2 x 8, \$22.50 to \$23; 2 x 10, \$24 and 2 x 12, \$24.50. The bottom price for 9 in. frames has been \$25; 10 in. \$26 and 11 or 12 in. \$27. Transactions in random spruce covering boards have been scarce, the top price being \$22.50, some sales being put through at \$22. Prices for No. 2 matched spruce are unchanged at \$24.50 to \$25 and the demand is light. The demand for hardwoods, with the exception of plain oak, is poor. Stocks of hemlock boards in the east are reported light, and manufacturers are asking \$24, although actual selling prices are nearer \$23. It is expected that the renewal of the building activity will strengthen this market, on account of the light stocks.

United States

The activity in general trade conditions which developed during the month of January in the United States did not hold its volume to the end of February and reports at the close of last month indicate that business in general was on a basis rather similar to that of last fall. Steel and iron buying fell off, although this was predicted in January. On the other hand prices of pig iron showed an upward tendency early in March, the first time in five months. Lumber trade conditions, however, continue fairly favorable, in spite of severe snow storms and cold weather, which have reduced the quantity of traffic. Most of the business at present is on a basis of current requirements, but the approach of spring brings indications of a widening in trade channels. Most of the dealers continue cautious, but in many of the large interior cities building permits are increasing and give promise of an extensive demand for lumber. This should have a good effect upon the market, especially for southern pine. There is a fair amount

of buying in progress on behalf of the manufacturing industries. The yellow pine business during January was heavier than during that month in the preceding two years. Prices are reported to be from 50c to \$1.50 higher on dimension and a few other items. Altogether, southern pine is doing better than for several months. Conditions on the Pacific Coast show very little change. There are a few more orders than formerly, but they have only kept pace with the restricted output.

Stocks of northern pine in retail yards are reported to be low, although very little buying is in progress. The arrival of spring is expected to force the yards into the market in a rather extensive manner. Winter logging in Northern Michigan and Minnesota has been very active, although a considerable shortage in the input is expected. Enquiries from eastern buyers indicate that manufacturers will be cleaned up on their lower grades at an early date. The demand for hemlock in Wisconsin and Michigan and at lake markets is heavier. Most of the northern mills have badly depleted stocks and some are asking an advance on nearly all items. The supply of hemlock boards in the east is light, but the demand is small and prices are unchanged. The demand for eastern spruce is light and reports indicate that manufacturers are allowing stocks to accumulate in the expectation of a better demand a little later on.

Hardwood markets are reported very active. A growing movement is noticeable in the leading kinds of southern and northern hardwoods. Consumers, however, are still buying cautiously and avoiding accumulations. More attention than usual has been given to oak, plain red leading the list. Prices are firm. Plain quartered oak has also improved. There is a steady demand for ash at good prices. Birch, maple and elm are all selling well.

Great Britain

Little change is reported in the London spot market during the last fortnight. Spot stock is leaving the docks at a fair rate and the various London trades are using a good quantity. Forward buying is still in progress, but is confined chiefly to covering actual sales, especially in Russian stocks. The deliveries at London docks for the week ending February 22nd amounted to 3,467 standards, as compared with 4,014 standards during the corresponding week of 1913. At Churchill and Sim's recent auction sale, 3 x 9 in. third Quebec pine brought £14 and £13 15s. 3 x 9 in. second Quebec regulars sold at £12 and 10 and 11 in. at £11 10s., with Montreal at £11 5s., thirds at £10 15s. and third Quebec regulars £11 5s.; 3 x 8 and 7 in. third Quebec regulars brought £10 and £9 10s. Prime unsorted British Columbian pine 6 x 16 was sold at £13 10s. to £12 10s., 6 x 12 brought £14 5s. to £13 15s., 5 in. £15 to £14 15s., 4 in., 5s. less.

Spruce deal c.i.f. transactions at Liverpool are still confined to liner parcels sent on consignment, and no change in prices is reported during the past three or four weeks. It is reported that one or two cargoes have already been placed, but prices have not yet been mentioned. Spot prices continue firm and are likely to remain so until the season opens, as present imports are not quite keeping pace with the consumption. Importations of spruce deals from St. John and Halifax continue light, as shippers are apparently holding off until conditions are more definite. Canadian pine deals, boards and sidings are quiet. Very little trade in birch for future shipment is reported from Liverpool. Spot values are quite steady and the demand is fair. There is a fair enquiry for fresh logs from St. John and Halifax, and there would probably be a ready sale, at a reasonable figure, for a parcel of good St. John planks, stocks of which are gradually being reduced at Liverpool.

The improvement recently reported in the trade at Glasgow still continues, both in regard to consumption and enquiry. A moderate business is in progress in spruce, from stocks, at steady prices. There is a good request for 9 in. up x 3 in. and the stock is now very low.

Car Companies Expecting Improvement

One of the largest car manufacturing companies in Canada, in a letter to the Canada Lumberman, under date of March 9th, referring to a proposed article describing the company's operations, says that such an article "would very likely be more interesting when the car companies are busy on freight car work and using large quantities of native woods, which I trust will be the condition before very long."

Canada has 23 million acres in timber reserves, as compared with 187 million acres in the national forests of the United States.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

Ottawa Stocks Selling at Slight Advance

Ottawa, March 9th (Special to the Canada Lumberman): Within the past two weeks, several local lumber firms have made large sales of this year's cut at prices from 5 to 8 per cent. in advance over last year. The stock sold includes for the most part, mill culls, dead culls, spruce and red pine. Middle grades and white pine still hold firm, but considerable movement is expected in these later in the summer. Most of the purchasers have been Montreal, Ottawa and Toronto dealers. Few have been from the United States.

Locally trade is quiet, but it will not be long this way with spring approaching. There have been no changes in manufacturers' prices this month. Conditions in the woods are exceptionally good just now. Full crews are working in all the camps and indications are that they will not break up until the last week in March or the first week in April. Indications are that the cut this year will be considerably greater than it was last year.

The new Parliamentary Committee on Forests and Waterpowers held its first meeting in the House of Commons last week. The committee is formed to gather information on all matters pertaining to forest protection, reforestation, conservation of waterpowers, etc., and to gather this information it has been decided to call in a number of experts, among whom will be: James White, Deputy Minister of the Conservation Commission; R. H. Campbell, superintendent of the Forestry Branch of the Department of the Interior; Sir Richard McBride, Premier of British Columbia, who will be in Ottawa in two weeks' time, and others.

The election of Mr. Gordon C. Edwards, of Ottawa, to the Presidency of the National Wholesale Lumber Dealers' Association, at the convention in Buffalo last week, has brought him many congratulations from his friends. Mr. Edwards, who is general manager of the W. C. Edwards Lumber Company, is the first Canadian to be given this honor.

St. John Market Still Inactive

Fredericton, N.B., March 5th; (Special to the Canada Lumberman):—The market at St. John is still inactive as far as manufacturing is concerned. None of the mills have yet started up, but it is said that Messrs. Randolph and Baker will begin sawing on or about the 20th of this month. The Stetson Cutler & Company, Pleasant Point mill will begin operations on or about April 1st. The rest of the mills will begin to saw on or about the middle of April or just as soon as the ice melts in the booms at South Bay, which usually opens on or about that date. About all the mills are supplied with logs for early sawing, and have enough stock of logs on hand to keep them going up to the time the booms at Fredericton will begin to turn out logs, which will be about the first of June.

Prices for deals, to the English market remain about the same as at last writing, while there has been a further reduction of freights. No advance on deals has taken place. Stocks at Liverpool and Manchester have been reduced by about ten millions, but are still very heavy, much in excess of this time last year. The stocks of Baltic deals on hand at the same ports are also very heavy but it is said that no stocks of deals remain on hand at the Baltic ports, practically all having been shipped last fall before closing of navigation. This should have a good effect upon the New Brunswick deals, as, if stocks of Baltic are light at the mills, there will be no shipments for England until late in the season, and prices for New Brunswick deals should continue firm at least, for early shipment. Stocks of deals at St. John are fast being depleted and by the opening of navigation about all will have been shipped out. The mill yards are now practically cleaned of all low grade lumber and no stocks will be ready for at least three months. Small quantities of this low grade or refuse lumber are coming in on cars from the portable mills along the lines of the railroad, but the quantity is very limited. The demand for building material has been extremely light during the past four weeks. Very cold weather, aggravated by shortness of money on the part of real estate firms and builders, has practically caused building or repair work of any kind of stop. The factories report that very little new work is coming to hand, and they are simply keeping their hands employed making up stock material in preparation for future building when warm weather begins. The only building of any size which is now being figured upon is the new Tuberculosis Sanatorium to be built in the rear of Douglas Ave. This will take up about one hundred and fifty thousand feet of lumber. The contracts have not been let up to date. While large amounts of plans for house building are in hand,

very little of it has been let to anyone. The builders seem to think, in many cases, that the figures are too high, both as to material and labor, and in many cases are abandoning the idea of building.

Prices for future deliveries for the coming season, to the American market, are not in any way enticing. Very few, if any, of the mills here have sold any of their stocks for delivery during the coming season, preferring to wait until some further improvement takes place, or some definite signs of improvement appear. The base price of two-inch remains at about \$25 delivered New England points, but there is very little to offer either from here at the present time or through Nova Scotia, about all the mills preferring to cut English deals. Some laths for coming season's delivery have been sold for \$2.85 per thousand, on wharves here, but most of the mills are holding out for \$3.00 per thousand on wharves here. Shingles for present delivery are in good demand but stocks are about cleaned up, and no stocks will be ready until midsummer. The box shook trade is not so good as it has been, caused by the restricted business all over the country. Labor is plentiful, but work is scarce, and the probabilities are that the men and their employers will be better contented this season than last.

About all the logs have been delivered from the yards to the banks of rivers, lakes and streams. The cut of all logs, if they should all be driven out of streams will be normal. Prices are very high, the highest that have ever been paid on the river, the reasons being that stumpage is becoming very scarce and the needs of the plants are more than the crop of logs. For bank logs, \$14 is being paid for spruce deal logs and \$10 for spruce batts., while logs from the upper St. John are being quoted at around \$14.50 per thousand. These prices will not leave any great profits for the mill owners, neither is there any fortune in them for the woods operator, as wages and conditions are very much against him.

Encouraging Improvement at Montreal

Montreal, March 9th (Special to the Canada Lumberman): There is practically no change in the lumber trade situation. The weather has continued cold, and has to a large extent retarded the commencement of extensive building operations, nevertheless, business is picking up in a very encouraging fashion. So far, the building permits have shown a falling off; for last month they totalled \$496,055, a decrease of \$151,912 as compared with February, 1913, and for the two months of this year the value is \$906,700, a decrease of \$198,597. Dimension timber is slow, owing to the fact that contracts have not yet been commenced. Hardwoods are in fair demand, and prices keep firm.

Ground wood is pretty well sold, so far as fresh ground pulp is concerned, and some of the old stocks on hand are diminishing. It is probable that the market will be strong until the spring freshets in the United States take place. Indications are that 1914 will be a quiet year for ground wood, on account of heavy output of news print by Canadian mills, which will displace United States news print. Chemical fibre is having a steady sale, the outlook being satisfactory. The exports during the last three months were double those of the corresponding period in the previous year.

Canadian news print mills are running full and shipping their whole tonnage. The Rainy River mill will commence operations in May, with a daily output of 150 tons. The Belgo-Canadian Company have ordered a Walmsley Machine, with a capacity of 50 tons per day, from England; while Price Bros. are likely to instal a 50-ton capacity news machine at Rimouski. The Donnacona Company will probably put in another machine at the end of the year, and it is stated that other companies have under consideration extensions to their plant. It is probable that, within a few months, about 825 tons of news print per day will be added to the output of Canadian mills, the present production being about 1,300 tons per day.

The customs department appears to be inclined to a rather strict construction of the tariff provisions admitting free Canadian lumber, says a United States exchange. Novelty sidings intended to give a shingled appearance to the outside walls of a house were recently assessed 15 per cent. ad valorem as "manufactures of wood" instead of being given free entry as "wood not further manufactured than sawed, planed, tongued or grooved."

Apple wood is the favorite material for ordinary saw handles, and some goes into so-called briar pipes.

SATISFACTION FOR SALE

OUR Lumber is manufactured with a Purpose. From the Stump to the Finished Product this Purpose is never forgotten. We aim to make our Products and Satisfaction synonymous. We want every car we ship to be filled not only with Lumber but with Satisfaction.

We are equipped to give you uniform grades—dry stock—fine planing mill work—good service and courteous treatment.

When buying of us, your worry, your anxiety, is over with the placing of the order. You know you will get what you want—in the way you want it—that upon arrival, you will be pleased. It will make your business a source of pleasure and happiness.

THEIR ORIGIN, VALUE AND
USE—COMMENT AND VIEWS
ON AN IMPORTANT BRANCH
OF THE TRADE.

A Question of Veneer Trimming

One of the questions of the day which is pushing itself forward noticeably is that of veneer trimming—when and how often veneer should be trimmed between the time of cutting and its final use, says the Hardwood Record. Usually the veneer user passes this question by on the theory that it is no concern of his when or how often veneer is trimmed just so he gets the material in shape and size to suit his need at the time of using. It does interest the veneer user, however, as well as the veneer maker, mainly because it is a question of utility or efficiency in utilizing timber, but also partly because there is involved a matter of getting the veneer to be used in exactly the shape that he wants it.

To understand this matter of trimming veneer, what it means and all its aspects and the when, why and how of it, we must go back to the time and place of its production and then follow it through to the finishing room.

Usually when rotary veneer is being made there is a part of the end of the block that is trimmed off in the process of cutting, being separated from the main sheet by what are termed score knives. This gives a veneer product which consists of a straight sheet or ribbon of veneer uniform in width or length and with the ends trimmed exactly square with the cutting and parallel with each other. It naturally makes a more presentable sheet of veneer than if the score knives were not used and the entire face of the block were peeled off because then there would be some irregularity in the width of the ribbon or the length of the veneer, and this is objectionable in a way.

Usually when the veneer is peeled out in this way it is cut up into dimensions of some kind. One may make it a business to cut to a size that will allow for shrinkage in drying and the final trimming to the exact dimensions required. Another may clip his veneer out in long sheets, as long as can be handled, and dry these sheets before clipping to dimensions.

In following this process the first noticeable feature about it is the waste incident to the end trimming by the score knives. This waste varies from one inch at each end to as high as three and four inches, sometimes, and in the course of a day's run it counts up considerably. If the logs are brought into the veneer mill in long lengths and are freshly cut with a drag saw before working, it is practicable, by careful attention, to reduce this end waste to a minimum of approximately one inch to each end. Where the logs are cut to short lengths in the woods, however, there is some checking in the ends and for this reason a more liberal allowance is made for end waste, the allowance being approximately three inches for each end.

One might well argue that it is immaterial whether this extra end length is trimmed off and thrown in the waste pile at the veneer machine or afterward. Indeed, one might urge that the sooner it was trimmed off and disposed of the better because it saves the handling of the waste through the driers and the trimmers and so on; but another factor enters there, which concerns the veneer user as well as the veneer manufacturer. It is the factor of shrinkage.

Veneer does most of its shrinking, though not all of it, sidewise. This is well known and understood. But the side shrinkage is not always uniform. There is some end shrinkage and there is also enough irregularity in the side shrinkage to draw the ends out of square and make another trimming necessary to straighten them out.

There have probably been wrangles galore over this matter of end shrinkage in veneer, mainly because we are too much in the habit of taking the attitude that end shrinkage is small, insignificant, and therefore needs but little attention. It is a known fact that where men are cutting drawer bottoms or other single ply stock to fit into grooved spaces neatly and cutting to exact dimensions with score knives at the veneer machine, it often turns out that the stock fails to fit. It will be short in length, it will be found so out of square that the sides and ends will not fit up at the same time. Then will come the charges from the user that the veneer manufacturer did not cut to specifications, and the veneer manufacturer will accuse his veneer cutter of carelessness in following instructions as to length.

The only way to get exact dimensions in veneer is to make those dimensions after the veneer is thoroughly dry. Cutting to specific dimension in either length or width before drying will result in disappointment if the requirements are very exacting. To give satisfaction where the requirements are exacting as to dimensions, the trimming to size must be done after the veneer is thoroughly dry, and generally it is best to do it with saws. Some thin veneer is cut

both crosswise and lengthwise with knives but to get the best results in trimming veneer to size the ideal way, either with thin veneer or thick, take it in bulk and trim it with saws.

This being true, the question naturally rises as to whether veneer should be trimmed twice or only once, whether it should be cut to length with score knives and made long enough for a re-trimming, or whether the score knives should be abolished and one trimming made to do it all.

The answer to the question depends somewhat on circumstances. Some trimming is quite often essential before drying. This is true especially of side trimming. Sheets of veneer must be cut to some sort of dimensions so that they can be handled, and in cutting to these dimensions notice must be taken of the final size requirements and allowance made for shrinkage in drying and for the final trimming to size. It requires the exercise of some care in making this allowance to prevent unnecessary waste on the one hand and to prevent an unusual amount of culls through lack of width on the other hand.

The usual allowance for shrinkage in width is ten per cent.—one inch for every ten. Some woods, notably maple, will not shrink this much, but gum will come very near it. The shrinkage allowance would be the same whether the veneer sheet is cut up into individual sizes or into sheets of two or three sizes. If the final dimensions are small, however, a saving in trimming allowance may be effected by handling the sheets in multiples of the final size.

In the end shrinkage and allowance for trimming we might argue that since there must be a final trimming after drying, the score knives should be taken off and let the full length of the block into the sheet with all its variations in alignment with the sheet. This argument is good, too, where the veneer is being dried, shipped and handled single ply. It involves only the drying and shipping of that extra length, and in return the extra length insures better stock after the final trimming and more room to do the trimming.

If the veneer is to be worked up into panels or built up lumber, however, there is the factor of glue, which cuts some figure. The economy in glue is just as important as economy in veneer, consequently the gluing up of two or three inches of extra length of veneer on each sheet and then finally trimming it off and throwing it away means the waste of quite a lot of glue, which is objectionable.

The ideal plan here would seem to be that of using the score knives to reduce the sheets to something near the end length desired and to eliminate the burden of the waste, while at the same time leaving enough length for the final trimming to exact size.

If the right kind of efficiency and utility were practiced at the veneer cutting and logs brought in in full length and carefully squared to length and as carefully handled in the machines, it should be possible to so reduce the allowance for end waste that it would not be necessary to use score knives and no trimming need be done on the veneer until after the final drying, other than that of chopping it up into sheets of a size that can be handled.

There is to-day a pretty strong disposition to abolish as far as practicable the trimming of green stock to exact dimensions with score knives and clipper and to run out the full sheets, dry them and then trim to exact dimensions. Where the veneer user is buying his stock in plain sheets that are to be trimmed to exact dimension before using he is perhaps better off in buying stock that has not been cut to length with score knives for it will give him room for trimming, and enable him to get a degree of precision in length that is not possible in trimming green stuff with score knives.

Arrangements for Hoo-Hoo Annual at Winnipeg

Canadian Hoo-Hoo, including Senior Hoo-Hoo Tenant, Vicegerent Snark Dutton, of Manitoba; Vicegerent Robinson, of Western Ontario; Vicegerent Cooke, of southern Saskatchewan; Vicegerent Manning, of northern Saskatchewan; Vicegerent Birnie, of Alberta, and several former Vicegerents recently met at Winnipeg, Man., to formulate plans for the twenty-third annual meeting of the Concatenated Order of Hoo-Hoo, which will be held in that city September 9, 1914. The meeting was called to order by Vicegerent Snark Dutton, who, in the course of his remarks, eulogized those who went to St. Louis last year and secured the annual for Canada. He called especial attention to the fact that the meeting would be of international interest, members from the United States and eastern and western Canada participating in the event.

Retailing Lumber at a Profit

By C. L. Wright, Fairfield, Ia.

One of the most important reasons why so many high-class men and so much capital are engaged in the retail lumber business is that when rightly conducted it pays a very fair profit.

The making of a profit is no mysterious, elusive thing. Not only must first cost or purchase price be known, but also the cost of conducting the business, before it can be definitely known that a profit is being made and just what that profit is. Frequently sales price is made up by adding a percentage to purchase price. Goods sold on such a basis may or may not show a profit. An expense book with all items paid out entered, totaled for the year will give the cost of doing business and the relation to first cost gives the percentage. Only two of these costs will be considered here. If the owner is manager he should add to the total expense a fair amount for his salary and figure interest on his investment. Sales price made up in this way consists of three factors: Purchase price, operating cost and margin, added for profit.

When once determined upon, sales price should be the same to all alike. It is both fair and easy to make quantity discounts. Do not hesitate to ask and get a fair price and when price has once been given abide by it. Allow neither competition nor customer to make the price for you.

Certain interests have been very carefully keeping before the public the idea that the lumber industry is a highly organized business and that organization effected solely for the purpose of taking exorbitant profits. This idea has been fairly prevalent and the lumberman himself has frequently unconsciously lent his efforts toward convincing his customers of the truth of that view. Especially is that the case where the lumberman is timid or over anxious. A customer brings in a bill and intends to buy as cheap as possible. Of course he makes every effort to foster the idea of keen competition and low prices to get the business. Should the knife be lifted upon prices and a cut be made possibly several times, the bill may ultimately be sold at no profit or even at a loss and the customer be absolutely convinced that a fair profit is left and that the first price asked was a holdup.

If good material is kept in stock and a fair profit is added, emphasis may be placed on quality and by showing the lumber to the prospective purchaser attention is focussed on value instead of price. Two cases coming to my notice will illustrate. The customer came into the office with a small bill and stated that he already had figures on it and wanted the best price this lumberman could make. The bill was figured, the customer was taken out to inspect the material, and then the price was made. "Too high" said the buyer. "Can't you cut it?" He offered to cut both price and quality but staid by the first price made on the list submitted, though several attempts were made to get a reduction, and finally sold the bill, because, though the bill was high the material was good and just what he wanted. He was satisfied that the material was worth the price asked and the lumberman's refusal to lower the price helped fix that idea.

The second case was that of a large barn bill brought in by a farmer who usually traded with another dealer. The lumberman selling the bill has one price for all with quantity discounts. The bill was figured on this list and the price made with emphasis on value. The bill was finally sold on the first price made though it was higher than the other dealer's price. When urged to meet the lower price the lumberman replied that he was selling his own goods, that he knew the cost and the price was very fair on this grade of material, that he never attempted to fix a price on another man's lumber or take any man's price on his own goods. "You have seen the material and know it is good" he added. "Bring in your teams and haul it out," and the bill was sold. The man was not only satisfied but became a permanent customer. Too low a price must be unfair to some customer because it means an added amount later to balance up. To sell too low is as morally reprehensible as to get an exorbitant profit.

The fact that bills are usually sold on a closer margin than yard trade has led to fixed terms on estimate business. Yard trade is sold on the list. When cash it is profitable. If it is credit trade however it costs heavily in attention, bookkeeping and collection. This credit trade does not pay as it should and is frequently sold on very loose terms or on no stated terms at all. The customer comes in with a list of his needs and the statement that he can't pay for the material just now only to be told that it is all right, to take the goods along and pay whenever it is convenient. On such terms he may justly feel grieved if a statement comes along in thirty or sixty days. And why not? He was given all the time he wanted and is now asked to pay. If \$25 be obtained at the bank the terms are fixed and clear as if the loan were \$2,500. Regular terms tend toward cash purchases and the habit of early settlements. It ought not to be difficult to learn when the customer expects to settle and to state the terms of sale.

Fixed terms of sale help to make collections much easier than when the terms are loose or there are no terms. A policy of cash or early settlements affords opportunity to check up the new customer

who may have a tendency to over-extend his credit. A clear system of records aids on collections by helping to keep out errors and also in making the dealer know just where he stands. There is no golden rule for collections but there is a great deal to be said in favor of doing your own collecting. Do not turn your accounts over to a collection agency. Be just as free to ask for a settlement as your customer was to ask for the credit.

There is a collector in this district who has an enviable record. His plan is to collect one account at a time and to forget all others while making this collection. In order to make his debtor feel his particular account must be settled he never presents a statement but carries the amount in his head. When he has not met the man before, he goes out alone and introduces himself as representing his company which usually brings about an opening. Settlement is asked because the account is due and in a large majority of cases he succeeds. Checking by my own experience, I know that taking out a number of statements, I would be satisfied beforehand if I made 65 to 75 per cent. of the collections and that would be about what I would collect. Too much credit sometimes actually results in a loss of business. A customer will buy along until he has quite an account. It isn't convenient to settle the whole account and he knows it ought to be paid. Expecting that he will be asked to settle in case he goes to the lumberman he owes, he will go to his competitor and pay cash. This loss of business should be figured in as one of the costs of credits and there are several others. Credit on small trade will amount to a fair percentage of the year's business. Were all business cash, bookkeeping costs would be greatly reduced while collections and losses from unpaid accounts would stand no cost at all, and the profits from the turn over by virtue of having this money actively at work should be largely increased. Conversely with many credits these profits become losses.

Good clear records help to keep down outstandings and to make settlements easier in the case of disputed accounts. Let me suggest a loose leaf double entry ledger with transfer binder, as simple a journal as will serve your needs. It should show itemized sales both cash and credit, receipts and expenses, and may also show profit balance and stock sheet, and a daily sales book with duplicate or triplicate carbon copies, one page to each customer. In the case of credits or payment on account, the original is to be filed in an envelope filing system alphabetically arranged and the duplicate filed in a dated envelope, if a statement is to be sent out in 30 days. Such a system by collecting credits and debits will reduce the work of statement making fully 50 per cent. Cash terms filed in dated cash envelopes would make the system and records complete. Outside of the line yard concerns this seems to me to be one of our greatest weaknesses as business men, the keeping of a poor set of records. Between a good and a poor system of records there is all the difference between a profit and a loss. System tends toward knowing while no system leads to confusion and loss.

Of the several ways of making more profit theoretically the easiest way is to increase the margin. Practically that may not be advisable. Reducing operating expense will affect the balance at the end of the year's business in the same way and not offend the trade. The cash discount should always be taken. It will amount to a very considerable sum. When not taken it means an added expense of at least 12 per cent. Demurrage is another loss which is equal to a profit when saved. Not only unload so as to avoid demurrage payment but help others by unloading and releasing the cars in half the time allowed whenever possible. One very great saving has generally been given little consideration. The trade papers touch upon it but many of the suggestions have failed to get into actual practice, and that is a time study of every operation from unloading the car to stacking and getting the material on to the job, looking to an elimination of all waste motions and effort and a standardization of the world. The saving of this one association could not be estimated. A similar study of office methods and records and stock arrangements would be as valuable. I hope some time to see such a study made. It would mean a tremendous saving in time, effort and expense.
